DETROIT, Jan. 30—The Ford Motor Co. has completed arrangements with Holley Bros. by which the Ford company acquires patents under which the Holley carbureter is produced, and also the factory in which Holley Bros. have been operating. The Holley Kerosene Carbureter Co., which was formed last December, has purchased from Holley Bros. their rights to the Holley kerosene carbureter and what remains of the gasoline carbureter business not sold to the Ford company. The Holley company will continue to manufacture carbureters.

—

Lilly Made Director of Embarkation

WASHINGTON, D. C., Jan. 28—Brig. General Chauncey B. Baker of the Quartermaster Corps has been relieved of certain duties connected with embarkation by the appointment of D. M. Lilly of New York as Director of Embarkation. Gen. Baker is the Chief of Embarkation in addition to heading the truck transportation work, which latter is not in any way to be affected by the appointment of Lilly.

—

Argentine Sales Outlook Is Good

BUENOS AIRES, ARGENTINA, Jan. 20—With Argentine crops expected to establish a new record for the coming summer, midsummer here being January, the sale of automobiles to the Argentine farmer should show a great increase over previous years. The farmer still continues the great center of sales in Argentina, although in the streets of Buenos Aires the number of American cars is increasing. The war has strengthened the motor car industry in Argentina owing to the shortage of farm labor and the consequent necessity for motor apparatus to make up this shortage.

During the months of October and November and during the winter months of June, July and August, the sale of automobiles was slow, and in many places entirely stagnant owing to general unrest as well as the series of railroad and other strikes.

An example of American methods of merchandising was the convention of Overland dealers held at the Plaza Hotel in this city. It was the first South American Overland convention, and demonstrated the value of such conventions in South America as well as in North America.

—

Kelly-Springfield Profits $2,700,000

NEW YORK, Jan. 29—The Kelly-Springfield Tire Co. has just closed its most prosperous year with net sales aggregating $14,000,000, and profits, before deducting taxes of $2,700,000. Allowing $210,000 for the preferred dividend, almost $2,500,000 remains for $5,000,000 common stock—a return of 50 per cent, or $12.50 a share. After the war tax is deducted the profits of the company will be about the same as those for 1916, and approximately equal to the total sales of the company 5 years ago. More than 2200 pneumatic tires are being turned out daily, as compared with 1400 a year ago.

Exempt 124 Plants in Michigan

Monday Closing Order Rescinded Where Government Work Is Being Done

DETROIT, Jan. 28—One hundred and thirty-four factories in Michigan have been granted exemption from the Monday closing rule. These exemptions are granted for the department engaged in the manufacture of materials for the government, either for the War Department, the Navy or the Ordnance Department. In addition to being exempted from the closing orders, these plants are given preferred priority for coal shipments and outrank other manufacturers in this line, although this coal must only be used for the government work.

A general order also covers all airplane manufacturing plants, all shipyards and the manufacture of explosives of all kinds. Coal to relieve the situation, and particularly to prevent delay in government work, is on its way to the interior of the state. This is coming over all lines of railroad, and indicates that it is passing the blockaded gateways.

The list of plants partially exempted includes the following from the city of Detroit:

American Auto Trimming Co.
American Brass & Iron Co.
American Car & Foundry Co.
Armour Packing Co.
Anderson Forge & Machine Co.
Barcey, Nicholdon Co.
Blodgett Engineering & Tool Co.
Briggs Mfg. Co.
E. S. Bryant Pattern Co.
Burton & Lowrey Co.
Cadillac Motor Co.
Cadillac Tool Co.
Charcoal Iron Co.
Arthur Colton & Co.
Continental Motor Corp.
Covert Gear Co.
Detroit Auto Specialties Co.
Detroit Brass & Copper Rolling Mills
Detroit Chemical Works
Detroit Gear & Machine Co.
Detroit Motor Castings Co.
Detroit Pressed Steel Co.
Detroit Screw Works
Detroit Steel Products Co.
Detroit Storage Battery Co.
Detroit Tool Co.
Dodge Brothers
Eastern Production Co.
Eclipse Counter Bore Co.
Edmunds & Jones Corp.
H. E. Edwards
Excelsior Tool & Gage Co.
Fisher Body Corp.
Ford Motor Co.
Gemmer Mfg. Co.
General Aluminum & Brass Mfg. Co.
General Electric Co.
General Motors Corp.
General Spring & Wire Co.
Goddard Tool Co.
Great Lakes Engineering Works
Hanson Tool & Die Works
Hayes Manufacturing Co.
Hinkley Motor Corp.
Hudson Motor Car Co.
International Metal Stamping Co.
King Works
Kraetke Bros.
...ncoln Motor Co.
Long Manufacturing Co.
McCord Mfg. Co.
Massnick Manufacturing Co.
Maxwell Motor Co.
Michigan Bolt & Nut Co.
Michigan Electric Welding Co.
Michigan Malleable Iron Co.
Michigan Stamping Co.
Michigan Screw Machine Co.
Michigan Tool Co.
Modern Pattern Co.
Monarch Foundry Co.
D. W. Murray Co.
National Can Co.
National Machine Products Co.
National Twist Drill & Tool Co.
Oldberg Manufacturing Co.
Packard Motor Car Co.
Paige-Detroit Motor Car Co.
Peninsular Machinery Co.
Pittsburgh Shafting Co.
Buhl Malleable Co.
Schweppe & Wilt Co.
Semet Solvay Co.
Standard Brass Works
Standard Screw & Machine Co.
Standard Tool & Mfg. Co.
Steel Products Co.
Studebaker Corp.
Timken-Detroit Axle Co.
Turner & Moore Mfg. Co.
William Warren
C. R. Wilson Body Co.
J. C. Wilson Co.
Zenith Carbureter Co.

Many Show Week Meetings in Chicago

CHICAGO, Jan. 26—The Chicago show is more prolific in dealers' meetings and dinners than the New York show was. The following have been scheduled to date. There probably will be others arranged before the week is over.

Chicago Automobile Trade Assn. Luncheon, addressed by E. LeRoy Pelletier, Lexington Hotel, Jan. 26.
Cole Motors Co., Luncheon, Congress Hotel, Jan. 30.
Franklin Auto Co., Luncheon at Congress Hotel, Jan. 30.
Elgin Motor Car (Dealers), Luncheon at Hotel Sherman, Jan. 30.
Elgin Motor Car (Parts Mfrs.) Luncheon at Hotel Sherman, Jan. 30.
Illinois Oldsmobile Co., Luncheon at Congress Hotel, Jan. 30.
Velie Motors Co., Luncheon, Hotel Sherman, Jan. 30.
Dodge Bros., Luncheon, Blackstone Hotel, Jan. 30.
American Truck & Airplane Co., Banquet at Hotel Morrison, Jan. 30.
Nash Distributors, Banquet at Hotel Sherman, Jan. 30.
Reo Motors Co., Luncheon, Congress Hotel, Jan. 31.
Paige-Detroit Motor Car Co., Luncheon, Congress Hotel, Jan. 31.
Harry Newman-Stratton Co., Luncheon at Congress Hotel, Jan. 31.
Hupp Motor Car Co., Luncheon, Blackstone Hotel, Jan. 31.
S. A. E. War Dinner, Morrison Hotel, Feb. 1.

Curtiss Adopts Premium Plan

BUFFALO, Jan. 26—The Curtiss Aeroplane & Motors Corp. has adopted a premium system to increase production. Workmen will receive regular hourly rates, but bonuses will be paid to those who finish tasks in less than the appointed time. The amount of the bonus will be equal to one-half the regular value of the time saved. As an example of how this will work out, suppose a workman, whose hourly rate is 40 cents, finishes a 16-hour job in 10 hours. His regular wage for this time is $4, and the premium is $1.20, or one-half the difference between 16 and 10, or 3 hours. The total payment would amount to $5.20, which represents an hourly rate of 52 cents.

Standard Lifeboat Is Planned

National Association of Boat and Engine Makers Will Endeavor to Design Such Craft

NEW YORK, Jan. 26—The National Assn. of Engine & Boat Manufacturers will urge the adoption of a standardized motor lifeboat by the government as part of the equipment of the emergency fleet, and will endeavor to design a boat that will meet all requirements. This was decided at the annual meeting of the association held Thursday at the Engineering Societies Building. An office will be opened at Washington to enable the association to keep in closer touch with the government.

New members, forming the class of 1920 of the executive committee, were elected unanimously: Henry H. Brautigam, Bridgeport Motor Co., Inc.; Charles A. Criqui, Sterling Engine Co.; Percy C. Jones, S. M. Jones Co.; A. E. Robinson, Regal Gasoline Engine Co., and Henry R. Sutphen, Elco Co.

To Take Census of Lumber Production

WASHINGTON, Jan. 28.—A census of the lumber production of the country during 1917 is to be made by the Forest Service in co-operation with the National Lumber Manufacturers' Assn. Questionnaires have been mailed to 30,000 sawmills throughout the country asking that the amount of each kind of lumber cut be reported promptly.

469,135 Fords in 6 Months

DETROIT, Jan. 29—The output of the Ford Motor Co. for the past 6 months was 469,135 cars or at the rate of 938,270 per year. During the month of October there were 79,675 cars manufactured. The estimated production for this year was placed at 900,000, or about 3,000 per day, but unless war conditions prevent there is little doubt that there will be more than 1,000,000 cars manufactured.

Detroit Men Qualify for Air Service

DETROIT, Jan. 28—A high percentage of applicants from this city for the air service is qualifying. Captain W. R. Wren, president of the United States Aviation Board at Washington, D. C., has just completed several days of investigation here. It was found that while in other cities one out of every ten qualifies for this service, the high-skilled mechanics from this vicinity are qualifying at the rate of nine out of every ten. There are 450 men being recruited from Detroit and vicinity to act as engineers in the non-flying section of the Aviation Corps, and to speed up the program. These men must be either gasoline engine experts or have a collegiate training in the mechanical, electrical or mining courses. Those selected will be given 7 weeks of intensive work at the Massachusetts Institution of Technology.

British Cabriolet Design

(*Continued from page* 270)

A top material for this design is preferably Burbank or similar cloth finish exterior. A shiny or varnish-finish exterior material can be used for a touring top, because this is often only put up when it rains and the creases are not noticed, but on the design illustrated only a flexible cloth finish is permissible. This is better than leather, which while the latter looks rich and adds class to the body, still has the drawback of not wearing well when folded often.

A brief description only is necessary of the folding operation: *A*, the front bow, Fig. 3, is fastened like a touring top front bow to the windshield post and when released folds close to bow *B*. By breaking the joint in the side arms that connect the two together, the pillars *C* and *D* carry the top rail down, the whole being indicated by A-1, B-1, C-1 and D-1. The front pillar *E* is folded in toward the center of the body and the door flappers fold as indicated by arrows.

A folding top when worked out on a drawing generally shows ideally compact when folded, but the results on the actual body should be just as good as this illustration. The bows are far enough back so that the top goods will lay free and not impede the meeting of the framing.

The best material for trimming the interior of this body is a waterproof motor cloth, and the same material is used for the head lining, seat cushions and back. The carpet rug will match the goods. No curtains are used for the doors or quarter windows. The rear window is square cornered and landaulet size.

The appointments are silver finish and are very simple. They consist of one light located in the center of the back bow, concealed toilet cases, one each side forward of the rear seat and of small size, one watch in the front division, telephone for use when the body is closed, regulators on doors and division windows, foot rest and step lights. The extra seats are concealed when not in use.

The trimming design should be as plain as possible. The body will be open a large part of the time, and it is advantageous to have as few places to hold the dust as possible.

The front seat is trimmed in black leather and has pockets on the doors.

A suitable color for this car is green of a pronounced shade for all except the guards and moldings above the belt line and windshield, which should be black with black door handles.

—

Systematic Parts List

(*Continued from page* 274)

a parts list was all wrong, but with a parts list made up as described, which had been so satisfactory in every other respect, it was only a matter of a couple of hours to fill this order.

The form must be printed on a good quality of bond paper, that will stand erasure, and may be furnished in pad form. The size of the form is 8½ by 11, corresponding with the standard letter size. The spacing is such that the form may be placed in a typewriter for entering the information, and when backed with carbon will furnish unlimited copies by being run through the blue-printing machine.

The completed book, which is of the loose-leaf type, may be placed in departments where it is necessary. Changes and additional sheets are forwarded to them through the regular office mail service.

Fig. 6 shows that a parts list arranged in accordance with this system is certainly a systematic arrangement.

—

Won't Place Industry on Losing Basis

(*Continued from page* 289)

army will not for the present at least have any effect on the motor transport section headed by Christian Girl. Mr. Stettinius will work to supervise and co-ordinate the procurement of material, the acquisition by purchase or otherwise of all supplies and munitions required by the army. It will be the duty of the heads of the different bureaus, including, for example, General Chauncey D. Baker, head of the transportation department, which includes the motor transport section, to keep Mr. Stettinius informed of the condition of purchases in the process of manufacture.

The Signal Corps will shortly make a drive for a number of recruits for the non-flying service. The recruiting division, which has been under Major Steever, is now under Major Litchfield. Major Steever's complete organization was transferred with him.

The Ordnance Corps, following considerable criticism, is developing a publicity department, and plans to issue frequent publicity and maintain a departmental organ to show just what it is accomplishing.

The Federal Reserve Board has taken steps toward the limitation of so-called non-essential enterprises by appointing a committee of three bankers, who will pass on capital issues applications which will have to be made by all private companies for the duration of the war. Temporarily this committee will not pass on individual securities issued aggregating less than $500,000 in the case of industrial or public utility corporation.

—

Confer to Keep Roads Open

LANSING, Jan. 28—Highway commissioners of Genesee, Lapeer, St. Clair, Oakland, Washtenaw, Lenawee, Monroe, Millsdale, Wayne and Branch counties held a conference to-day in Detroit for the purpose of discussing methods of cooperating to keep open roads in these counties. Frank F. Rogers, state highway commissioner, representatives of the automobile industry of the state, and a representative of the Michigan war preparedness board, also met with them.

Agricultural Power Unit

(*Continued from page* 281)

able that the inconvenience and time taken in changing such wheels, together with their considerable extra first cost, would very much limit, if not ultimately eliminate, any advantage there might be in this proposition, though it has been frequently suggested.

All axles for road locomotion must be mounted on springs, and this can be readily done in the type of tractor adumbrated.

A road engine, besides having all its weight sprung and the wheels of extra strong design, must in itself be so designed as to properly take care of the vibration set up by such duties.

Land Grips—As has been indicated, the projections attached to the rim of the driving wheels to obtain sufficient hold when plowing, are an important feature, and their design to obtain efficient working is one of no inconsiderable difficulty; the paths traced by three different forms are shown in Fig. 6. The spuds must be of such size and form as to obtain effective hold on the land, and yet not set up too great an increase in rolling resistance by their shape; they should be self-cleaning, and so formed and fitted that, should the differential come into operation and only one wheel revolve, no such side force is set up as may cause the tractor to slip sideways at right angles to its path.

Generally the older forms of tractors, although they gave good service, do not appear to have received sufficient care in their design regarding the points discussed, and they frequently lack the finished appearance of a complete design due to the apparently haphazard arrangement of the constituent parts, *i.e.*, engine, gears, etc., on a rolled section frame.

Progress in this direction has undoubtedly taken place, as is shown by the light type of tractor now coming on the market, in which a separate frame is obviated, and it is obvious that the design was completed at one time by an engineer trained with an eye to the appearance of the whole.

Similar ideas might be incorporated in the horizontal type of engine, with undoubted advantage.

—

Michigan Crown Fender Elects Officers

YPSILANTI, MICH., Jan. 29—The Michigan Crown Fender Co., at a meeting of the board of directors, elected the following officers: Charles H. Bennett, president; A. E. Lewis, vice-president; F. H. Nissly, treasurer; and Fred F. Bennett, secretary and general manager. At the annual meeting the board of directors was increased from 7 to 9 members. The directors electer are Charles H. Bennett, Fred F. Bennett and John H. Patterson, Plymouth; Robert Gaus and A. S. Lyndon, Ann Arbor; H. R. Scovill, A. E. Lewis and John R. Walsh, Ypsilanti. The Michigan Crown Fender Co. was incorporated last March.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Year's Worst Blizzards Demoralize Iron Trade

Iron and steel works of Pennsylvania and all the Middle West are floundering in a snow blockade worse than any in the past two months of such visitations. The whole industry has been so demoralized by these repeated blows that there is to-day little trace of a normal aspect in markets or in plant operation.

Chicago is making painfully slow recovery from a nearly complete shutdown, with little hope of decided improvement apart from milder weather and an early spring. In western Pennsylvania heavy snows on Monday paralyzed traffic and it took more than 24 hours to dig out trains climbing over the Allegheny mountains.

Pennsylvania and Central Western blast furnaces and steel works are operating at from 50 to 75 per cent of capacity and there is little prospect of real relief while winter lasts. Blast furnaces get little coke and what is delivered is so poor that more off iron than standard grades is made. At Connellsville coke ovens 35 per cent car supply is about the average.

Fresh storms and cold have largely defeated the plans for breaking freight blockades, and at steel works piled-up stocks of finished product will impede operations for days and in some cases weeks. The scarcity of cars to move product from the mills is thus fully as serious a factor as scarcity of coal and coke.

The chief gain from the shutdown order thus far has been in the coaling of vessels at Atlantic ports. A very promising start has been made in releasing thousands of tons of steel and munitions awaiting shipment to American and Allied armies.

War shipments make up 75 per cent of the current movement in the heavier finished steel lines. It has been surprising, in fact, on how small a part of the output the country has maintained its ordinary consumption in the past two months.

Pig iron markets have naturally slowed down as the business of delivering has absorbed every energy. That the low phosphorus pig iron supply is short of the demand for the turning out of gun forgings and other war material calling for acid steel is one of the serious features of the situation. Low phosphorus ores from Chile, Spain and Sweden are cut off and the Lake Superior Supply is very limited.

In ferromanganese there has been added to falling domestic production and much smaller imports a recent order stopping for 60 days the shipment of manganese ore to seaport over the Central Railway of Brazil, due to lack of fuel. However, after three years of alarms ferromanganese users are not easily thrown into a panic.

How large has been the volume of Government fabricated steel work, particularly for the fabricated ship program, is indicated by the 205,000 tons of bookings by bridge and structural shops in December, 14 per cent above rated capacity. Over one-third of last year's business was done in the last quarter. Two years ago a spurt due to plant extensions gave a total in December, 1915, of 208,500 tons, but general building was not heavily checked then as now.

About 45,000 tons of relatively light steel work is needed for 1500 buildings for the Signal Corps. For the Quartermaster's Department for buildings in the United States 3500 tons has been closed.

Upward of 500 tons of large machine bolts have sold at $15 per ton below the allowed level. Where demand upon certain manufacturing departments slackens, the old law of competition in price seems still to be working.

There is keen interest in the making up of a new Iron and Steel Institute committee on prices and practices in the old material trade. More drastic control is predicted, with the elimination of some of the rulings the trade has been disposed to make for itself in certain districts.—*Iron Age.*

A New Service

¶Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

Coal Short in Detroit

DETROIT, Jan. 30—The coal situation continues to be serious and is now compelling big industrial plants in this vicinity to close. The C. R. Wilson Body Co. has been shut down for 2 days and only by borrowing odd amounts from other plants has it been able to reopen this morning. It is probable that the Morgan & Wright plant, employing 4200 will have to close to-morrow morning.

Detroit has been receiving an average of less than 350 cars a day whereas the average consumption is 700 cars a day. The result of the heatless Monday is not noticeable from an industrial standpoint although private consumers are directly benefitted by the saving.

Storms Counteract Effect of Fuel-Saving Holidays

The coal-conserving holidays and the following heatless Monday have had less effect in relieving the scarcity of coal than was probably anticipated when they were ordered. While the railroad situation shows considerable improvement in some localities, the "Weather Man" has apparently shown great sympathy for the Kaiser. Storm after storm has swept the country until in many regions the snow is now 2 ft. or more deep on the level, with huge drifts in many places. Thus far the winter is generally conceded to be the worst in many years. Of course, the heavy snowfall has its redeeming features, as in many localities, particularly in the West and Southwest, it is an indication of abundant crops the following year. But crops do not keep people warm in the winter. From all over the country come reports of the small and inadequate supplies of fuel on hand being doled out in half tons and ton lots to consumers who never quibble over price or quality, their only concern being to secure the coal. In many instances, all over the East in particular, long lines of people are besieging coal offices and yards, carrying away 100-lb. sacks of coal in all types and descriptions of vehicles from a barrel-stave toboggan to a high-powered automobile. Strange as it may seem, this clamor for coal is probably as insistent in Philadelphia, within 150 miles of the coal fields, as it is in any other city. The fact that coal cannot be supplied has furnished ammunition for all manner of criticism and complaints against everyone in any way whatsoever connected with the coal industry, from the meanest trapper-boy in the mines to the President of the United States. In more than one instance, and in more than one city, the police have been called upon to preserve peace and order in the offices of coal retailers. Lately there has come forward a demand from comparatively well-to-do citizens who had laid in their ordinary winter requirements of coal, but owing to the severe weather have consumed this supply months earlier than is normally the case. It now seems difficult for this class of people to understand that they cannot secure all of any commodity that they have the inclination to buy and the money to pay for.

One bright spot in the situation that has developed in the recent past is that bunkering of steamships at tidewater is now approximately normal. There are not at present, thanks to the partial cleaning up of congestion in tidewater rail yards, the long delays in bunkering of ocean-going freight and passenger vessels that prevailed two weeks ago.—*Coal Age.*

Mexico Rated Second in Oil

61,000,000 Barrels of Crude Oil Produced in 1917—35% Gain Over Previous Year

MEXICO CITY, Jan. 24—About 61,000,000 bbl. of crude oil were produced in Mexico last year, an increase of 21,000,000 gal. over 1916. Mexico can now be rated as the second largest oil producing country in the world, replacing Russia, whose production has decreased because of the unsettled conditions during the past year.

Records of oil production in Mexico are available from 1904, since which time there has been a total output of 226,660,979 barrels. The greatest increase was in 1911, when 14,051,643 barrels were produced as compared with 3,332,807 in 1910. This was due largely to the bringing in of the Mexican Petroleum Co.'s famous No. 7 well, which has been flowing since September, 1910 at the rate of 20,000 bbl. a day without apparent diminution of quantity or change in quality.

The number of barrels of crude oil produced in Mexico since the beginning of the industry there, follows:

Mexico's Crude Production

Year	Production	Year	Production
1917	61,000,000	1909	2,488,742
1916	39,801,110	1908	3,481,610
1915	35,500,000	1907	1,717,690
1914	21,188,427	1906	1,097,264
1913	25,902,439	1905	320,379
1912	16,558,215	1904	220,653
1911	14,051,643		
1910	3,332,807	Total	226,660,979

In 1917, Mexico exported between 25,000,000 and 30,000,000 bbl. to the United States, against 20,000,000 in 1916. Shipments to other countries also increased last year, especially the republics in west South America, formerly supplied by the United States.

—

Tide Water Oil Unifies Organization

NEW YORK, Jan. 26—To simplify and unify its organization, the Tide Water Oil Co. has established a Veedol department to distribute its products. The Platt & Washburn Refining Co., which previously carried on the business of selling these products, will be dissolved. This concern has been owned by the Tide Water company for 29 years, although conducted as a separate organization. There will be no change in the policy or personnel of the management, the Veedol department of the Tide Water Oil Co. simply taking over all orders, contracts and other obligations, as well as accounts, notes, etc., due the Platt & Washburn Refining Co.

A principal office has been opened at 11 Broadway, New York, with H. J. Guthrie as manager and Byron D. Benson and C. W. B. Fisher assistant managers. The metropolitan district and Atlantic division offices will be located in the same building, with F. B. Vanderhof in charge of the former and H. S. C. Bacon of the latter. The Boston office of the Atlantic division will be located at 161 Massachusetts Avenue and the Philadelphia office at Delaware Avenue and Green Street. J. M. Stockfish will be manager of the Mid-Continent division, with offices in the Insurance Exchange Building, Chicago. The Pacific division office will be in the Monadnock Building, San Francisco, with Leonard Freer as manager.

—

Case Conducts Tractor School

RACINE, Jan. 26—About 20 tractor schools are being conducted in different parts of the country this winter by the J. I. Case T. M. Co., Inc., of this city. The instruction offered is entirely free and any farmer is welcome, whether he owns a Case tractor or not. Part of the time is given over to lectures and regular class room work and the rest is devoted to practical work. Students are given tractors to dismantle and study; they are allowed to reassemble and put them back in running order, and all this work is done under the guidance of experts from the factory. The students are taught to operate the tractors, to care for them under all weather conditions and to hitch up to the various implements that they will have to haul. Experts from the magneto and carbureter factories are also in attendance and explain and demonstrate these devices. The plan has met with favor among the farmers and all the schools are well attended.

—

Aviation Camp at Selma, Ala.

WASHINGTON, D. C., Jan. 25—The War Department is considering the establishment of a site at Selma, Ala., for an aviation training camp.

Gas Production Cost 14.9 Cents

Figure Based on 55 Refinery Reports—Does Not Include Sales or Freight Charges

WASHINGTON, D. C., Jan. 29—Basing its investigations on figures that come from fifty-five refineries operating in all parts of the United States, the Federal Trade Commission has ascertained that the average cost of producing a gallon of gasoline is 14.9 cents. This is the bare refinery cost, including the cost of the crude oil, operating, depreciation and overhead, but does not include the cost of selling and transporting to the market, nor are any figures included for interest on the investment or profits. The figures are for gasoline produced in August, 1917, and are the result of distributing the actual total refinery costs to the various refined products on the basis of the values of the various products. The cost of the crude oil is the market price paid by the refinery, including transportation cost from the well to the refinery. The prices for which gasoline has been selling are for Sept. 1.

The states embraced in the investigation are: New Jersey and Eastern: New Jersey, Pennsylvania, Delaware, Maryland, Ohio, District of Columbia, Virginia, West Virginia, North Carolina and South Carolina. Indiana and North Mississippi Valley: Indiana, Illinois, Michigan, Wisconsin, North Dakota, South Dakota, Iowa, Missouri and Kansas. Gulf Coast: Texas, Louisiana and Arkansas.

—

PHILADELPHIA, Jan. 26—A petition to have the Rush Motor Truck Co. adjudged an involuntary bankrupt has been filed in the United States District Court.

REFINING COST PER GALLON OF GASOLINE

1. New Jersey and Eastern Territory

	Low, Cents	High, Cents	Representative, Cents	New York Price, Cents
Cost of crude oil	12.0784	13.9575	12.7584	
Costs of refining	2.0271	3.9570	4.8836	
Total	14.1055	17.9145	17.6420	26

2. Indiana and North Mississippi Valley

				Chicago Price, Cents
Costs of crude oil	9.8212	12.8827	11.5120	
Cost of refining	1.3620	3.8621	2.1630	
Total	11.1840	16.7448	13.6750	21

3. Oklahoma

				Oklahoma City Price, Cents
Cost of crude oil	9.8804	15.2620	11.1860	
Cost of refining	1.5196	2.3740	3.4856	
Total	11.4000	17.6360	14.6706	24

4. Gulf Coast

				Fort Worth Price, Cents
Cost of crude oil	11.5670	14.5774	13.6608

Many Sales Made at 1918 Shows

Results in Each Case Exceed Anticipation of Dealers—Record Crowds at Cleveland, Montreal and Milwaukee

MILWAUKEE, Jan. 29—Results of the Tenth Annual Show, held at the Auditorium from Jan. 16-26, were much more favorable than had been anticipated, in these abnormal times. The show was held in two sections, the first 7 days being devoted to passenger cars and accessories, and the last 3 days to commercial cars, tractors, trailers, road locomotives and commercial vehicle accessories. The total attendance for 10 days was 80,000. It is estimated that 50,000 saw the passenger car exhibits and 30,000 the truck show. Although the Milwaukee Dealers' Assn., under whose auspices the show was held, did not expect the attendance figures to come up to last year's, there was a 15 per cent increase.

Among the special features of the show was a Class B military truck, loaned to the association by the Quartermaster's department; a Nash Quad ammunition truck used for instructional purposes; a standardized Class B engine; and a Locomobile coupe equipped with a snow plow which enables the car to travel in the worst blizzard.

The truck displays included 139 vehicles made by 44 manufacturers.

—

Montreal Show a Success

MONTREAL, Jan. 26—The Fifth Montreal Automobile Show, which closed last Saturday, stands out as the most successful ever held here, both from the standpoint of the Montreal Trade Assn., under whose auspices it was held, and the dealers. The attendance was greater than that of 1917, and the sales came up to expectations. There were 62 exhibitors, showing 100 models of passenger cars and 12 trucks. In addition there were 245 accessory exhibits.

Montreal, as an automobile center, differs from most cities, because of the long winter season, but motor cars are being more generally used this winter than ever before. An idea of the increase may be gained from the fact that fiye times as many radiators and robes have been sold as during last year.

—

22 Cars Sold at Wilmington Show

WILMINGTON, DEL., Jan. 28—With an attendance of 60,000 and 22 car sales, besides a lot of good prospects, the 21 motor car dealers and eight accessory houses exhibiting at the fourth annual Wilmington Automobile Show, which closed at the Hotel Du Pont on Saturday night, believe the $1,200 which they invested in the show was well spent. Because this show is held in the spacious lobby and main dining room of the hotel, no admission is charged and the expense has to be borne by the exhibitors.

The attendants this year were more bent on business than ever before and most of the purchases were made for business reasons. While no farm tractors or trucks were permitted at the show, some tractor men were there, and they report good prospects all over the state this year.

The field in Delaware was never in better shape than it is to-day. Everybody is prosperous, while in Wilmington many unskilled laborers are making $50 a week and some skilled mechanics make more than $100. Agricultural Delaware realizes its opportunity to help take care of this year's demand for produce, and there is every reason to believe that nearly every farmer will employ any device that will save labor and help him in his business. In addition to the increased demand made on him, he finds labor very scarce, being attracted to the cities by high wages, and this is a further reason why the labor-saving motor devices are going to help him win his battle for his country and himself.

Wilmington is said to be the richest city per capita in the country, and while there are a few very rich men, the bulk of the population is well-to-do, and there are very few of the poor class. Accordingly the outlook for the motor trade in city and state this year is splendid.

—

No Change Made in Boston Show Dates

BOSTON, Jan. 26—Boston will hold its show on March 2 and the following week. The matter was thoroughly considered and it was found by the Board of Directors that a change to a later date would involve many cancellations of contracts and would be generally harmful. A number of the dealers wanted it to be held as originally planned so they could take advantage of the early Spring. The only idea of planning to change the date was due to the Monday holiday and the thought that the fuel administrator would hamper the exhibition by closing it at night. That is not thought possible now. There are 90 makers who have taken space and there will be about 500 cars and trucks in the show. This will be the only big show where trucks will have a good chance to exhibit as well as cars. Many accessory people are on the list of exhibitors also.

—

Optimism Feature at Baltimore Show

BALTIMORE, Jan. 26—The Twelfth Annual Show came to a close to-night, and left the dealers here optimistic about the coming year and certain that they will be able to sell every car they can bring into their territory. Although the attendance of the show was less than last year's, the number of sales was greater. In addition, most of these are for immediate delivery and not for spring, as is usually the case. The smaller attendance is accounted for by the fact that blizzards made the roads impassable and kept farmers and buyers from west Maryland and the eastern shore away.

There were 43 distributers, showing 183 models of passenger cars, at the show. Closed cars and convertible bodies predominated.

—

York Show Postponed

YORK, PA., Jan. 29.—Owing to the coal shortage, the annual York Show, which was to have opened Jan. 26 in the Tabernacle, South Queen Street, was called off.

—

Record Crowd at Cleveland Show

CLEVELAND, Jan. 28—There was a record attendance at the Cleveland show, which closed yesterday, and dealers report the greatest number of sales ever made during show week. One result was to efface the pet theory of a few pessimists that the public is not interested in cars this year. Another was to prepare the dealers for what will probably be the greatest spring rush they have ever known.

The show was arranged as a springtime scene, and almost every exhibitor had rugs, art lamps and plants in his display to harmonize with the general effect. Every day was advertised as a special event and brought special visitors to the Coliseum. Saturday was opening day; Monday, dealers' day; Tuesday, Automobile Club day; Wednesday, aeronautic day; Thursday, tractor day; Friday, S. A. E. day; Saturday, good roads day, and Sunday, closing day.

One of the special exhibits was a dental ambulance loaned by the Government. Cars were driven overland in most cases, direct from the factories. The road from Detroit to Cleveland is used by truck trains, and the excellent condition of the route made this possible.

—

Ford Branch Managers Convene

DETROIT, Jan. 28—About forty branch managers of the Ford Motor Co. held a 4-days' convention at the Highland plant to discuss general business. Those present included J. S. Keown, Albany, N. Y.; G. B. Tyler, Buffalo; R. S. Abbott, Atlanta; H. K. Munroe, New Orleans; J. J. Harrington, Cambridge, Mass.; Gaston Plaintiff, Long Island; F. J. DeTamble, Charlotte, N. C.; G. I. Banks, Jacksonville, Fla.; Dayton Keith, Chicago; A. W. L. Gilpin, Milwaukee; G. C. Nichols, Cincinnati; F. E. McClure, Cleveland; H. M. Buckley, Columbus, O.; P. J. Garnett, Spokane, Wash.; A. J. Langford, Dallas, Tex.; N. J. Schumucker, Scranton, Pa.; Chas. Hendy, Jr., Denver; J. A. Handin, Salt Lake City, Utah; P. F. Minnock, Des Moines, Ia.; C. L. Gould, Omaha, Neb.; W. P. Winders, Fargo, N. D.; C. C. Hildebrand, Minneapolis; O. L. Arnold, Houston, Tex.; Wm. McDonald, San Antonio, Tex.; A. H. Smith, Indianapolis; H. M. Dunbar, Pittsburgh; R. P. Rice, Kansas City; W. C. Anderson, St. Louis; B. L. Graves, Los Angeles; J. B. Lund, San Francisco; C. S. Williams,

Louisville; J. J. Right, Memphis; J. A. Deignan, Oklahoma City; W. S. McNamara, Wichita; L. C. Block, Philadelphia; R. P. Jones, Washington; A. W. Jones, Portland, Ore.; F. L. Rockelman, Seattle.

—

New United Trucks Seen at Chicago

GRAND RAPIDS, Jan. 28—The new United worm-drive motor truck models, manufactured by the United Motors Co., will be on exhibition at 1231 Wabash Avenue, Chicago, during the time of the Automobile Show. The new series includes models of 1-, 2-, 3½ and 5-ton capacities. Prices, including bumper, radiator guard, hubodometer and painting, follow:

1-ton	$1,850
2-ton	2,550
3½-ton	3,450
5-ton	4,500

—

5,000,000 Bushels of Castor Beans from Texas

AUSTIN, TEX., Jan. 29—In response to the request from the Government for an increase in the production of castor beans, which are to be made into a lubricant for the Liberty engine, more than 100,000 acres are to be devoted to this product. The average is 50 bushels to the acre, and a crop of 5,000,000 bushels in Texas alone, is practically assurred.

—

Close Missouri Garages from 7 A. M. to 7 P. M.

ST. LOUIS, Jan. 28—The first fuel order affecting local trade was issued last Thursday, when it was expressly ordered that all motor car and accessory salesrooms must be closed from 7 P. M. until 7 A. M. The order covers garages and filling stations. In case of garages with established all-night trade, permits can be obtained from Robert E. Lee, Secretary of the automobile trade associations here, who is appointed deputy fuel commissioner to enforce the order.

—

Pacific Tire Seattle Distributer

NEW YORK, Jan. 24—In an item which appeared in a recent issue it was inadvertently stated that the Pacific Tire & Rubber Co. is distributer for the Carlisle Cord Tire Co. in Los Angeles. This should have been Seattle, Wash. The Geo. W. Eno Rubber Co. is the Carlisle representative in Los Angeles.

—

Daily Truck Trains Scheduled

DETROIT, Jan. 30—Government trains of Packard trucks are now scheduled to leave the factory at the rate of one train a day or a complete convoy each week. There are thirty trucks to a train and six trains or one hundred and eighty trucks make up a convoy. It requires eighty men to handle the train and these are in charge of a lieutenant. The convoy is under the direction of a convoy officer who is located in Detroit. Many trucks going forward in these convoys are destined for the expeditionary forces.

States Cooperate on Truck Routes

Highway Departments Work During Storm to Clear Roads —Day and Night Shifts

WASHINGTON, Jan. 29—"Motor truck convoy makes trip over highway," stated a recent news item, and most readers gave it a single glance, never thinking of the importance of the statement.

In that convoy were 27 trucks and several passenger cars. It was the first army truck convoy to attempt to negotiate the highways of the United States. It successfully traveled over 900 miles of road, most of which were covered with snow and in a climate where the thermometer registered below zero.

Now comes the news that five such convoys have left Detroit, each one day apart, and are successfully coming East to the seaport. Soon, no doubt, we will learn that hundreds of convoys and thousands of trucks are on their way overland, driven by their own power, carrying vast tonnage of supplies.

The work of carrying on the winter highways, of keeping them free from snow to allow safe and speedy travel of the passenger cars and trucks was very interesting. New schemes, new methods, new appliances, all had to be arranged and secured.

W. D. Uhler, chief engineer of the Pennsylvania State Highway System, worked out the plan by which Pennsylvania so efficiently kept open its highways for the first truck company. The department was constantly alert.

It arranged with the weather bureau at Pittsburgh so that it was and is constantly informed as to weather conditions and approaching storms.

As soon as word was received of the approach of a storm the maintenance division sent immediate notices to the various district engineers through whose districts the state highway passed, and they in turn arranged to have their men and equipment ready so that no time was lost in fighting the storm.

They worked on the basis that the most efficient and economical work could be done by fighting the snow rather than waiting until after the snow had fallen. As soon as the snow reached a depth of 2 in., and indications pointed to a continuance of the storm, snow plows consisting of motor trucks fitted with wooden boards arranged on rollers to act as plows, also motive trucks pulling standard road machines and road machines pulled by horses were placed at work. In some cases road drags were used and found advantageous.

In the case of heavy drifts it was necessary to send drags drawn by horses through to break a track to enable the motor plows to work, while in extremely heavy drifts work by hand and shovel was necessary. In all cases where it was possible machinery was used, and the number of plows, road machines, drags, labor, etc., was entirely dependent upon the extent of the storms. Where necessary day and night shifts were used.

The Pennsylvania department, which undoubtedly has provided the War Department with the most efficient highway service during these extremely winter months, is now working day and night keeping open every highway for the movement of United States army trucks, and is operating nine motor trucks equipped with snow plows, fifty road machines and numerous rapid trucks. Other state highways may well observe the method and work of the Pennsylvania department and adopt some of its plans, for it has up to this time been the one state that has cooperated in every way with the Government.

Sooner or later the use of all highways, both for war and commercial purposes, is certain to come. State highway officials with vision able to peer into the future will, of course, realize the opportunity that lies in immediate development and constant maintenance of the highways under their jurisdiction.

—

Jellinek-Mercedes Dead

PARIS, Jan. 23—A news dispatch announces the death at Geneva, Switzerland, of Emile Jellinek-Mercedes, the man who is responsible for the name Mercedes in the automobile, aircraft and motor boat industries. Jellinek was a wealthy Austrian who from 1880 to the outbreak of the war resided at Nice in Southern France and acted as Austrian Consul there. About 1900 Jellinek secured financial control of the Daimler Motor Co. of Caunstatt, Germany, and he claimed credit for having inspired Mayback, chief engineer of the Daimler works, with the idea of building a light and powerful chassis. This chassis, of 40 hp. weighed less than 2200 lb., whereas the 1899 Daimler model of 28 hp. weighed about 4000 lb. The car was named the Mercedes for Jellinek's daughter.

—

Paul A. Smith Dies

ST. LOUIS, Jan. 28—Paul A. Smith, general manager of the Overland Automobile Co., died Wednesday night of uremic poisoning. Smith was born in Ingersoll, Ontario, in May, 1884, and first attracted attention as general salesmanager for the Detroit Steel Products Co. He later joined the executive staff of the Willys-Overland Co., and last July came here as manager of the local company. He became ill in December and a trip to Hot Springs and an operation failed to help him. During his stay here he was active in business organizations. The funeral was held Saturday at Windsor, Ont.

—

Welch Leaves King

DETROIT, Jan. 29—C. J. Welch has resigned as vice-president and sales manager of the King Motor Sales Co.

Making Pennsylvania's Snowbound Roads Passable for Trucks

The Pennsylvania State Highway Department is using trucks equipped with especially designed and constructed road scrapers to keep the snowbound roads in condition for truck-train travel. Above is shown the complete truck and the method of attaching and operating the scraper

This shows the snow removal between Darlington and Beaver Falls to provide for motor truck transportation throughout the state

An excellent example of a finished snow roadway showing the width to which the snow is cleared and the smooth, hard surface

After a preliminary plow the road is widened by running the truck close to the ditches providing a smooth, hard roadway

This will give some idea of the way in which snow is piled at the sides and of the appearance and condition of the finished roadway

Men of the Industry

Changes in Personnel and Position

C. B. Hayes President of Jackson Munitions

JACKSON, MICH., Jan. 28—Clarence B. Hayes, of the Hayes Wheel Co., has been elected president of the Jackson Munitions Co. A strong directorate has been brought together, including O. W. Mott, C. C. Bloomfield, Dean Kimball, B. M. Delameter, M. S. Potter, Edward Frensdorf, Watson R. Smith, John W. Miner and A. G. McBurney. The company is capitalized for $500,000.

—

T. P. Chase has resigned as chief engineer of the King Motor Car Co., Detroit. He leaves Feb. 1.

—

W. E. Blaine has resigned as truck engineer for the Packard Motor Car Co., Detroit. He has been appointed a captain in the Officers' Reserve Corps of the Ordnance Department and will be stationed at Washington.

—

E. B. Pierce has been appointed consulting engineer in charge of the recently completed commercial laboratory of the Republic Motor Truck Co., Alma, Mich.

—

Charles A. Ackerman, for the last three years used car manager for the New York branch of the Studebaker Corp. of America, has been appointed sales manager for the Franklin Motor Car Co. of New York, Franklin distributer. He will have supervision over both new and used car sales departments.

—

Thomas B. Davies, formerly with the Carnegie and Pittsburgh Steel companies, has been appointed district sales representative of the Syracuse, N. Y. branch of the Central Steel Co., Massillon, Ohio.

—

R. E. Benner has been made factory manager of the H. H. Franklin Co., Syracuse, N. Y. Benner was at one time with the Maxwell company as a car designer and afterward with the Buick company.

—

Ollie E. Haupt, of the Ollie E. Haupt Motor Co., St. Louis, has enlisted as an officer in the Aviation Corps, San Antonio. Paul Schoenig, of the Ford assembly plant in St. Louis, has been made manager of the company.

—

Wesley A. Stanger has resigned as president of the Mitchell Automobile Corp., St. Louis. He formerly was president of the Ben Hur Co. of Missouri.

St. Alexis Steiner, formerly an officer of the Velie Automobile Co. of St. Louis, has been promoted from first lieutenant to captain in the United States Army, and made instructor in field fortifications for the Eighty-ninth Division at Camp Funston.

—

W. F. Schmidt has been made general manager of the Packard-Missouri Motor Car Co., St. Louis.

—

Frank A. Flint, sales manager for the Hudson-Phillips Motor Car Co., St. Louis, has been made assistant sales manager of the central zone for the Chevrolet Motor Co., with headquarters at Flint, Mich. He will join B. J. MacMullen, formerly manager of the Hudson-Phillips Co.

—

W. H. Knowles, formerly chief engineer of the Saxon Motor Car Co., has been appointed superintendent of the Philadelphia plant of Hale & Kilburn.

—

J. M. Crawford, formerly assistant chief engineer of the Chalmers Motor Car Co., is now chief engineer of the Allen Motor Co., Fostoria, Ohio.

—

E. W. Martin, for several years superintendent of construction at the Ford Assembly plant, St. Louis, has become manager of the Hallman-Whitten Mfg. Co., 4440 Olive Street, St. Louis.

—

J. F. Dugan has been made production manager of the Stanley Motor Carriage Co., Newton, Mass. He was formerly works superintendent of the Buick Motor Co. and production manager of the Chevrolet Motor Co.

—

Frank Eldridge, formerly manager of the Wallace C. Hood Service Bureau, is now with the King Auto Sales Co., 998 Woodward Avenue.

—

E. E. Main, until recently with the Rajah Auto Supply Co., Bloomfield, N. J., has been appointed chief engineer of the Eclipse Mfg. Co., Indianapolis.

—

Deeds Is Promoted

WASHINGTON, D. C., Jan. 28—Col. E. A. Deeds, in charge of the equipment division of the Signal Corps, has been promoted to be assistant to the Chief Signal Officer and now has his office headquarters with the Chief Signal Officer. Col. R. L. Montgomery, formerly the assistant to Col. Deeds, has been promoted to become the head of the equipment division and is assisted by W. C. Potter, banker, of New York city, a civilian appointed as assistant to Col. Deeds.

—

Bane on Aircraft Board

WASHINGTON, D. C., Jan. 28—Lieut. Col. Thurman H. Bane, Signal Corps, is appointed a member of the Joint Army and Navy Technical Aircraft Board, vice Major Harold S. Martin, Signal Corps.

New Companies Formed

Latest additions to ranks of Automotive Industries

Minerva Co. to Build Truck and Tractor Engines

CLEVELAND, Jan. 21—In order to take advantage of the demand for heavy duty tractor and truck engines, the Minerva Engine Co. has been organized by Cleveland interests, and in the near future will start production. The engine to be manufactured by the concern was designed by C. F. Goby and R. K. Johnson. It is on conventional lines, but built for operating continuously under a nearly full load. The company has ample shop facilities for immediate needs, but is considering various factory locations. At present only one 4-cylinder model will be produced of 4 by 5½ in. cylinder dimensions, the cylinders being of the L-head type. All parts are thoroughly protected from dust and dirt, yet efforts have been made to secure the greatest possible accessibility.

—

ANN ARBOR, MICH., Jan. 22.—The Forge Products Corp. has incorporated with a capitalization of $350,000 to manufacture high speed steel forgings for tool work and automobile parts. The directors so far selected are C. F. Simmons and C. W. Goodside, of New York City, and J. C. Cummings and Henry Winenan of Detroit, who have elected L. J. Hoover president.

Work on the first building, which will be 50 x 100 ft., will be started at once. All the necessary machinery has been purchased, and will be ready for installation upon completion of the first building. The company expects to start production in about 90 days.

—

EAU CLAIRE, WIS., Jan. 26—The United States Gear Shift Co. has been formed here with $1,500,000 capital to manufacture a hydraulic gear shift which is the invention of L. A. Laursen. It is proposed to erect a factory here and to commence production within six weeks. The device is intended for application to existing cars without extensive alterations.

—

CHICAGO, Jan. 23—To assist the railroads in short-haul business and speed up freight deliveries originating in Chicago and towns immediately north and south, the Chicago, Waukegan & Hammond Transportation Co. has been incorporated. William L. O'Connell, former chairman of the Illinois State Public Utilities Commission, has been elected president. Application was made to this commission for a certificate of convenience and necessity, which probably will be granted this week.

Digitized by Google

Mason Motor Becomes Chevrolet Component

FLINT, MICH., Jan. 28—The Mason Motor Co. has ceased to exist. It is now the motor and axle department of the Chevrolet Motor Co. The stock of the Mason company has been held in the treasury of the Chevrolet company for 2 years. Starting with Jan. 1, 1918, the title Mason Motor Co. officially ceased to exist, the company now being a direct component of the Chevrolet concern.

—

More Space for Townsend

JANESVILLE, WIS., Jan. 28—The Townsend Mfg. Co., Janesville, Wis., maker of gas engines, tractors and power machinery, has awarded contracts for the erection of two shop additions made necessary by several large orders received from its distributers in the United States, Canada and Europe.

—

Wolverine Tractor Moving to Saginaw

DETROIT, Jan. 23—The Wolverine Tractor Co. will move to Saginaw, where it will occupy the Piano Action plant. Saginaw will raise $250,000 for stock in the company.

—

Cassidy Co. to Sell Twombly Pump

NEW YORK, Jan. 28—The Edward A. Cassidy Co. will be the sales representative for the Auto Pedal Pump Co., New York, and sell the Twombly Tire-Foot-Pump.

—

Enterprise Brass Foundation Finished

MUSKEGON, MICH., Jan. 29—The foundation of the Enterprise Brass Works building is complete, and a 2-story building 40 x 60 will be erected on it immediately.

—

Larger Quarters for Niehoff & Co.

CHICAGO, Jan. 28—Paul G. Niehoff & Co., Inc., has moved to larger quarters at 232 East Ohio Street and has increased the facilities of its metallurgical laboratories.

—

Start Wire Wheel Patent Suits

NEW YORK, Jan. 26—The Wire Wheel Corp. of America has started suit charging infringements of five of its wire wheel patents, Nos. 1,047,742-Pugh, 760,684-Cowles, 1,030,428-Cowles, 1,076,558-Duffy and 1,125,498-Duffy. The suit has been entered against C. T. Silver, Metropolitan distributer of Kissel and Apperson cars, on the grounds that cars exhibited by Silver are equipped with Frayer type wheels made by the Phelps Mfg. Co., Columbus, Ohio.

—

Changes in Capital

CLEVELAND, Jan. 29—The Ohio Rubber Co. has increased its capital stock from $400,000 to $500,000.

WICHITA, Jan. 28—The Jones Motor Car Co. has increased its capital from $500,000 to $1,500,000.

PITTSBURGH, Jan. 28—The Denas Armor-Cased Tire Saving Co. has increased its capital from $200,000 to $1,000,000.

—

PEORIA, Jan. 28—Due to increased business and many war contracts, the Peoria Tractor Co. has increased its capital stock from $60,000 to $1,500,000. The company is composed of F. R. Dennis of Chicago, president; George McFarland of Peoria, secretary, and E. M. Smith of Peoria, director and manager. It is planned to retain the main plant at East Peoria, but branch plants will be opened from time to time at points in other states which offer the most satisfactory inducements.

—

NEW HOLSTEIN, WIS., Jan. 26—The John Lauson Mfg. Co., New Holstein, Wis., which recently increased its capital stock from $500,000 to $1,000,000, is marketing $250,000 of the new issue, which consists of preferred shares. The purpose of the increase in capital is to enable the company to double its production of tractors and still maintain its regular output of about 4000 stationary and portable gas and kerosene engines annually. The company is filling a Government contract for tractors, requiring from 150 to 200 machines, and an order for 50 tractors from the Northwell Co., Omaha.

—

DETROIT, Jan. 29—The Acme Motor Truck Co. has increased its common stock to a total of $750,000 and its preferred to $250,000. There is $280,000 outstanding common stock at present, including the $80,000 added to the stock total through a dividend declaration made by the board of directors. This represents a 40 per cent dividend.

—

KALAMAZOO, MICH., Jan. 29—The Lane Motor Truck Co. will increase its capital stock from $25,000 to $225,000. The increase will be used for speeding up production to 10 trucks a week. In the spring, an addition, 60 x 100, will be erected as a painting department. Of the proposed stock issue, $50,000 will be set aside and $150,000 will be sold.

—

LA CROSSE, WIS., Jan. 29—The La Crosse Tractor Co. has increased its capital stock to $2,500,000 to provide for the rapid growth of the company.

—

SIOUX CITY, IOWA, Jan. 25—Sioux City Tire Mfg. Co. has increased its capital stock from $200,000 to $1,000,000 and is planning an addition to its plant.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

Muskegon Engine Co. Starts Truck Production

MUSKEGON, Jan. 29—The Muskegon Engine Co. has started production on its 2-ton truck. One truck has been completed and as soon as machinery is installed the plant will be speeded to full capacity. This truck is driven by a Continental type C-4 engine, has a multiple disk clutch, Torbensen internal gear axle, M & S differential, Pierce governor, Stewart carbureter, Lavine steering gear, and Bower bearings. At present about 20 employes are at work.

—

Standard Fenders for Chicago Trucks

CHICAGO, Jan. 25—Beginning Feb. 1, all trucks here must be equipped with fenders of a specified standard. The ordnance requiring this was passed recently by the City Council. The Motor Truck Owners' Assn. is contending that the law is unconstitutional, and a test case is scheduled for the Master of Chanceries Court.

—

No Chain Truck to Start Production

ST. LOUIS, Jan. 28—The No-Chain Truck Unit Co., 3302 Lawton Avenue, will begin the manufacture of the Truxton truck on a large scale at once. The company has been manufacturing the No-Chain truck unit only.

—

Hayes-Ionia to Build

GRAND RAPIDS, Jan. 28—An addition of 230 x 110 ft., three stories in height, will be added to the plant of the Hayes-Ionia Body Co.

—

New Loyal Truck Models

LANCASTER, OHIO, Jan. 28—The Loyal Motor Truck Co. is preparing to manufacture a ½-ton truck and a 1500-lb. "Loyal Special," featuring oversize and greater carrying capacity.

—

Detroit Shell Buys Springfield Body Plant

DETROIT, Jan. 28—The Detroit Shell Co. has purchased the plant of the Springfield Body Co. from B. F. Everett, the company's trustee. Buildings, machinery and land brought $500,000. The Detroit Shell Co. contemplates important additions to the plant.

—

20 Per Cent Increase in Paige Orders

DETROIT, Jan. 28—The Paige-Detroit Motor Car Co. has 20 per cent more cars booked on order at present than it had last year. In spite of the shipping conditions the company is only 49 cars behind in delivery.

—

Wisconsin Motor Adds to Capital and Plant

MILWAUKEE, Jan. 30—The Wisconsin Motor Mfg. Co. has increased its capital stock to $1,000,000. An addition, quadrupling the capacity of the plant, has been completed and will be used mainly for assembling motors. It will have a floor space of 43,500 sq. ft. The old assembling plant has been converted into a machine shop.

Digitized by Google

Price of Airplane Spruce Cut

WASHINGTON, Jan. 25—The market price of aircraft spruce has been cut from $200 per thousand feet to $105 through the work of the Aircraft Production Board. Figured on the basis of last year's output of 30,000,000 feet, which is far less than the amount which will be consumed in 1918, this represents a saving to the government of $2,850,000. The board has also arranged for a free exchange of airplane patents, and the United States will be able to use foreign designs without paying royalty. On each preliminary training machine a saving of from $750 to $900 has been effected through this action.

Louisville Advantageous for Industry

LOUISVILLE, KY., Jan. 28—The Louisville Industrial Foundation has sent out announcements to manufacturers of war materials pointing out the industrial advantages of the city. The Louisville central station, according to the announcement, has more than 10,000 kilowatts surplus electric power for industrial purposes, and a plentiful supply of coal which is assured the power station, due to the fact that the coal mine from which it draws its supply is less than a day's run, promises the continuity of electric power. The movement of residents to suburban districts has made available in Louisville several thousand buildings suited to the living requirements of labor.

Truck Lines Classed as Common Carriers

LANSING, MICH., Jan. 28—Cassius I. Glasgow, chairman of the railroad commission here, has given out the statement that truck lines advertising transportation from city to city are to be classed as common carriers. Therefore, they must give bills of lading to shippers, supply reports to the railroad commission and be responsible to the shipper. The Attorney-General has held this opinion as correct. The commission has also decided that if truck companies wish to incorporate, or file articles of association, they must go through the same process as a railroad and be controlled by the State Railroad Commission.

To Teach Foreign Trade Routine

NEW YORK, Jan. 28—A valuable document, to assist shippers and manufacturers in their foreign trade work has been published by the National Assn. of Manufacturers, through their foreign trade department. The work is a 50-page booklet, entitled, "An Export Order and Allied Topics." As the title suggests, this book aims to visualize through a series of letters, all of the documents, forms, and successive steps involved in the handling of a typical export transaction from the time the inquiry is received from a prospective customer to the payment of the goods obtained. With the aid of this book an intelligent clerk would soon be able to master the complete routine of foreign shipments. The book contains all of the forms used for export shipments, as well as tables containing matters of information to shippers, such as language spoken in different countries, consular fees, and general information. Those desiring copies should communicate with the National Association of Manufacturers, New York City.

National

TWELVE CYLINDER CARS

STAMINA THAT IS ECONOMY

THE immediate success met by this new twelve-cylinder National Touring Sedan constitutes a splendid recognition of the fact that true war-time economy is a matter of efficiency.

No more would we think of limiting the strength, the ability, or the convenience of this practical traveler than we would of suggesting that the equipment of our troops overseas be curtailed.

These times test the soundness of every man's economy-doctrine, and they emphasize the wisdom of the dealer who sells and of the customer who buys this car in which stamina is the source of important savings.

With either the six- or twelve-cylinder airplane-type engine, it is a trustworthy car for all purposes; staunchly built to meet the exactions of shrewd judges and of long, varied service.

Its fuel, tire, and maintenance costs are surprisingly low.

The versatility of the carriage of this National, easily closed for winter or opened for summer, is enjoyed without sacrifice of touring range.

It affords the advantages of a cold weather equipage and of a warm weather tourist at the cost of one car.

The new National spreads its inherent utility and economy over the entire year and thus, from its initial cost, it yields the utmost in service value.

Behind these economy-facts the prosperity of National dealers is firmly entrenched.

Get behind this big National Movement

"We believe that the movement which you are backing is going to be one of great value to the public."

W. B. RENTON
General Manager, National Automobile Mutual Casualty Co.

"If some plan is devised for careful periodical inspection of automobile brakes, there would be considerably fewer automobile accidents."

FRANCIS M. HUGO
Secretary of State New York

An open letter to the trade:

The new Brake Inspection Movement is of such importance to motorists in general, and to the trade in particular, that we wish to add to it our endorsement and to ask your assistance in furthering it.

Object of the movement

The object of the movement is to decrease the number of preventable accidents due to imperfectly adjusted or defective brakes.

An official of the Motor Truck Club of America says that 60% of the accidents caused by brake troubles could be avoided.

One reason for these accidents is that the brake bands are located out of sight and any deficiencies are consequently liable to pass unnoticed until they have developed into serious troubles.

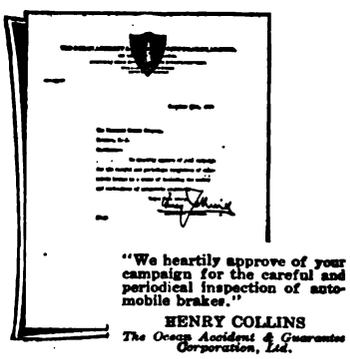
The plan of the "Brake Inspection Movement" is to prevail on every motorist to have his dealer inspect his brakes before the touring season opens. It is called to his attention that the brake-rods can usually be turned up two or three times before new brake lining is needed. A simple adjustment of the equalizers will frequently make the brakes safe instead of dangerous.

Less important evils have been corrected

Glaring headlights have been forbidden by legislation in many states. It needs no argument to prove that defective brakes are even more of a danger. It will probably be but a short time when motorists will be compelled by law to have their brakes inspected at regular, stated intervals.

Aside from the broad civic interest which you will have in this movement it will also command your support for business reasons.

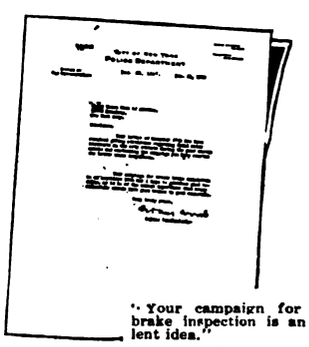
Where motorists are being urged so strongly to have their brakes inspected it is evident that this must result in increased brake lining business.



In closing, allow me to urge most strongly that you give this movement your active assistance, as well as your endorsement.

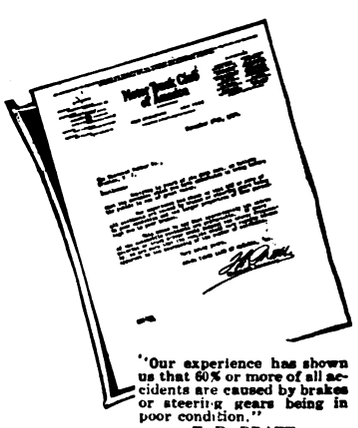
Sincerely yours,

H. F. Blanchard



(General Sales Manager)

THERMOID RUBBER COMPANY
Trenton, N. J.



"We heartily approve of your campaign for the careful and periodical inspection of automobile brakes."

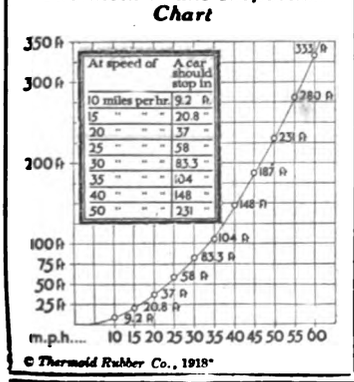
HENRY COLLINS
The Ocean Accident & Guarantee Corporation, Ltd.

"Your campaign for better brake inspection is an excellent idea."

ARTHUR WOODS
Former Police Commissioner New York City

"Our experience has shown us that 60% or more of all accidents are caused by brakes or steering gears being in poor condition."

T. D. PRATT
Motor Truck Club of America



V^2 / 10.8 Will your car do this?

Automobile engineers have proven that when brake mechanism is right and road conditions average, any car should stop at distances and speeds given by the chart.

V^2 means the square of the velocity or speed of your car. 10.8 is the proven factor of retardation under average road conditions. This factor decreases on smooth slippery roads to 6.7 and increases as high as 17.4 on rough worn roads. The chart represents the average condition and other conditions can readily be figured by changing the factor within the given limits.

Remember that your brake mechanism is not "right" unless its brake lining has the ideal co-efficient of friction. The better the brake lining the quicker your stop.

Axle and bearings of a two-ton truck

Prices (F. O. B. Detroit) Chassis $985. With cab and windshield, $1025; Combination box stake gate body, $1075; Stake gate, $1080; Express canopy, $1095.

Certainty—that is what you want—a truck you can sell confidently to near neighbors. Millions of dollars' worth of truck business will be done in the next few months; you know it. But you are afraid of the "*ought*-to-be-good" unproved trucks that suddenly are being offered on every hand. You can't take chances. You have a local reputation to build up and maintain.

HERE is certainty for you—a truck that has PROVED its merits, its capacity, its durability, its economy. It is the Maxwell; a truck design throughout, not an adapted passenger chassis. It has ten feet length of loading space; trouble-proof, mud-proof transmission; and the famous time-tried Maxwell engine, the most efficient engine of its type in the world. It has proved itself, in the severest use, "the best truck for the worst roads" . . . Every one of them you sell will enhance your local reputation. . . . Enormous production is fast being overtaken now by enormous orders. . . . Wire us today for our offer to dealers.

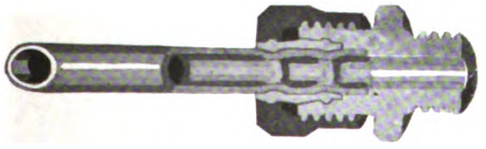
Engineering Experience Proves

DOHNER

HIGH COMPRESSION COUPLINGS



the only effective couplings

The ring is one of the main features of the Dohner Coupling. The rings on either side of the thimble are pressed into the tubing to be connected by simply tightening up the nut.

The several parts of the Dohner coupling consist of the main body of the coupling, the tapered nut and the tapered thimble. In adjusting, the end of the tubing is slipped through the nut and thimble into the body of the coupling up to the shoulder, and by simple tightening up the nut the operation of fastening the tube in place is automatically performed.

Tightening the nut automatically compresses, or transfers, the rings from the outside to the inside of the thimble. Thus the rings are "bit" into the tubing, producing a practically welded joint—absolutely air tight. Troublesome and unreliable soldering and tedious thread cutting are avoided, and all possibility of dangerous leaks absolutely eliminated.

The Dohner Coupling is a really effective coupling. This coupling is absolutely **Leak Proof**, and is the **only** coupling unaffected by vibration. Practical experience and scientific tests **prove** these facts.

"Reconnectability" of the Dohner Coupling is important. It can be disconnected by loosening the nut in the ordinary manner. Connection can be made again by tightening the nut, and coupling becomes as effective as before.

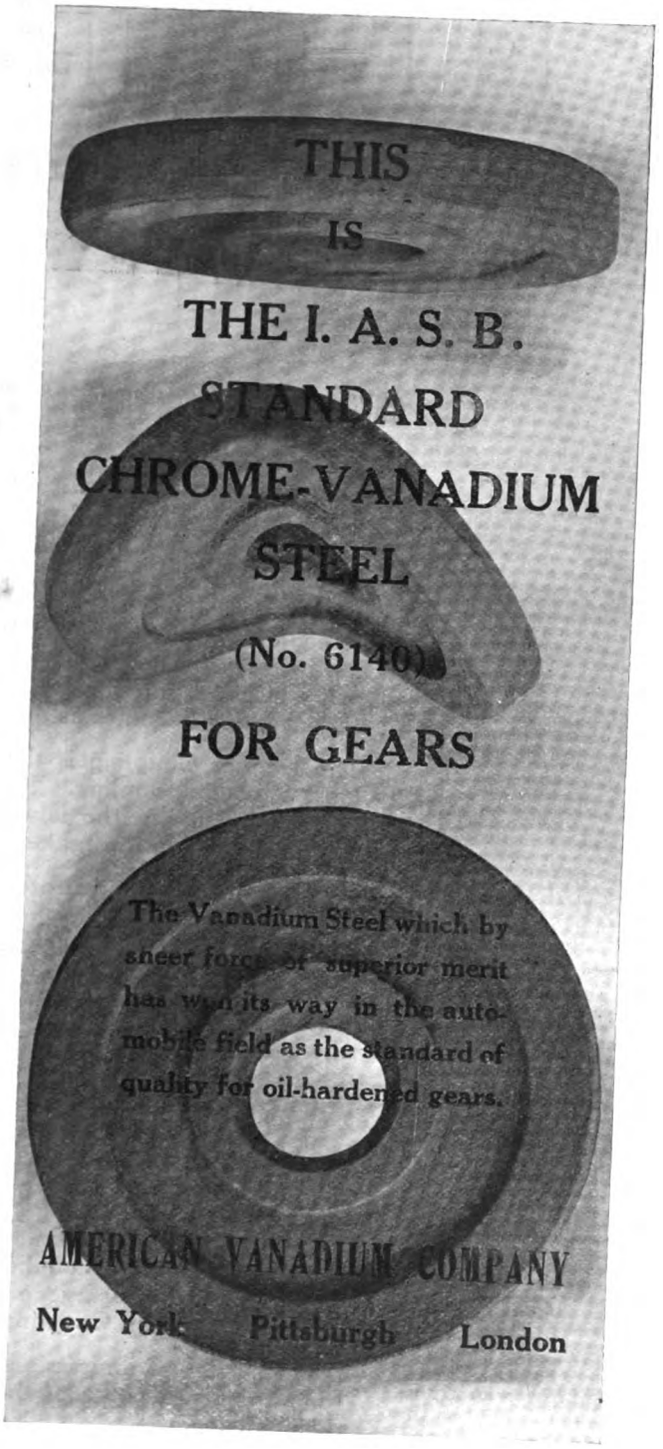
The Dohner Coupling is the most economical as well as the most effective coupling. Its slightly higher first cost is more than made up by the labor saving which its ease and simplicity of installation make possible.

This coupling is made for use with any metal, the hardness not interfering with the effectiveness of the coupling, which is made of steel or brass, as conditions require.

Dohner High Compression Couplings are coming into general use on oil and gasoline lines in automobiles, airplanes and motorcycles, and on steam lines in steam cars and locomotives.

Dohner Couplings are in use on several motor cars. Such well engineered motors as the Buick and the Maxwell use Dohner Couplings exclusively. This year the Buick Motor Car Company will use 3,000,000 Dohner Couplings.

Three years ago the Baldwin Locomotive Works, after an exhaustive study of couplings for use as a steam gauge connection for the passage of live steam, adopted the Dohner High Compression Coupling.



Dohner High Compression Couplings are especially adapted for airplanes because of their light weight, their stability and their efficiency.

THE DOHNER LINE IS COMPLETE, INCLUDING UNIONS, ELLS, TEES, ETC. PAT'D JUNE 13, 1916

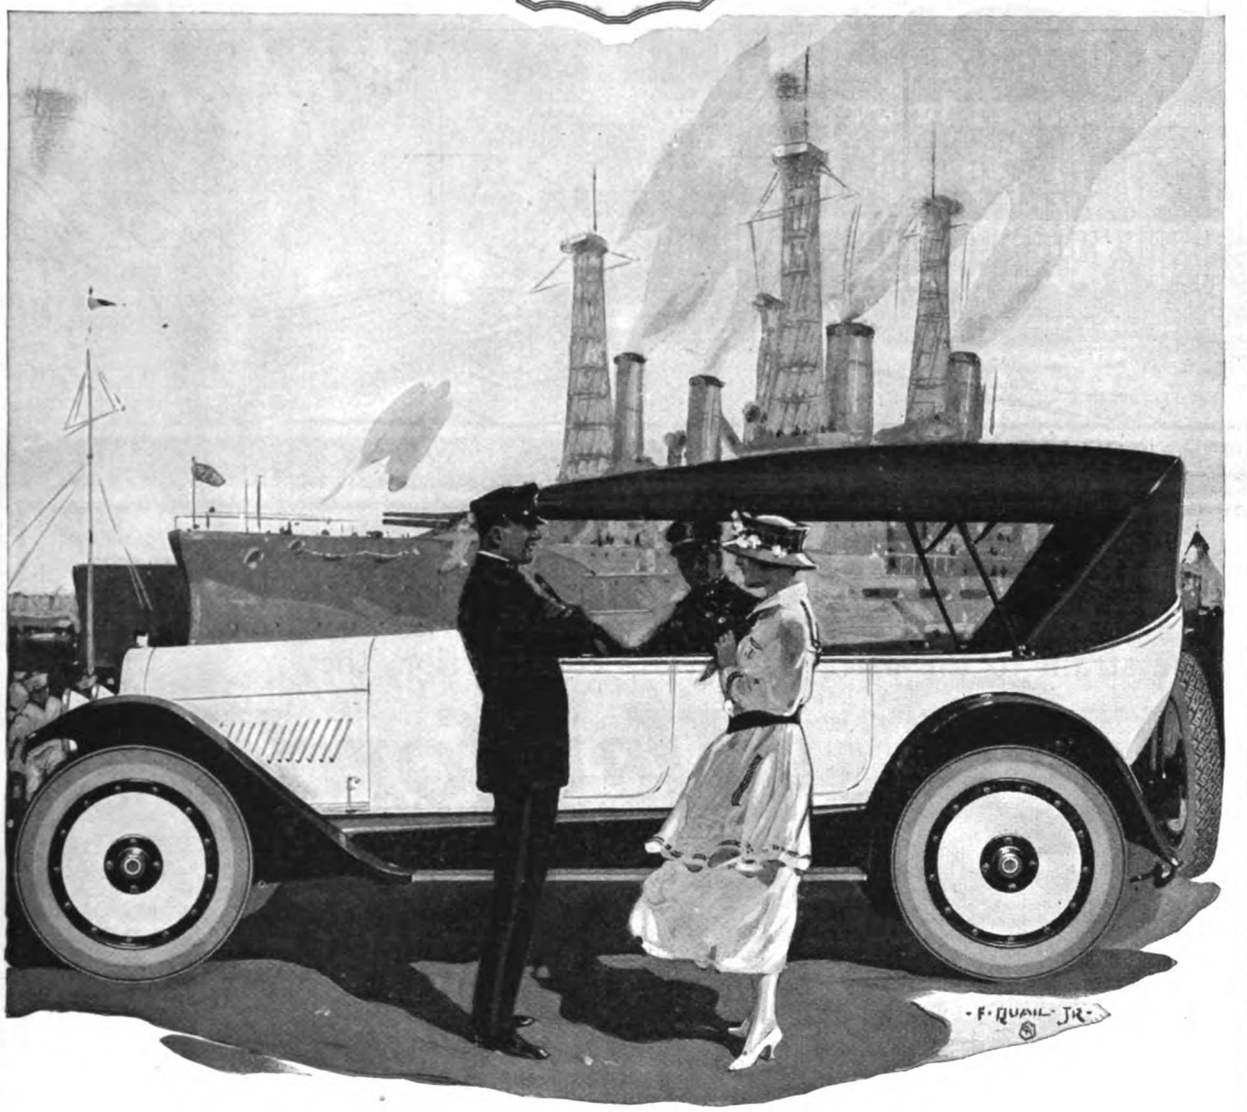
How Westinghouse Helped to Design Your Car

To be effective, every part of the electrical equipment has to fit the engine as the piston rings fit the cylinder.

A good starting motor, a good generator and a good ignition unit might combine with a good engine to make a poor electric power plant.

Electrical efficiency is made certain in Westinghouse-equipped cars by Westinghouse engineering co-operation—by building the starting motor, lighting generator and ignition unit into the power plant instead of just adding it to the engine.

Westinghouse engineers work weeks, or months if need be, in the car builder's drafting room and factory, to assure plentiful current supply for battery charging, to determine just the force that will best start the engine and to provide for it in the starting motor and to protect the battery by a quick start with little current.



So, Westinghouse engineers are not only specialists in designing motor-car electrical equipment, but they co-operate with the car builder in the interest of the car user. And this co-operation is one of the reasons why buyers who know prefer Westinghouse-equipped cars.

Just Off the Press

A revised and enlarged edition of our well-known **Library of Automobile Engineering** is just off the press. This up-to-the-minute work answers fully 10,000 questions on the repairing of all types of pleasure and commercial cars. No car owner, chauffeur, garage owner or repairman can afford to be without it. Sign and mail the coupon! It will bring you a complete set for seven days' examination and actual use. If the books fail to please, return them at our expense. If you decide to buy, pay the low introductory price at the rate of **50c a week.**

Mr. L. P. Coester, Philadelphia, Pa., writes: "When I first got your books I was earning $18.00 a week as a repairman. Now I am paid a salary of $30.00 weekly, and make considerable extra money in my spare time."

Mr. M. C. Armel, Royston, Ga., says: "Since reading your books my salary has been increased $40.00 a month. I am now a garage foreman with seven men under me."

Automobile Engineering—1918 Edition

The 1918 edition of the **Library of Automobile Engineering** is the newest and most complete work of its kind obtainable. Practically every type of pleasure and commercial car is described and illustrated, including 1918 models. Two entire volumes are devoted to the various ignition, starting and lighting systems, and hundreds of new wiring diagrams have been added. Welding, vulcanizing and public garage operation are thoroughly covered. Five thick volumes, 5¾ by 8¼ inches, flexibly bound in genuine morocco leather, gold stamped; 2,500 pages, 2,100 illustrations, wiring diagrams, etc., that make difficult points as simple as A-B-C. Written in plain, every-day language. Concise and to the point. Carefully cross indexed for quick reference.

Sent for Seven Days' Trial—50c a Week

If You Buy!

Don't send a penny. Just put your name and address in the coupon and we'll send all five volumes to you. Pay only the small shipping charge when they arrive. Read them—study them—use them as if they were your own for an entire week. If you don't like them after 7 days—send them back at our expense. If you keep them, send only $2.00 within 7 days, and then $2.00 a month—**50c a week**—until the introductory price of $17.80 has been paid. The regular price of this set will be $25.00.

What the Books Cover

Explosion Motors, Welding, Motor Construction and Repair, Carbureters and Settings, Valves, Cooling, Lubrication, Fly-Wheels, Clutch, Transmission, Final Drive, Steering, Frames, Tires, Vulcanizing, Ignition, Starting and Lighting Systems, Wiring Diagrams, Shop Kinks, Public Garage Design, Equipment and Operation, Electrics, Storage Batteries, Care and Repair, Steam Cars, Motorcycles, Commercial Trucks, Glossary.

A Year's Consulting Service FREE

With each set we give you, absolutely free, a year's Consulting Membership. The regular price is $12.00, but you get it free with the set. Put your perplexing problems up to a staff of automobile experts. Ask them as many motor questions as you wish for a whole year free! A Chicago garage man writes: "This service alone is worth more than the cost of the books."

Mail the Coupon

Don't Send Us a Single Penny

Your name and address on the coupon brings the five books to you, shipping charges collect, for seven days' trial, returnable at our expense if they fail to please. This offer is open to every person within the boundaries of the United States and Canada. Act quickly before rising paper costs compel an increase in price. Send coupon today—NOW.

Never Primes It!

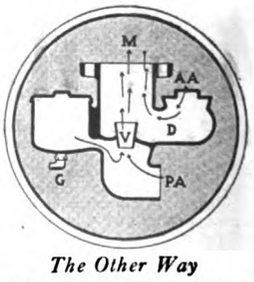
for Passenger Cars, Trucks, Tractors

VAN BRIGGLE CARBURETOR

One Principle for all Motors

Instant **Starting! No priming—no spinning—no "warming up"—even in *coldest* weather! These, among the many other unusual Van Briggle features, are timely points which cause hundreds of users to write us letters like that of O. L. Teague's above. Illustrated descriptive booklet free on request. *Send for it.* ¶ JOBBERS AND DEALERS: The Van Briggle is as easily handled as tires. Small stock meets any need. New opportunity for profit and service. Write for proposition.**

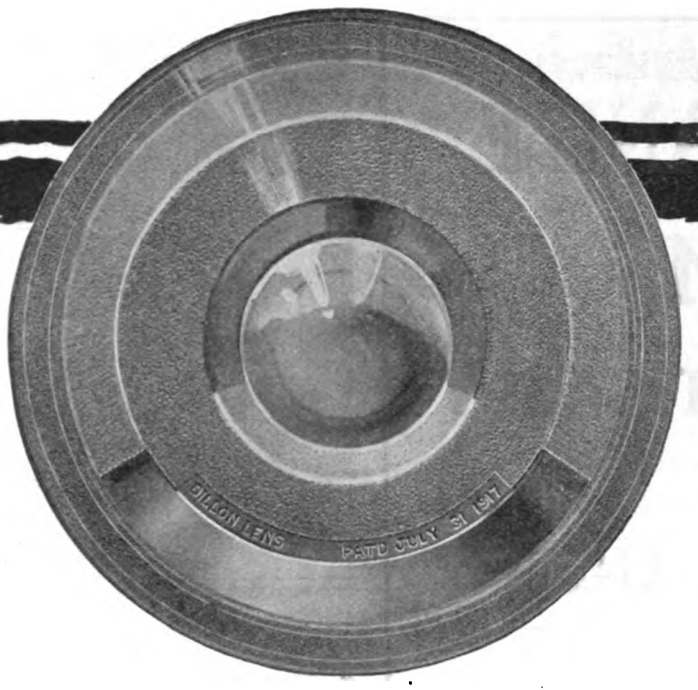
KEY TO DIAGRAMS: PRIMARY AIR (P.A.); AUXILIARY AIR (A.A.); GASOLINE (G); MANIFOLD (M.); MIXING CHAMBER (D.); VENTURI TUBE (V.); LOCATION OF MANIFOLD ON HORIZONTAL TYPE (Z.).



The Van Briggle Way

EXPLANATION OF DIAGRAMS

Because of the peculiar construction of the Van Briggle's primary air chambers, the primary air enters the venturi tube in a whirling, swirling movement, breaking even the poorest gasoline into the most minute particles. The primary mixture then enters the mixing chamber. The auxiliary air, traveling across to the manifold MUST PASS THROUGH THE PRIMARY MIXTURE. Two mixtures are thus assured in the Van Briggle Carburetor—each thorough and absolute. A thorough mixture and complete vaporization mean EVERYTHING to your motor. Compare the Van Briggle Way with The Other Way. There *is* a difference!



VAN BRIGGLE MOTOR DEVICE CO.
431 North Capitol Avenue, Indianapolis

The Other Way

THE bull's-eye in the center concentrates and magnifies a long-range stream of light, which is deflected below eye level by the reflected light from the clear glass immediately above. The mottled glass diffuses a wide path of light, while the bottom portion of clear glass provides necessary side and front lighting.

Be Sure Your Lens Is Perfectly Adjusted!

TOO often a lens is blamed for poor performance when it is not the fault of the lens but of its adjustment.

You may argue that some lenses require no adjustment, but while this is claimed as a virtue by some lens manufacturers it is often a very real weakness.

The Dillon Multi-Vision is so designed that it gives perfect results only when perfectly adjusted. But you should remember that it is constructed on **definite scientific principles**—and, moreover, that it is quickly and easily adjusted.

Once adjusted, it cannot turn loose in the rim, and it gives permanent and uniformly dependable service day in and day out. The Dillon is the SAFEST lens in America—a statement that remains unchallenged, whether judged from the standpoint of the law or the viewpoint of the motorist.

Dealers: Play safe with your reputation. Sell the Dillon, satisfy your trade and increase your general business. See your jobber. Or write. Use the coupon below.

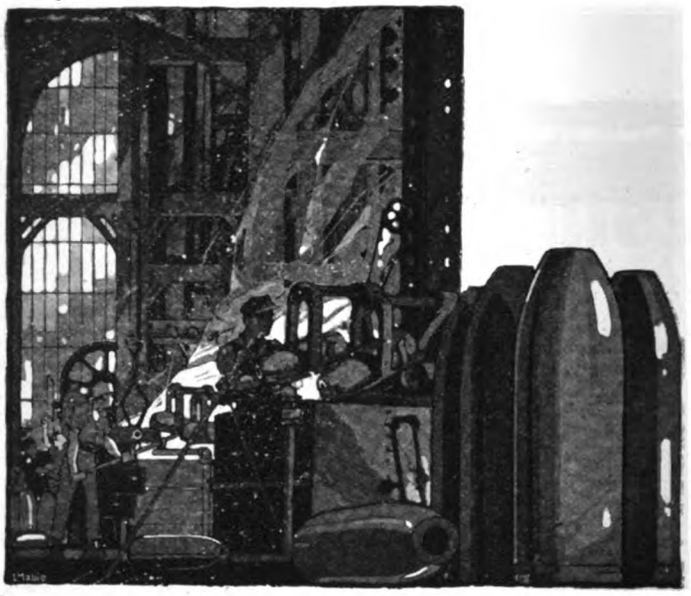
GALVANIZE RIMS AUTOMATICALLY IN MEAKER UNITS



Deposit a heavy, bright, uniform coating of pure zinc on all rims for your cars—the galvanized finish that looks good and is good.

Well galvanized rims are bright when they come from our machines and just as bright after they have made many thousand miles on your machines.

Superior Meaker Galvanizing will not cost you as much to produce as out-of-date, inferior, dark-colored, thin zinc coatings that do not even protect rims from rusting while they lie in storage.

Forward us a set of rims and felloe bands and we will give you some interesting figures.

Quality Snap Rings are shipped promptly and in perfect condition

THE Piston RING COMPANY
SPECIALISTS IN PISTON RINGS
03 Sanford St. Muskegon, Mich.
Makers also of Sta-Tite Rings

RUSCO
BRAKE LINING

Rusco brake lining has been the choice of leading manufacturers for a number of years, because the peculiar construction and long wearing qualities of Rusco have earned for it an unequaled reputation for long, consistent and efficient service.

Rusco is woven on specially constructed looms, and has for a base a superior quality of long fibre asbestos. This is impregnated with our secret wear-resisting, oil, water and dirt proof compound.

Rusco brake lining always comes out pre-eminent in every test to which it is subjected. The character and severity of these tests has been left entirely to the car manufacturer, and it is because of the success of these tests that Rusco has been chosen by them for their regular factory equipment.

If your cars are not now equipped with Rusco brake lining, we will welcome an opportunity to send you samples or put at your disposal the services of our engineering experts, who are prepared to offer suggestions regarding your particular requirements.

Why not make us prove our claims in your own way? We await the opportunity.

37 factories representing an equipment of 25,000 shuttles and 450,000 sq. ft. of floor space guarantee immediate deliveries.

A C Carbon Proof
For Fords, Overlands and Studebakers

How Often Must You Clean Your Plugs?
Ford—Overland—Studebaker Owners

The new *AC Carbon Proof Plug* will permanently rid you of plug trouble and keep your motor running on *all* cylinders *all the time.*

The Reason

A deposit of carbon on the smooth surface of the porcelain is what causes short circuit with ordinary plugs. With the AC Carbon Proof plug the porcelain is provided with a number of ribs having saw tooth edges which attain a sufficiently high degree of heat to burn away the carbon. This keeps the edges free from deposits and breaks up any possible short circuit.

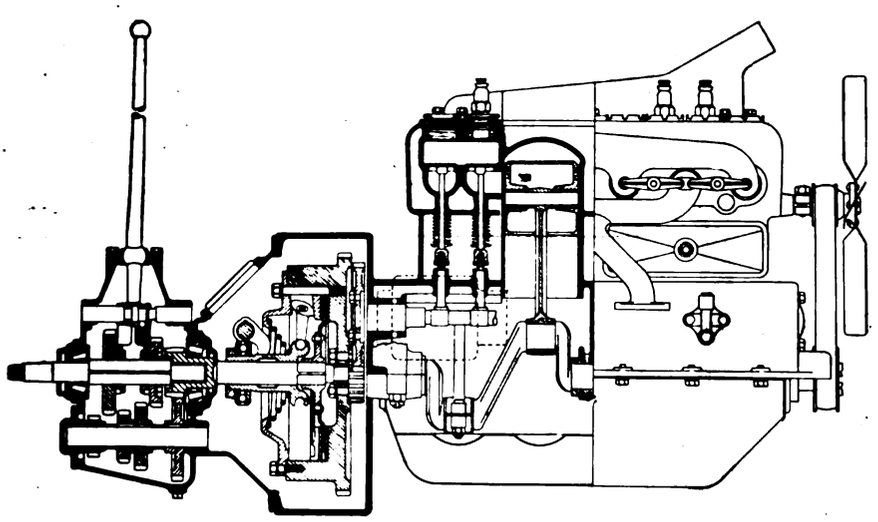
H & K Metal Stampings have been developed and refined to a point approximating perfection, and are setting new standards of economy and dependability everywhere.

ENCLOSED CAR BODY MODE

More beautiful and luxurious than ever before, have been pronounced the H & K body designs, in hardwood-framed steel, under active production at the works in Philadelphia.

Illustration shows the latest H & K Steel Body for the Paige Sedan. The daring yet graceful lines, luxuriously upholstered interiors, the smartness and individuality displayed in this work, equals that of the most expensive custom-made, and appeals to all lovers of the beautiful in automobiling.



Our great works at Philadelphia are engaged on the finest enclosed body work for several of the foremost cars of the country—reflecting the buyer's keen appreciation of a really valuable and enduring product, made entirely complete, ready for application to the chassis, and now being shipped in large quantities daily.

Suggestion is made for your engaging space here for producing your requirements in the most successful steel enclosed bodies; steel stampings of all kinds; complete cushion and back springwork, etc. Inquiries and drawings to the nearest office.

PATENTED

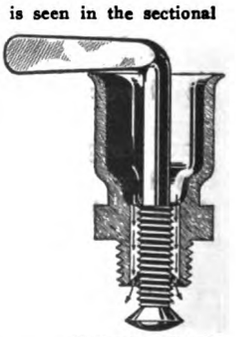
KANT KLOG
THE PRACTICAL PRIMING CUP

The Kant-Klog Primer

is rapidly being adopted as standard equipment by automobile builders because—

it is an innovation of efficiency and low cost—

it solves the problem of cold weather starting to the entire satisfaction of the user and can't clog with carbon because of its very construction.

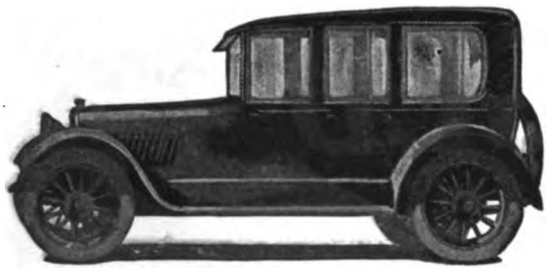


The simplicity of the Kant-Klog Primer is seen in the sectional view. No part of the valve is exposed. There is plenty of clearance for the free flow of gasoline direct without waste when priming. There is no chance of carbon getting past and collecting on the seat. There is no need of removal even after months of non-use.

The more Kant-Klog is used the better its seating action.

Quotations on variations of our standard design to suit different type motors—promptly furnished.

Kant-Klog prices are surprisingly low.



Write today for particulars and free sample.

Note the Simple Construction

Save Money Without Sacrificing Appearance

In this time of nation-wide economy, are you finding ways of cutting costs—and still retain quality? One item of saving—and it's no inconsiderable part of motor equipment either—is

GLASS

We have a mighty acceptable substitute for polished plate; and whether you use it on closed cars, windshields, clock faces, oil gauges or what-not, you will find it optically perfect. It looks well, too—and of course it's very moderately priced.

Write us your requirements, and let us tell you why this glass will serve your needs so well, why it costs less—and all about it.

Steel Balls Daily

Not a single case of breakage

IT is difficult to conceive of a production of 25,000,000 steel balls. It means billions in service in a short time. Yet it is even more difficult to conceive of these billions of Hoover Chrome Steel Balls doing daily service in 95% of all cars, in every form of ball-bearing mechanism, **with not a single case of reported breakage in our four years of development.** Yet that is the Hoover record due to a hard surface, tough center construction, which provides for steel contraction and expansion and allows for fatigue in service. The Hoover Ball has replaced all foreign balls, is finer in construction and uniformity of measurement. Let our laboratory service build the ball for your need. Booklet free.

Hoover Steel Ball Company, Ann Arbor, Mich.

No. 14½ Becker Universal Miller.
Brown & Sharpe Lincoln Type.
1 Twist Drill Grinder.
1 Emery Arbor.
24" Lodge & Davis Shaper.
4-spindle Die Sinker.
12" Hack Saw.

Wickes Machinery Company
Jersey City, N. J.

Do You Want a Good Lathe

or any other kind of used machinery? Tell us about your machinery wants. We'll find the man who has just what you need. Address Service Classified Department, Automotive Industries.

A Quick Turnover—Manufacturers!

The odd parts and material of all kinds left over from this and maybe previous years' manufacturing can be quickly turned into cash—through the Clearing House Advertising Columns of

Automotive Industries

No lot too small or too big to clear up. Send us a list of your odds and ends, and without in any way obligating you we will submit a specimen Clearing House Advertisement along with advertising rates.

For a Quick Turnover Address Clearing House Dept.

HUNDREDS of machine shops are ready for Contract Work. Tell us your needs and we will find the shop that will handle the work for you. The Automotive Industries, Contract Work Department, 239 West 39th Street, New York.

If your manufacturing requirements cannot be handled by firms now advertising, we should appreciate the opportunity of locating a firm that can render such special service as your business may demand. Our investigation of the contract situation as it now stands places us in a position in which we can be of valuable service to the manufacturers of the automobile industry. If interested, please communicate with the Contract Work Department, Automotive Industries, 239 W. 39th St., New York City.

WANTED

Information as to concerns who can handle the following lines of Surplus manufacturing work:

Castings (steel, brass, bronze or aluminum)	Machine Parts	Drop Forgings
Dies	Gear Cutting	Lathe and Milling Machine Work
Tool and Die Work	Grinding	Patterns (wood and metal)
Metal Stampings	Cam Cutting	Plating
Punch Press Work	Bar and Clutch Work	Automobile Stampings
Screw Machine Work	Forgings	

We have a very attractive contract work promotion proposition to present to any concern who can take on additional work or desires to feature their manufacturing facilities.

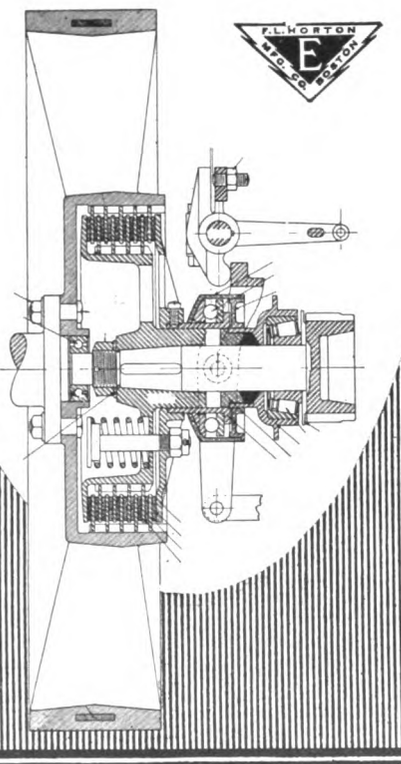
For the Clutch

You know the necessity for a facing that will wear—a facing which, throughout its life, will give the limit of service.

ELEKTRA
ASBESTOS FRICTION
CLUTCH FACING



simply and entirely meets this necessity. Reasonable in price? Yes—but made of the best selected materials and to exacting specifications.

Elektra is an interwoven fabric of asbestos and metal which is chemically treated to combine the heat-proof qualities of asbestos with the high friction of an indestructible material. Manufacturers—by all means use Elektra.

Write today for details.

Some Are Born Money Makers; Others Have It Made For Them

The very same men and the very same policy that ran Maxwell from 2,000 a year to 100,000 and left many a Maxwell dealer well fixed for life are now guiding the good ship Chalmers.

If Maxwell dealers took in $2,500,000 in 1913-14 and $12,000,000 in 1916-17 what do you suppose is going to happen to Chalmers dealers in 1920?

At the end of 60 days of operation by Maxwell the Chalmers sales have hopped 200 per cent; and no pressure behind them, either.

A good many dealers with a keen eye for making money are getting in on Chalmers.

RUSCO

BRAKE LINING

for standard equipment

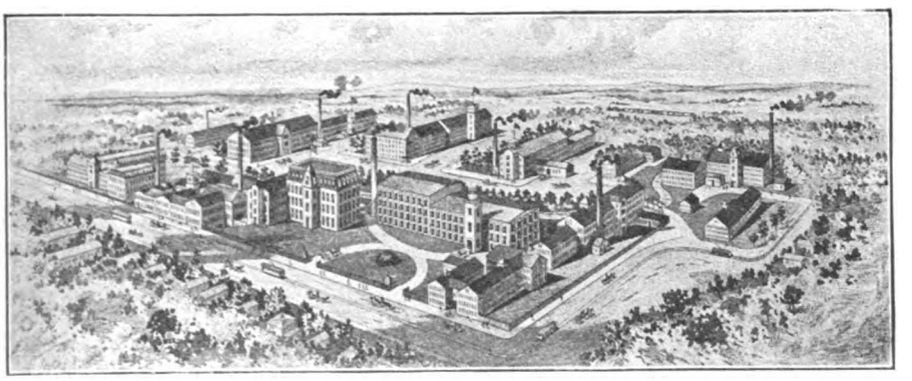
Every car which goes out of your factory must be truly representative of the standard upon which you are building your business, and it is to your advantage to maintain as high a standard as you possibly can.

Rusco will help you. If your cars are factory-equipped with Rusco brake lining, they will create and maintain a standard in brake lining efficiency that cannot be equalled.

Rusco gives a sure, uniform braking power—ready at an instant's notice with just the necessary degree of friction, evenly distributed over the whole braking surface. Rusco is impervious to oil, heat or dirt, and will give the same, uniform, efficient grip when it is worn "paper-thin" as the day it was first put on the brake-bands.

The long, consistent service which Rusco gives, is the result of the superior quality of extra long fibre asbestos used. This is interwoven with wire on specially constructed looms, and then impregnated with our secret compound.

If your cars are not now equipped with Rusco brake lining, we will welcome an opportunity to send you samples for tests, or put at your disposal the services of our engineering experts, who are prepared to offer suggestions on your particular requirements.



THE RUSSELL MANUFACTURING CO.

WYMAN-GORDON

CRANKSHAFTS

FOR ARMORED CARS AND "TANKS," BATTLEPLANES AND SUBMARINE CHASERS, require strength, balance and structural reliability in unusual degree.

THE WHOLE MIGHT OF AMERICA'S INDUSTRIES is needed adequately to fill the demands of War—and every man is needed, every forge must glow. But to meet the special requirements of these forgings calls for more than speed.

UNQUALIFIED COMPETENCE MUST UNDERTAKE their fabrication. No sudden speeding up, no hasty rearrangement of factory methods, can take the place of long training in the production of only the best.

TO WYMAN-GORDON COMES WORK OF THIS CHARACTER, because forgings of infinitesimal accuracy, of flawless construction, technically correct in all respects, are the only kind we have *ever* produced.

The WYMAN-GORDON GUARANTEE WAS READY *IN ADVANCE.*

It antedates the War—by many years.

We should be glad to co-operate in the solution of your forging problems.

WYMAN-GORDON CO.

INSURE YOUR RADIATOR

THE only way you can be positive that your radiator won't freeze up this winter is to use a non-evaporating, anti-freeze preparation. The present high cost of alcohol—its low boiling point—and quick evaporation make it impractical. Besides, you are asked to conserve the supply of alcohol for use in explosives.

Does Not Evaporate

Johnson's Freeze-Proof does not evaporate so one application is sufficient for the whole winter unless the solution is weakened by leakage of the radiator or hose connection, through the overflow pipe, or by boiling over.

JOHNSON'S FREEZE-PROOF

Johnson's Freeze-Proof should be used wherever you wish to prevent water from freezing—in automobiles, gas engines, tractors, electro-lighting and heating plants, traction companies, etc. One box will prevent 3½ gallons of water from freezing at 5° below zero. For lower temperatures increase the portion of Freeze-Proof.

Absolutely Harmless

Johnson's Freeze-Proof contains no oil and does not interfere with the cooling system. It will not injure rubber, cloth, packing, or metal of any kind. It does not rust or corrode any metal. Johnson's Freeze-Proof is economical and easy to use and it raises the boiling point of water 12° to 25°.

Johnson's Freeze-Proof is put up in packages containing 6½ lbs. net which retail at $1.50 each in the U. S. A. One package will protect a Ford from freezing at 5° below zero. For larger cars use two packages to protect to 5° below zero, and three packages to protect to 20° below zero.

Write for our new booklet, entitled "Keep Your Car Young". — We will send it to you free and postpaid. — The information in this book will enable you to greatly improve the appearance and the performance of your car.

Tractor Problems Discussed at Chicago Meeting

Fundamentals of Tractor Design, Engine and Transmission Gear Design Dealt With—Industry Too Young to Permit of Rapid Standardization —Meeting a Success

CHICAGO, Feb. 1.—To-day's tractor session of the Society of Automotive Engineers marked one of the first real steps in advance in this department of the society's work since the broadening of its field to fully include all automotive products. Broadly speaking, the work accomplished to-day was more the laying down of a future program of development than an accomplishment of progress in engineering detail. The work of the S. A. E. to-day was the sketching of the outline into which the picture of future developments will fit as the industry shapes itself and becomes more mature. The registered attendance was 239.

As President Kettering said, "Not five per cent of the demand for tractors has been filled." The industry is in its infancy, and we know so little of the tractor and so little of the problem which confronts us that it would be absurd to attempt to deal with detail at this early date.

This feeling was common to the other engineers present, with the result that the broadest aspects of the tractor problem were considered. To again quote President Kettering, the tractor problem is fifty per cent engineering and fifty per cent psychology. Unless a tractor company studies the psychology of the farmer along with the engineering problems of the tractor itself, it will fail.

The program of the meeting included four papers on tractor service, tractor design, tractor engines and tractor transmission, presented respectively by George Cormack, Appleton Mfg. Co.; George Strite, consulting engineer; H. C. Buffington, Minneapolis Steel & Machinery Co., and E. R. Greer, Emerson-Brantingham Co. These four papers gave a well-balanced program and one which was worthy of a much longer time for discussion than was afforded by the brief three-hour session. Discussion was necessarily curtailed by the shortness of time, but what there was showed an interest which ranks as high as in any topic ever handled by the society.

George Cormack's paper on tractor service struck the true keynote of the meeting in departing from the mere technicalities of the subject and outlining with the broadness of the idealist the true purpose of the tractor. Cormack outlined the service that the tractor is to render this country in the time when agricultural products are such a vital factor in the welfare of the world. He spoke on the ethics of the manufacturer in forgetting the fact that he is primarily engaged in manufacturing for the purpose of making money rapidly.

In other words, tractor service means something more than the mere maintenance of the tractor in the field and in the repair shop. It means the broadest kind of service which can be rendered by machines which are built by concerns who do not put out a product in which quality is slighted and profit only considered. The author touched a responsive cord when he stated that manufacturers who have the good of their country at heart will not produce machinery which they know to be defective when this machinery draws from more worthy purposes the labor and material which are so sorely needed in these times.

Digitized by Google

The other three papers were concerned more strictly with the engineering phases of tractor development and fittingly rounded out the program so that President Kettering's estimate of the subject as 50 per cent engineering and 50 per cent psychology was reflected almost exactly.

Probably the biggest lesson in the engineering end of the program is held up for the attention of automobile manufacturers who are endeavoring to enter the tractor field. The differences in fundamentals between tractor and automobile engineering are so great that automobile men must bear them continually in mind unless they wish to waste vast sums of money in learning the lessons that are at their disposal if they will only recognize with an open mind the facts which have already been discovered by men who have studied the tractor field for the past decade.

As summed up by President Kettering, the tractor engineer must remember that the tractor differs from the automobile in one very important respect: "It will not coast for any appreciable distance when attached to three or four plows." When a machine is rated at 20 hp. it must deliver 20 hp. continually from one end of the day to the other. There can be no shirking on the part of the machine because when it is needed by the farmer it is needed badly and must run with or without attention so that it performs its tasks in the desired manner.

The War Dinner

The culmination of the program was in the war dinner held in the evening. More than 1200 were gathered at the biggest function ever held by the S. A. E. This war dinner was patriotic from its Hooverized menu to its highly patriotic speakers drawn from both military and civil life. A letter of greeting from President Wilson extending his appreciation for the efforts of the S. A. E. during the war and his hope for the best efforts of the organization for the future was read by H. L. Horning. A telegram of response to the President was dispatched to Secretary Tumulty asking him to present to the President the earnest wishes of the organization that the strength of the President should be reserved to carry the burdens of his great responsibility and to renew the pledge of the resources of the S. A. E. in aiding the government in attaining any ends that it may have in view.

The speakers were General Kener, commanding Camp Grant; H. L. Horning, and W. H. VanDervoort, who presided jointly; C. F. Kettering, president of the S. A. E.; Major W. G. Wall of the Ordnance Department, and a major attached to the French army. The speakers without exception dealt with the national problems in connection with the war and told how we are overcoming the great difficulties of raising within a few months an army that normally would require years to get together.

Volunteers for Ordnance

Captain Donaldson, of the Ordnance Department, asked for volunteers, during the afternoon meeting, for men to go to France as ordnance officers for all-around engineering service. He secured nearly twenty applications during the afternoon from men who are strongly interested in the tractor service and will probably have an increased number from the engineers in attendance.

No discussion followed the paper by George Cormack on tractor service, which was really as much a paper on manufacturing ethics as it was on pure tractor service. Mr. Cormack, in a short summary after he had read his paper, cited the fact that last spring tractor engineers in this country had received cablegrams from the other side asking for 35,000 to 40,000 tractors, and for information as to where to get them.

As a result of this, representatives of the largest tractor companies met and discussed the subject, with the result that it was necessary to reply that we could not furnish them at the present time owing to the fact that the industry was not developed to an extent where satisfactory machines are being produced. Certain companies had stated that they could furnish the machines, but in the final analysis their own engineers had refused to stand back of them.

George Strite touched on the demand for the highest power, on the part of the farmer. He said that even in the days of the big tractor pulling eight or ten plows the pressure and influence exerted by the customer for just a little more power was almost irresistible and the temptation was continually to build something larger, although sound engineering knowledge pointed out that the smaller machine was sure to come into favor. Mr. Strite dealt with the difficulty of clearly explaining horsepower to the farmer, and stated that power should be rated as in terms of displacement or simple pull in pounds.

H. L. Horning, in discussing this paper, stated that the matter of the standard Liberty tractor for government use had come up in Washington from time to time and it was proposed at one time to adopt the Ford tractor as England had done, and other types were also considered, but finally no standard was adopted. It was the consensus of opinion that the tractor is not old enough to standardize. We are just starting on an era of big things in the tractor work and we will greatly regret it if we try to go too far with standardization which will hamper future progress.

C. F. Kettering spoke of the differences between automobile engineering and tractor engineering, and stated that owing to the fact that the tractor is continually under full load it is necessary for the automobile engineer to entirely revise his ideas concerning engine performance. R. E. Davis of the Moline Plow Co. stated that automobile and tractor engineers could learn much from each other, and one point which should be particularly closely studied is that of the automatic lubrication of parts. The farmer will not stop to lubricate his machine, and so it is necessary to so design the bearing parts that oiling is of an automatic nature as far as it is possible to make it so.

There was no discussion on the papers by H. C. Buffington or E. R. Greer. Mr. Buffington touched on the essential points to watch in the design of tractor engines.

E. R. Greer dealt with tractor transmission. He divided practice into two main schools in which one favored the rough open gearing and large plain bearings as opposed to those who insist on inclosed gears with anti-friction bearings. He also stated that the question of wheels as opposed to other methods of traction is far from settled. In his paper, which is printed elsewhere, he states that wheels must be of sufficient size, and should be five feet or more in diameter with tractor of 8 to 15 hp. draw bar for general farm work. He stated that the standard type of truck transmission does not need tractor requirement, and with necessary reduction of from 30 to 100 to 1 it is necessary to use several reductions.

"Of all the problems we have to contend with to-day, the fuel problem is the biggest. There is nothing moved on this earth to-day except what is done with the sun's energy. This has been stored up in all forms in the earth and we have used it lavishly. Have we overdrawn our account? To-day there is arising a question: Can we go ahead? Must we curtail? It is the greatest question which confronts us, and yet we are not giving it proper consideration."—*President Kettering at the S. A. E. war dinner.*

Traction Transmissions*

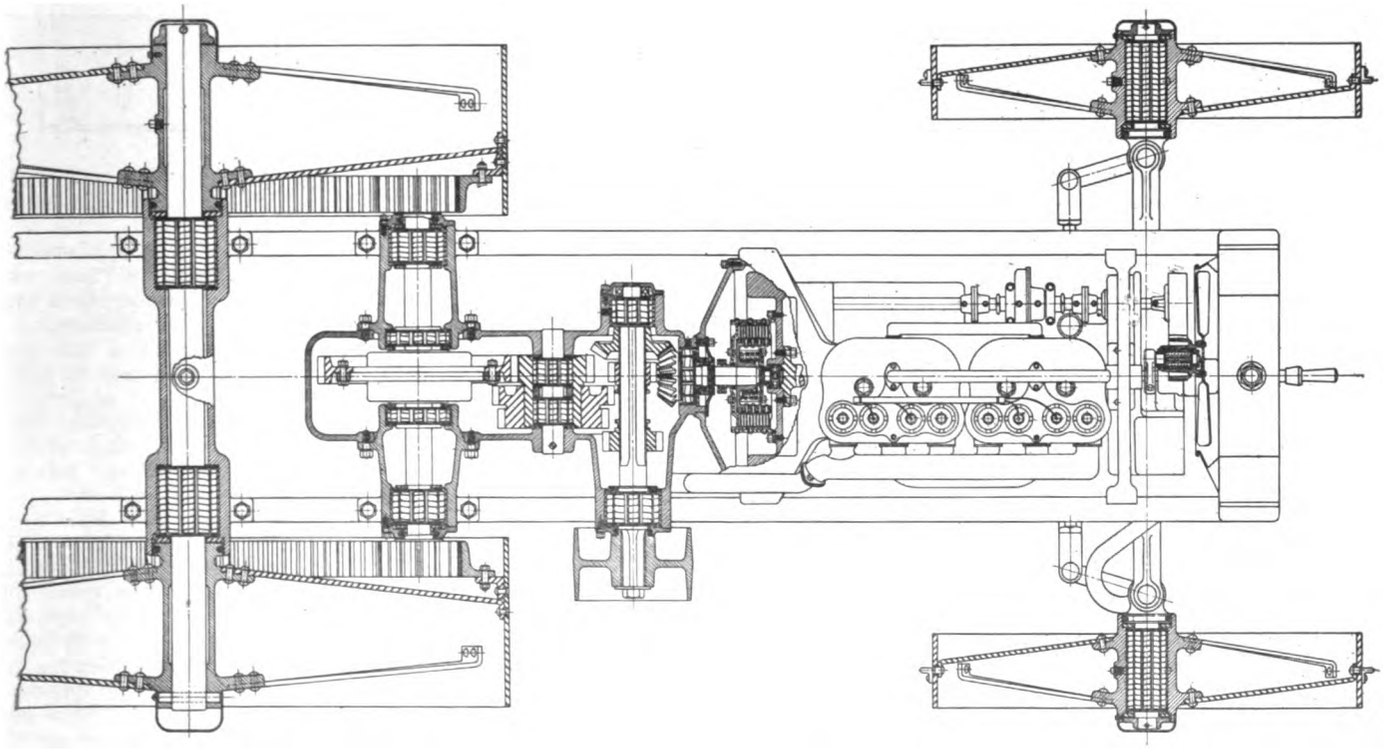
No Uniformity of Practice in Tractor Transmissions Yet Discernible and Little Chance for Standardization at Present—Pros and Cons of Different Transmission Features

By E. R. Greer

WHEN we speak of a tractor transmission we generally mean the entire power-transmitting device, from the engine to the ground and including the pulley for belt work. Tractor transmissions are still in an early stage of development. They are composed of a number of groups of parts that are arranged differently in nearly every case, so that they cannot be classified without dividing them or making a special class for nearly every tractor now being manufactured.

There are differences of opinion among tractor men regarding many of the most vitally important features of tractor transmissions. Some believe in rough open gearing and large plain bearings; others insist on cut hardened inclosed gears and anti-friction bearings.

The question of wheels for traction versus the caterpillar is far from settled. The right size of wheels for wheel tractors seems to be further from being agreed upon than anything else, and it is one of the most important things in tractor design.



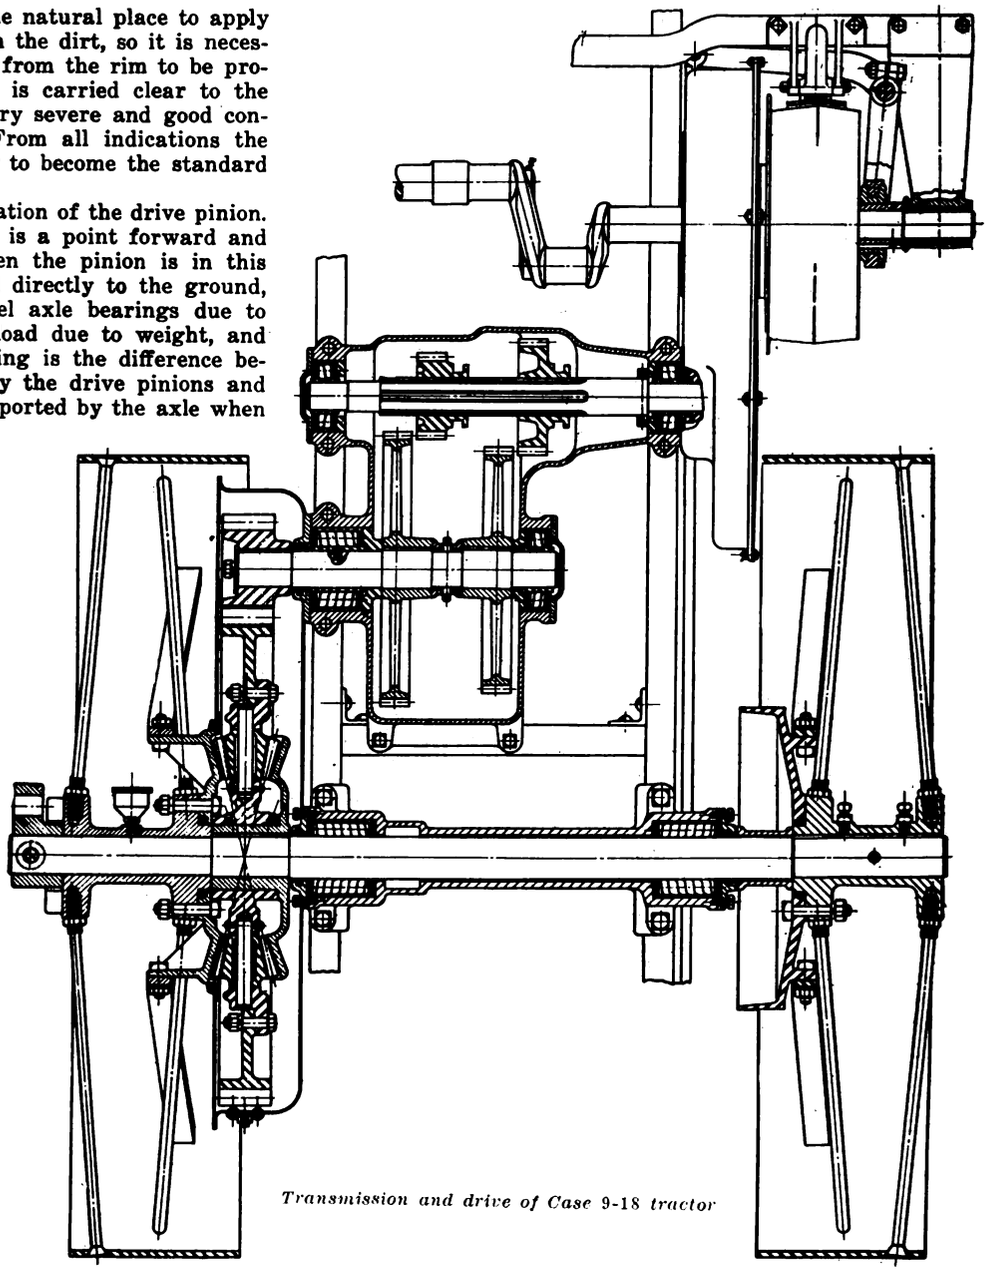
The design of a tractor transmission is affected greatly by the design of the wheels or caterpillar tracks which are to give the traction. The matter of traction is of first importance to a successful tractor, and it is right here at this point that opinions differ widely. The transmission design is largely affected by the decision as to the kind of traction to be used. The caterpillar with its large surface contact has an advantage on marsh land or sand where the top soil is tougher than the ground beneath. But it is at a disadvantage when just after a rain the ground is muddy on top and harder below. It can bridge a small ditch, but becomes blocked by one too large to bridge, and side hills or side draft cannot be taken care of as efficiently as when wheels are used.

Wheels must be simple and relatively inexpensive, and must be of sufficient size and provided with lugs to give good traction. For if a tractor wheel once starts to dig, it will not climb out of its hole unless the load is released. On smooth, hard ground a very small wheel gives efficient traction, but on newly plowed sandy soil or on land where there are washed out ditches a large wheel must be used. The matter of suitable lugs is of utmost importance. On some kinds of ground a spiral cleat at about a 45-degree angle will give double the tractive effort that can be obtained from the same wheels with straight cleats or spikes.

Large Reductions Required

For efficient general farm work with wheel tractors of 8 to 15 drawbar hp. the drive wheels must be 5 ft. in diameter or more, and the problem of the best way to drive the wheel is very important. The effort being applied to the

*Paper presented at the tractor meeting of the S. A. E., held in Chicago on February 1.



Plan view of tractor with four-cylinder engine, multiple disk clutch, two speed and reverse transmission and internal gear drive

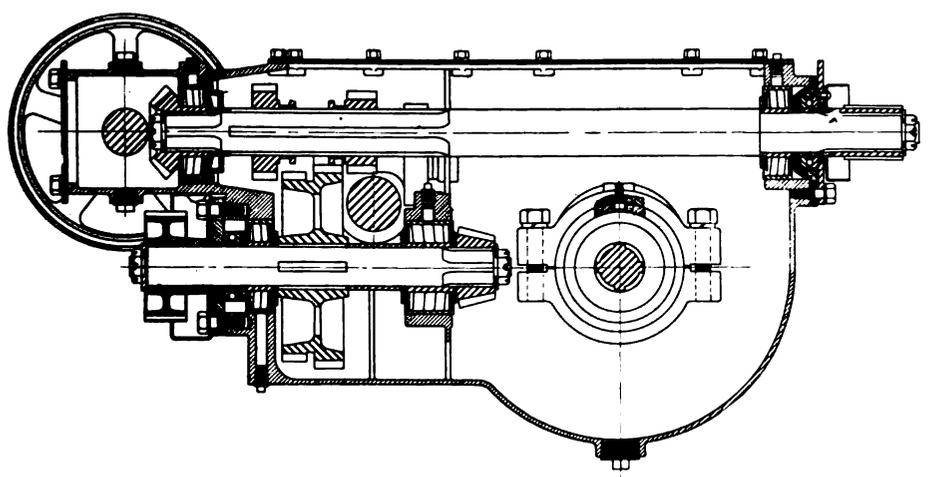
Digitized by Google

ground, it follows that the rim is the natural place to apply the power, but the rim runs right in the dirt, so it is necessary to take some point far enough from the rim to be protected from the dirt. If the drive is carried clear to the axle the tortional strains become very severe and good construction expensive and difficult. From all indications the inclosed internal gear drive is likely to become the standard traction wheel drive.

The next important item is the location of the drive pinion. There is one best location, and that is a point forward and a little below the wheel axle. When the pinion is in this location the driving force is applied directly to the ground, so that the load on the drive wheel axle bearings due to power delivered is opposite to the load due to weight, and the resultant load on the axle bearing is the difference between the driving effort delivered by the drive pinions and the weight of the tractor that is supported by the axle when the tractor is standing. In other words, the drive axle bearings are practically floating when the tractor is pulling a certain load. At less load the bearing pressure is down and at greater load the pressure is up. The strain of the drawbar pull is carried by the drive pinion bearings through the pinion teeth to the drive wheel rim.

Transmission and drive of Case 9-18 tractor

Raising of Forward End



It is the lifting effect on the front end of the tractor that results in its forward movement. There are a number of tractors that have enough power to raise the front end clear of the ground so that the front end weight is the limit of their pulling power. These tractors are very difficult to guide and are of no use at all on hills. Enough dead weight must be carried on the steering wheels so that the tractor can be guided on the steepest hill.

The front wheel drive offers an easy solution for hilly ground, as in this case the reaction from the load is down on the rear steering wheels. There is no tendency to tip up, and the harder the pull the more positive is the control. The rear wheels must be ample to carry the additional load, and the difficulty is in arriving at a suitable arrangement to handle the implements when the front wheels are the drivers. While the steering mechanism may be complicated, the power transmission can be simple, the weight can be placed mostly on the drive wheels, and ditches and hills can be easily negotiated. The four-wheel drive immediately suggests itself, but the mechanical complication and expensive construction make it prohibitive.

Protection of working parts is not easily accomplished in tractor transmissions. An argument used by those who favor open rough cast gearing is that farmers cannot keep transmission grease or oil clean and that some grit is always put into the case at every filling. They claim that as long as parts cannot be kept clean, they wear out and may as well be made simple, open, and to operate without lubrication or when covered with dirt.

One unprotected drive known as "the roller pinion drive" has been quite successful on small tractors, as it can be made to last a season, is very cheap, and is easily replaced. Perhaps the worm drive can be taken as the opposite extreme, because the excessive tooth pressures, together with the vibration and dirt, have prevented its being a success no matter how carefully it is built.

As the users of tractors become

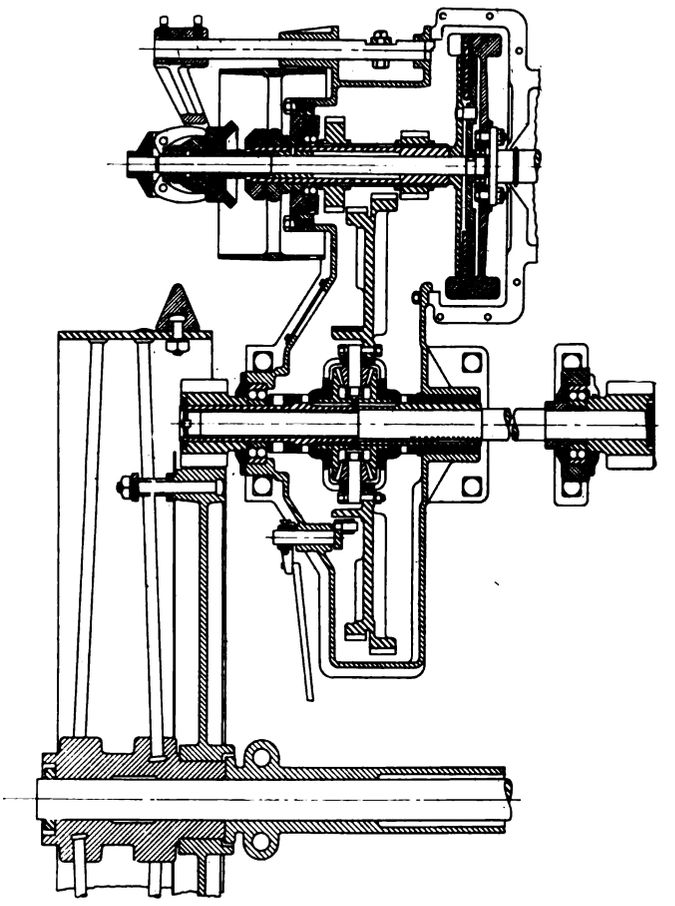
Vertical section through Emerson-Brantingham transmission

Digitized by Google

educated so as not to abuse their machines, then thoroughly protected, well-made parts will become more general. To-day simplicity is vital if a tractor is to be successful, but education is increasing the demand for well-made, efficiently protected parts.

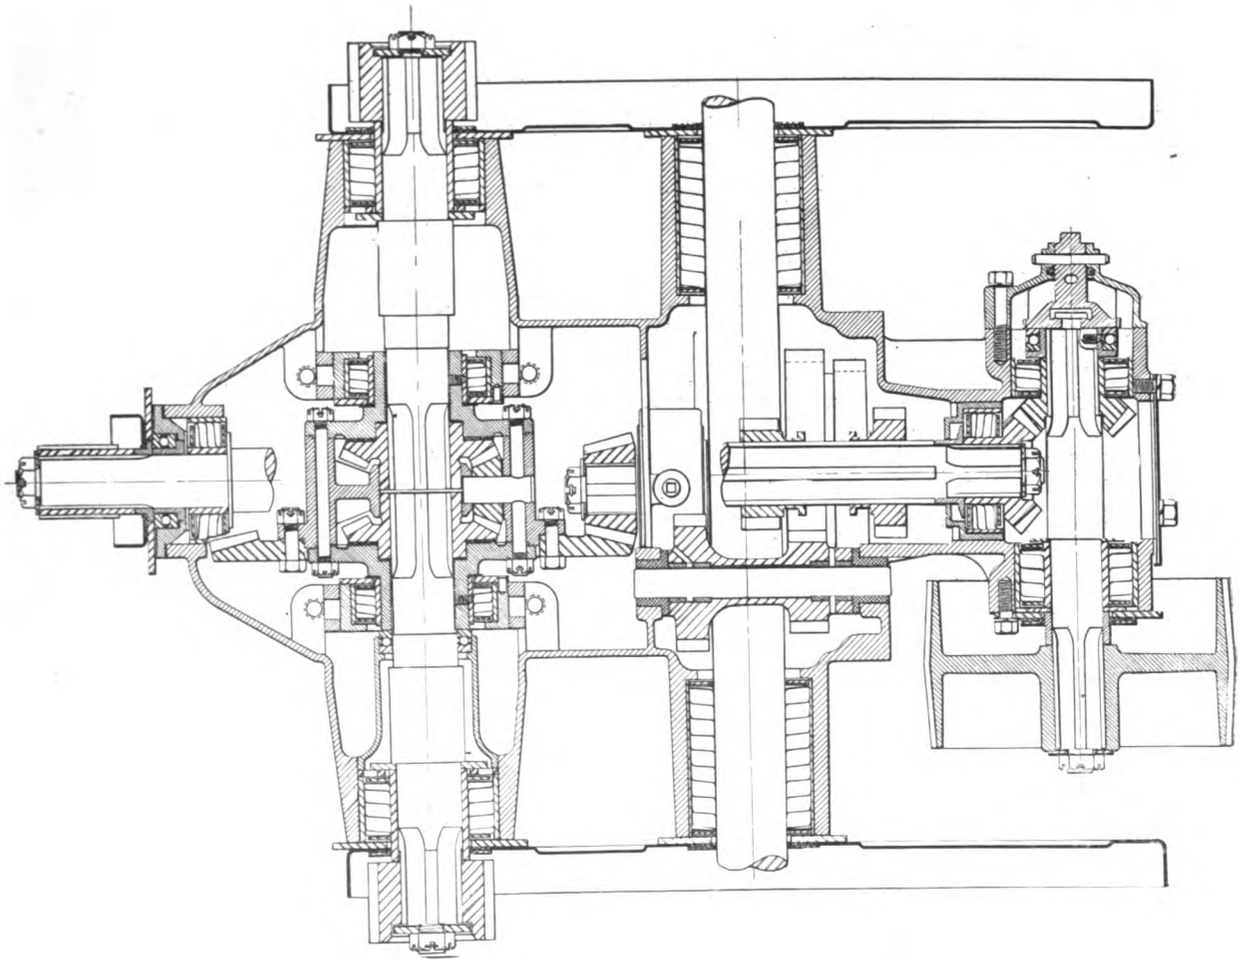
A notable advance in tractor transmission design is that anti-friction bearings are becoming so widely used. It has been found that an ample, non-adjustable, anti-friction bearing may last indefinitely in tractor service. Transmission bearing trouble has been a common tractor fault in the past, and its elimination is a step ahead.

Shafting used is usually ordinary mild steel, as gears and bearings generally have to be of such size that the shaft sizes are ample. It is very important that splines be used instead of keys.



Truck Transmission Not Suitable

The standard type of automobile or truck transmission does not meet tractor requirements at all. The amount of gear reduction is too small, no belt pulley is provided for, the change speed is wrong, the parts are not ample, and it cannot be applied to a good tractor design.



The total gear reduction in a tractor varies between 30 to 1 and 100 to 1, so several reductions have to be used. I think it is best to discuss each reduction separately and especially to consider the final reduction by itself, although in some cases entire transmissions are built as a single unit.

In general all tractor transmissions are driven from the engine through a friction clutch and without the use of universal joints, except that some clutches are designed to take care of any misalignment. Cone, disk, shoe, band clutches and friction drives are in use. The cone clutch and the internal expanding shoe clutch are most common.

First reduction gearing may be almost any kind that one can imagine, and the amount of reduction from 1 to 1 to as much as 8 to 1. The change in speeds and the reverse are often worked in on the first reduction, but also it is very common to have the second reduction used for this. Where

the engine shaft is not parallel to the drive wheel axis the first reduction gears are often bevel. There is considerable advantage in having the bevel gears as the highest speed gears. It reduces cost and also provides a chance to get a belt pulley on a fairly high-speed shaft without the necessity of using a separate set of gears and clutch.

First Reduction Change Gear Least Expensive

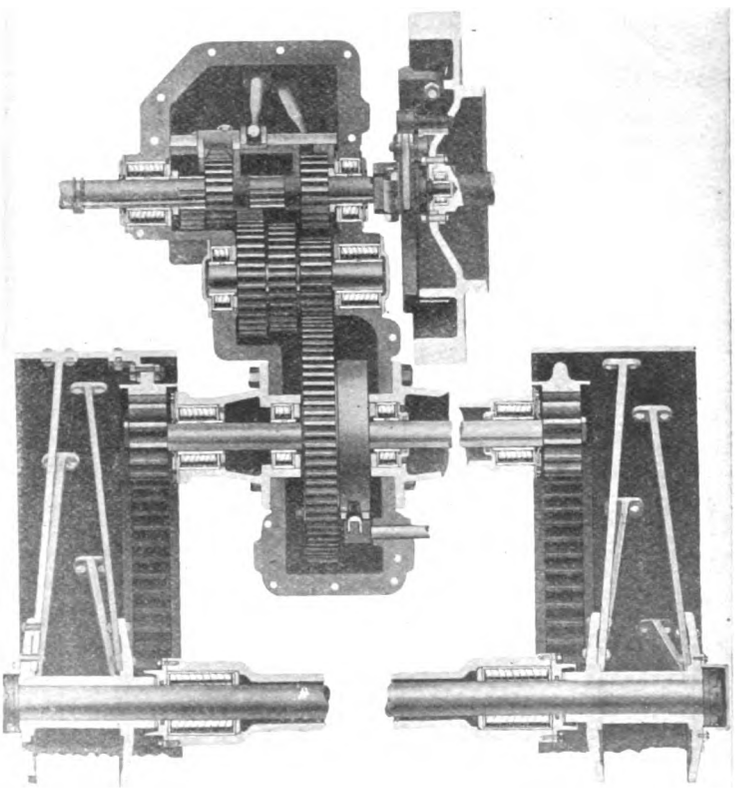
When a spur reduction is used first the change speed gears and reverse are generally a part of it, as they can be much smaller and cheaper in this position than in the next reduction. This arrangement is general on tractors where the engine sets crosswise and is also used to some extent where motor shafts are lengthwise the tractor, even though this arrangement necessitates a larger and more expensive set of bevel gears in the second reduction and also the use of a separate set of gears for the belt pulley.

It is usual that change speed gears are arranged so that the pinions slide on the drive shaft and engage large gears on the driven shaft. No divided shafts or counter shafts, as are found in automobile transmissions, are used, except for reverse gears. This arrangement means that all gears are disengaged except the ones actually being used, and also that no idle gears or extra reductions are necessary for different speeds. Another advantage in this arrangement is that all change gears are disengaged when the belt pulley is to be used. Tractors are used for belt work for long continuous runs and gears or shafting running idle are undesirable because they waste power.

Tractor transmission with a first reduction by bevel gear

The second reduction is sometimes the final drive, though this is not often the case. Usually it is the drive to the shaft which carries the differential. If the differential can be placed in this position, ahead of the last reduction, considerable expense can be saved because the parts can all be made much smaller.

Differentials have to be very strong and ample, as tractor wheels are always slipping and keeping the differential parts working all the time. Differential locks are considered good practice. Brakes for holding one side for short turning are often used, but brakes for stopping, while necessary, are not very important.



In cases where more than three gear reductions are used the extra reduction is used either to gain compactness or to provide for some special arrangement of parts.

Number of Speeds Provided

Tractors are used for plowing a large per cent of the time, and generally are operated at from 2 to 2¾ m.p.h. Many have only a single speed, but most of the late designs have two or three speeds. When there are three speeds one is lower and one is higher than the plowing speed, and when only two speeds are provided the second speed is usually slower than that for plowing. The difference between speeds is nearly always between 30 and 40 per cent.

A tractor transmission is really a series of compromises, each part being affected by those related to it, so it is no wonder that there is such a difference in design. A difference of opinion as to the proper location of the belt pulley alone will very materially affect the entire transmission arrangement. At present there is little chance of valuable transmission standards. It will require more time and many tests to prove what is best.

SOME time ago it was announced that a successful incombustible substitute for celluloid, manufactured from soya bean cake, had been discovered in Japan. Further particulars of the new product have come to hand. It is called "Satolite," after the inventor, Professor Sato, and a company for its manufacture has been started with a capital of £200,000. Satolite is a galalith made of the glucine of soya bean, coagulated by formalin. It is said to be produced much more cheaply than celluloid.

Fundamentals of Tractor Engine Design*

Substantial Crankshafts, Liberal Bearing Surfaces, Removable Cylinder Heads, Voluminous Water Spaces, Long Strokes, Conservative Rating as Kerosene-Burning Engines, Force Feed Lubrication and the Greatest Possible Accessibility Among Features Advocated

By H. C. Buffington

So much has been said about the fundamentals of tractor engine design that an attempt to write upon the subject at this time, when the tractor is undergoing such rapid changes, is apt to incite derision. However, we all have our own ideas, gathered from experience, and the only way to be convinced as to whether or not we are right is to express ourselves publicly.

"Fundamentals of Tractor Engine Design"—the subject seems simple at first thought, and immediately the general outline of a four- or six-cylinder engine flashes through one's mind. We picture a smooth iron-clad masterpiece solidly mounted upon the frame of a racy looking tractor. We do not at first consider the carbureter, magneto and all the other contraptions necessary to make it run.

Presently we ask ourselves, What are the essentials of a successful tractor engine; what have we gathered from actual experience and not from theory? What the writer has in mind is not an engine of higher speed and light construction, nor a heavy two-cylinder engine, but a four-cylinder one with certain elements of construction which have proved their worth, and these elements of vital importance are the ones which the writer wishes to dwell upon.

Crankshaft

The crankshaft being the essential element around which the engine is constructed deserves first consideration. Too often this part has been neglected in the fight for lightness and cheapness; the following proportions, however, have shown up well under trying conditions. Personally the writer prefers the three-bearing shaft. There are, however, some points in favor of the two-bearing type, in that the two center cylinders can be placed close together, and, of course, the doing away with one bearing is an advantage. On the other hand, a very heavy shaft is necessary, and, generally speaking, the three-bearing type is best suited for large engines.

The crankshaft stress should not exceed 12,000 lb. per square inch, with an explosion pressure of 300 lb. per square inch. This will give a good solid shaft free from vibration, which is so destructive to bearings.

Bearings

A good proportion for the crank pin bearings is to take 57 per cent of the cylinder diameter for the pin diameter and 1.2 of this diameter for the length. This will give a projected bearing area of half the cylinder area, thus keeping the pressure down to 600 lb. per square inch. The main bearing pressures should not exceed 400 lb. per square inch for the front bearing, 400 lb. for the center and 250 lb. for the rear, taking the center of the bearings as the points of reaction. You will note the rear bearing pressure is very low, but this is necessary to take care of the extra pressure caused by the transmission shaft, if it happens to be out of line with the engine, which is often the case.

Removable Head

Whether ell-head or valve-in-the-head is rather a matter of choice. Those who prefer the ell-head perhaps use it because, as I heard it expressed, "It is a good old family horse." On the other hand, the valve-in-the-head is chosen

*Read at S. A. E. tractor meeting, Chicago, Feb. 1.

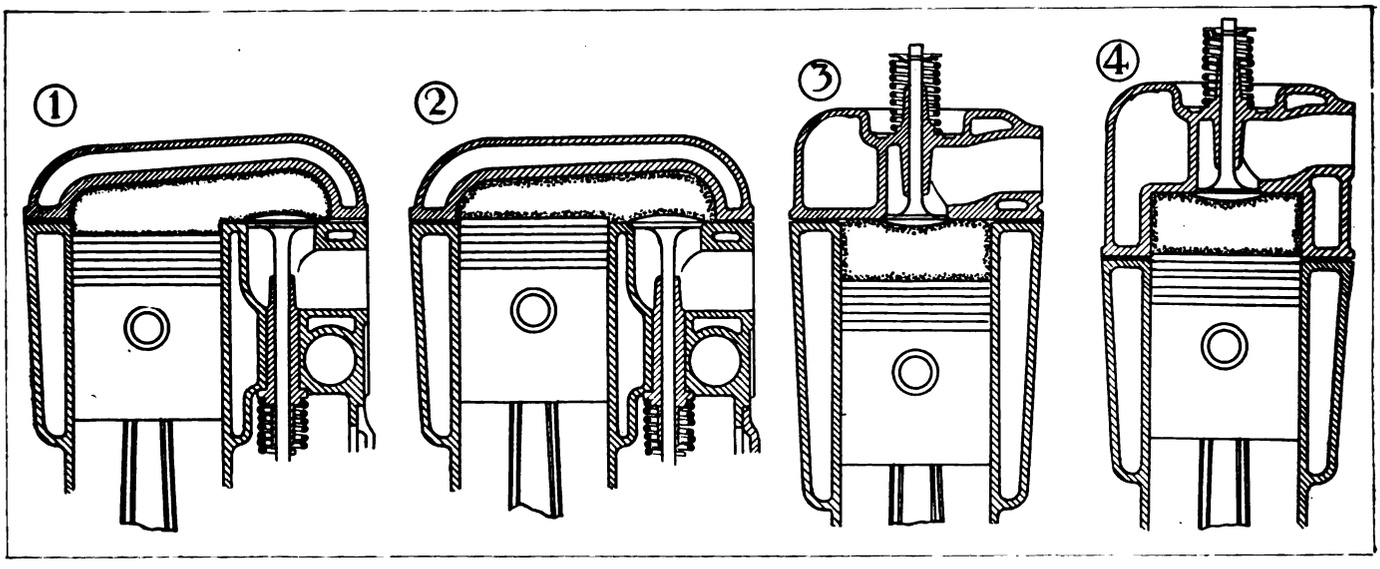

Fig. 1 Fig. 2 Fig. 3 Fig. 4

Digitized by Google

by the more particular who do not want to be outdone in points of efficiency. The removable head, which has been recognized by a great many engineers as a necessity, has not been appreciated by some. There are several important reasons why the removable head should be classed as essential, i.e., cleaning carbon, grinding valves, doing away with the troublesome valve cover plug, or valve cage and making it possible to adjust the compression for high altitude. The cylinder head should part on a line with or a little below the top of the piston, and not above, as the latter method makes it harder to clean and the piston cannot be removed without first removing the carbon from the cylinder walls. Figs. 1, 2, 3 and 4 show this difference. The difference in compression can also be taken care of much easier. There are many tractors working in altitudes as high as 8000 ft., and the changing of the head is a simple matter as compared with the changing of pistons.

Water Jackets

Liberal water space around the head should be given very close attention, as, unlike the automobile engine, a maximum load must be expected for a period of hours. An even thickness of combustion chamber walls is very essential for the same reason, and means for checking up the thickness should be very seriously considered. If, for instance, there be a hot spot in one cylinder, the carbureter must be adjusted for that cylinder or the result will be very disastrous. There will then be either preignition in one cylinder or excessive fuel leakage by the other three pistons.

Long Stroke Preferable

Theoretically, a tractor engine should not be pulled down below normal speed, but this is often done; in fact, at least 50 per cent of the time the operator will have his engine overloaded, and it is for this reason that the stroke should be at least 1.4 the cylinder bore. The long stroke engine is also very desirable, because with it the difference between the engine speed and final drive is not so great and permits of holding down the transmission gear diameters.

The transmission itself has a great deal to do with the necessity of flywheel capacity, and the higher the efficiency of the transmission, the greater should be the flywheel energy. The less efficient transmission acts as a shock absorber and lessens the shock on the crank pins, while, on the other hand, the shock is transmitted almost directly to the crankshaft. It can readily be seen why some engines with a small flywheel do not have half a chance to stand up. In calculating the flywheel, double the horsepower should be taken with 10 per cent variation in speed. The speed control on the engine should be about 10 per cent above normal.

Engine Rating for Kerosene

Engine rating on kerosene should be based on 800-ft. piston speed, and this rating should not be over 75 per cent of its maximum capacity on gasoline. Actual laboratory tests have shown the power output on kerosene to be within 8 per cent of that on gasoline, but under actual working conditions it is not practical to expect this.

A tractor engine before leaving the test block should not use more than one pint of kerosene per horsepower-hour when pulling its rated load. This fuel is to have a gravity not lower than 42 deg. Baume, and an open flash point of not over 120 deg. F.

Engine builders to-day are at a great disadvantage in not having a standard fuel with which to develop their engine. I wish to suggest that the S. A. E. establish a standard kerosene and a standard gasoline.

Manifold Head Control Essential

One reason why it is difficult to successfully run tractors on kerosene in the country is that the grade of kerosene used in small towns, which may be termed lamp oil, although its specific gravity is not so low, has a very high open flash point, and to use it in engines it is necessary, in order to vaporize it, to heat it to a very high temperature. This high temperature, of course, reduces the power. This fuel gives a very good light and there is no danger from explosions, but it costs more than the so-called distillate, which in most cases is an excellent fuel.

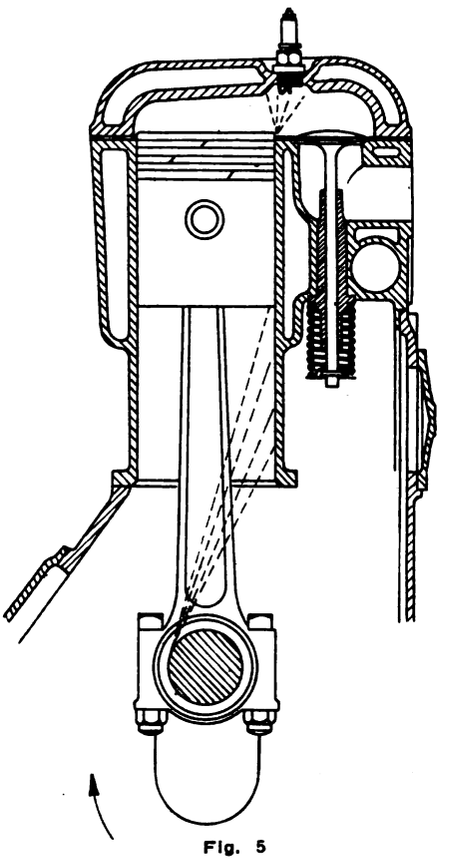

Fig. 5

This point pertaining to difference in fuels is mentioned merely to point out the necessity of controlling the heat between the carbureter and cylinders, and it is very essential.

The writer has often been advised as to the location of the spark plug, but after many experiments and sad experiences it has proved that the trouble is due largely to lubrication.

Proper spark plug location without a doubt would cure 50 per cent of the magneto troubles, and yet engines are designed without attempting to determine the proper location of the plug. Without hesitation the designer will place it over the intake valve on an ell-head engine or on the intake side of the valve-in-head type. Spark plugs should not be placed near the line of cylinder bore where oil from the piston will splash on the plug (see Fig. 5) or in line with the intake gases when using kerosene as fuel. A careless operator will either use too much fuel or too much water with the fuel, and with the plug directly in the path of the gas flow this will cause improper ignition.

The direction of crankshaft rotation will sometimes make it necessary to shift the plug to the opposite side, as the excessive oil thrown from the crankshaft will always lodge on one side of the cylinder (see Fig. 5). If the plug is on this side it will become fouled much quicker. Placing the plug over or near the exhaust valve has often been criticized, but aside from the fact that the spark plug itself will have to be replaced more often, it is the most reliable position.

Lubrication

Lubricating the tractor engine is the hardest problem in engine design at the present time, and it will continue to be so until a better method of using kerosene as fuel is employed. A most excellent oiling system has been developed for the automobile; in fact, it is as nearly perfect as anything that could be produced, but it has turned out to be a miserable failure when an attempt is made to use kerosene under actual working conditions in the field.

We dislike to throw lubricating oil away, and before doing so every effort should be made to prevent it, but, figuring from an economical standpoint, it is cheaper to use the lubricant only once and let it drain from the crankcase than it is to cause the destruction of the engine by too great economy of oil, as time is lost in making adjustments and repairs which are caused by the used-over oil, as it gradually becomes thinned by the fuel passing the pistons. The most reliable method of lubrication is to force fresh oil to each moving part, crank pin bearing, main and camshaft bearings, gears and cylinders and drain it into a reservoir from where it is drawn from time to time.

Every care should be taken to clean the air drawn through the carbureter and breather, as the oil supplied the crank pin must pass through a drilled hole, and any dust entering

Digitized by Google

the crankcase will gradually clog the passages. Any other method where oil is used twice, whether forced or splashed, will cause rapid wear. This is not the case with carefully operated engines, but we cannot expect unusual care from the average operator.

Accessibility

Hand holes placed in the side of the crankcase to make it possible to inspect the bearings are quite necessary, and the base pan should be light and easily removed. Every effort should be made to make it easy to remove wearing parts in making repairs and avoid crowding small nuts into corners and out-of-the-way places.

In conclusion I wish to say a word to the tractor designer on a subject which, though not relating to the essentials of engine design, is essential to the success of its operation.

Every effort should be made to provide accessibility to the engine, not only on the carbureter side but on all sides, and especially should sufficient clearance be allowed underneath. Allow plenty of room for removing the base pan; avoid, if possible, fastening tractor parts to cap screws and nuts used in fastening engine parts, especially the cylinder head bolts, as this only tends to discourage the operator in making necessary adjustments.

I cannot lay too much stress upon the importance of flexibility between the engine and the transmission drive shaft. It has been necessary to provide extra large bearings at the flywheel, to take care of vibration caused by the transmission and engine shafts being out of line, but this destructive feature can be remedied. I suggest designing a self-contained clutch mounted upon a stub shaft bolted to the flywheel flange bolts, and also a flexible coupling placed between the clutch and transmission. This construction not only takes the extra pressure off the crankshaft, but also allows the transmission bearing to run freely (see Fig. 6).

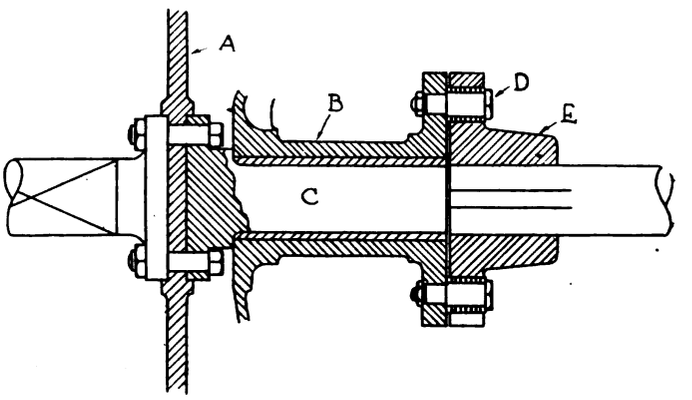

Fig. 6

War Problems Outlined at Automotive Dinner

CHICAGO, Feb. 2.—The war dinner of the Society of Automotive Engineers, held last night in connection with the tractor session, takes first rank as one of the most notable ever held by the organization. The attendance exceeded 1200, the banquet hall of the New Morrison Hotel being filled to overflowing.

The meeting opened with a letter of greeting from President Woodrow Wilson, expressing his hope that the organization would lend every effort to the great tasks ahead. General Kener, in command of Camp Grant; C. F. Kettering, president of the S. A. E.; Major W. G. Wall, of the Ordnance Corps, and a major attached to the French army were the speakers. The dinner was presided over jointly by Past-President W. S. VanDervoort and H. L. Horning.

C. F. Kettering's talk was the feature of the evening. In this he outlined the scope of the future work of the S. A. E., particularly in reference to the tractor field.

Major Wall spoke of the accomplishments of the Ordnance Department during the past nine months, and gave detailed figures on the munitions produced under the direction of this department.

General Kener spoke of the great necessity for man power and universal military training, and the major of the French army traced the progress of the military industries of France since the beginning of the war. Both W. S. VanDervoort and H. L. Horning spoke of the great work of the civilian experts in government work in Washington and also of the notable achievements of the members of the S. A. E. who are now enrolled in the Officers' Reserve Corps.

Past-President VanDervoort told how the Government is looking to the S. A. E. for so much of the Government work, and how proud the organization should be of such men as Howard Coffin, W. G. Wall, Howard Marmon and many others.

He bitterly spoke against what he called the "greatest of criminal errors" in not permitting the country to prepare during the three years that the other nations were at war. He stated that the criticism of the administration now going on is untimely, and that now is the time to uphold the President and not to criticise him. He said that a great work is being accomplished in doing in a few months what Congress should have had done during the last three years.

VanDervoort said that this is not the time for labor to talk of a certain number of hours' work, such as 8 hours or 7 hours, but now is the time to lengthen the period of labor only by the strength of physical endurance.

The men in the trenches need our support at home, and if we are privileged to have all the home comforts to which we are accustomed we should more than do our share in the tasks at home.

Major W. G. Wall told how the appropriations for the past few years for the Ordnance Department were inadequate, and hence this department was greatly unprepared until the beginning of the war. The Ordnance Department for this reason was up against a task the equal of which had never been known. Munitions for 3,000,000 men had to be prepared in 18 months. It is a big engineering problem.

Much of the material had to be made new, and some of it interchangeable with French—for instance, the 75 mm. and the 155 mm.—and necessarily there was some little delay before this could be brought into line for manufacture.

The greatest problems are the big guns and howitzers. It takes 9 months to complete one of the large guns, and the machinery to make them had to be built.

There are now eight large forge shops and many machine shops working on these, so that by next fall we will have more than 8000 cannon. Besides this there are thousands of the Enfield and the Springfield rifles which are the best rifles in the world.

There are ten large factories making the four-wheel drive units which are fitted with all types of bodies. A thousand of them, for instance, have machine shop bodies and others have gasoline tanks, anti-aircraft guns, etc.

In addition there are a number of types of Government trailers. There are 9000 tractors of caterpillar type in construction weighing from 18 tons down.

What the Automobile User Is Demanding*

How the War Is Affecting the Demand for Passenger Cars—Higher Weight Efficiency, Lower Fuel Consumption and Easy Starting in Cold Weather Called For

By J. Edward Schipper

THIS is war time. Even though we are more than 3000 miles from the nearest battlefield, the fact that we are at war is carried home to us in practically every activity of our daily life. The war has its influence on our business regardless of what it is. It has its influence on our home life, and naturally it has its influence on our mode of transportation.

The business man of America depends upon his automobile for quick transit. In one or two of the largest cities of the country he is not permitted to use it to the extent that he should. The horse had such a long start on the automobile that our cities are still horse cities and not automobile cities, in spite of the fact that our municipalities have neglected to consider the question of the proper handling of automobiles during the business day. The parking problem is on the hands of every police department in the country, simply because the cities of America, and in fact cities of the world, are horse cities and not automobile cities. Nevertheless, the business man of America is using his automobile to such an extent that it has become a necessary part of his business life in spite of the fact that he is compelled to put up with inconveniences in the way of parking and storage during the business day.

Since the automobile is a part of the business life of every executive in the country, whether the business over which the executive has control is large or small, whether it concerns the welfare of an entire organization, or whether it only has to do with his own personal business, the war has touched his best means of transportation and is a vital factor in the matter of what the automobile user is demanding of the automobile manufacturer to-day.

War Consumes Metals

The war is like a gigantic metal whirlpool into which metals are drawn from all over the world to find their way into the guns and into the thousands of other war instruments which are necessary in the carrying out of a modern battle.

Many of these metals and many of the other materials used in the construction of motor cars are used at the front, and many of the other metals and other materials which are used in the automobile are necessary to the factory which is making munitions for the front, and so the question of materials becomes one of prime importance in the automobile of to-day.

This may seem like a matter which is entirely up to the car manufacturer, and yet it has as much to do with the consumer as with the maker of the car. In spite of the fact that cars are increasing in price almost from month to month, the demands of the user for performance are also increasing from month to month. While the average price of automobiles has gone up several hundred dollars, if we leave out of consideration for the moment the very lowest price cars, the average price that the user wants to pay has not gone up nearly as much as the price, and therefore we see performance, which was formerly expected only in the higher priced cars, demanded as a matter of course from cars which at the present time do not cost nearly as much.

No one knows better than the automobile manufacturer that the car buyer wants performance. The carbureter manufacturer is familiar with the same thing. He knows that the public is demanding that he produce an instrument which is capable of throttling to speeds hardly in excess of two miles an hour and upon application of the throttle of picking up rapidly and surely to speeds in excess of 50 m.p.h. on fuels which are forever going down in quality and volatibility. What does the average user demand? He wants a car that does not cost him too much, in the first place; he wants a car which will be tied up in the service station for the minimum amount of time. It is a matter of pride with every user that his car is dependable, and it is a matter of necessity with most users that the car will be able to perform more than 300 days a year without a falter. If we took an average of all the users in the country, we would probably find that there is a demand for 15 miles to the gallon of gasoline; that there is a demand for quick acceleration, good hill climbing, easy gear shifting, comfort in the seats and springs, accessibility for small adjustments and repairs, a minimum, or rather an absence of rattle, and when it comes to tires, anything short of 8000 miles is always occasion for a fit of peevishness.

Americans Want Acceleration

It is a certain fact that the American public demands the appearance of great size in its cars. The largest car selling for a given price will carry large sales, simply due to its size. Coupled with this demand for great size, the American public also demands acceleration. Size means weight and weight certainly operates against the quality of acceleration to such an extent that the torque requirements of the engine must be increased greatly to give the pick-up desired with the large car.

In Europe there are cars which, by a scientific use of the wheelbase, give all the necessary room at a greatly reduced weight, and consequently can supply all the acceleration demand with an engine of greatly decreased developed horsepower. The fact that the car weight is less allows the engine bearings and all other parts to be reduced accordingly and at the same time have factors of safety which are largely those used in average American practice, giving a greater endurance and a smaller service factor than can be expected from the large, heavy, high-powered design which engineers have been forced into much against their will.

Time for Economy and Efficiency

As mentioned at the beginning of this paper, this is war time. It is a time for economy and efficiency; therefore, let us appeal for a car design which is efficient and economical. It is exactly what the public wants, but owing to the education which we have given them through unhappily worded advertisements and by other means, the public believes that

*Presented before the Cleveland Section, S. A. E.

Digitized by Google

its demands are met in proportion with the size of the car. Tire economy and miles per gallon of gasoline and other desirable requirements have been sacrificed because it is believed that acceleration and comfort in riding can only be secured with the car of long wheelbase. As a matter of fact, careful design, coupled with compactness in engine units, will allow several inches to be taken from the wheelbase of the car without any sacrifice of room, without a great loss in riding comfort, if any loss exists at all, and at the same time with a gain in materials, a saving in weight, a saving in tires, a saving in gasoline, a saving in space required for parking, and a saving in every direction which can be thought of. It costs less to build a shorter car, and this money could either be taken from the price of the car, which would certainly be another factor in what the user is demanding, or it could be put in refining the design, with the result that probably even greater lightness would result and better upholstery, better painting, and better trimming could be applied which would tend to make the result a high-class car throughout.

Trend Toward Smaller Cars

For some reason or other, high priced cars in this country have nearly always been big cars, due to the necessity for catering to the taste for size, and yet the very trend of public demand shows that exactly what it wants can be met in a medium priced small size car which incorporates all the beauty of design to be found in the highest priced products, and all the excellent materials which are used in cars which to-day are only sold in long wheelbase.

Engine size has nothing to do with performance. Torque-weight ratio is the governing factor in acceleration and hill climbing, the two greatest demands made by car buyers in this country. The demand for reserve torque will probably exist for years to come, and the value of horsepower is something which has been greatly exaggerated by means of the literature of engine and car manufacturers. The words "high power" are fascinating to the layman's mind, and he has been led to believe that if he has a powerplant capable of a high maximum output under his hood, he has an engine which will enable him to run away from other cars with a powerplant not capable of developing such high output. This, of course, in the face of real analysis is untrue, because the high horsepower may not be reached until such a high number of revolutions per minute that the car speed would be prohibitive under ordinary gear ratio conditions.

All the performance desired in a five-passenger car can be secured with an engine under 200 cu. in. piston displacement. All the acceleration wanted and all the hill-climbing ability would be incorporated in such a car. The ration of engine torque to weight could be made very high in such a car at the speed at which such a ratio is most desired, and if an engineer were told to get out a five-passenger car in which all the performance demanded is incorporated, together with an economic use of materials and an economic maintenance factor maintained, he would be wrong to go much above the 200 cu. in. limit. The idea that a perfect-riding car is one of infinite weight should not be the goal.

Pounds Per Passenger Too High

Weight of car per pound of passenger weight is too high in America. The tendency toward long wheelbase and big engines is responsible. A five-passenger car should not weigh more than 3 lb. per pound of passenger weight if it is to be considered a truly economical design. With a designed load of 750 lb., a 2250-lb. car would be about right.

If this economy in material and maintenance were carried out there would be much less talk regarding material shortages, and this vital means of transportation would not be threatened to be put in the class of non-essential industries. It is impossible to picture the farming districts of America without automobiles. It would set the country back like nothing else in the realm of imagination.

This presents the picture from one side. We all know what the public demands because we know exactly what we like ourselves in a car. We like to step into a roomy, comfortable front compartment, into which we do not have to squeeze in order to seat ourselves behind the steering wheel. We are always pleased when our first glance tells us that the control members can be readily seen and readily reached. We want the engine to start almost on the first touch of the starting button; we like the starting pedal to engage with little effort, with the engine running smoothing and quietly; we want a clutch pedal which is depressed by very light touch of the foot and which when engaging gives a smooth pick-up without unnecessary slipping and without excessive grabbing. In shifting gears the clutch should release instantaneously and positively, so that there is no drag in the gears, and the gear lever itself should throw into mesh with a minimum movement and with a minimum amount of reach required to place the hand upon the shifter cane. In picking up, the operator should be able to depress the throttle almost as quickly as possible without creating undesirable conditions of knocking, choking, spitting back, or laboring of the engine. In other words, carburetion, gear reduction and engine capacity and torque output should be so attuned that a smooth accelerative ability is given. Here, of course, lightness again enters.

The Cold-Starting Problem

Winter is now upon us, and to the list of requirements given above must be added that of starting rapidly on a cold morning. This is the most pertinent point of all at the present time.

All the hot spot intakes and exhaust jacketed carbureters in the world will not do one thing toward making the car easier to start. The carbureter manufacturers have provided us with very efficient chokes; even at the speed attained by the average starting motor on a cold morning these chokes are capable of shooting into the cylinders a supply of raw gasoline which would go a long ways in operating a dry cleaning establishment. Sometimes some of this raw liquid is ignited during the first three or four minutes of cranking, but quite often the motorist helps the situation along by distributing ½ pint more of gasoline between the four, six, eight or twelve cylinders. This joins the supply which the efficient choke has put into the combustion space, and ignition starts only, however, after a liberal supply of the raw fuel has leaked its way past the piston rings and gone down into the crankcase to help form what is sometimes called "crankcase soup."

Oil Dilution Serious Matter

If the car starts in 30 seconds the user is fairly well satisfied. He does not think, however, of all the gasoline that can be drawn into the cylinders and leak past the piston rings in the space of 30 seconds, he does not consider the fact that his lubricating film has been destroyed to a large extent by this gasoline, and he does not stop to consider how much the supply of lubricant in the crankcase has been deteriorated due to dilution of the oil by the heavier constituents of the gasoline.

This situation is probably the most serious one which confronts the designer to-day. The automobile user is demanding service, and he will not get good service from an engine which is being treated in this manner. The first few minutes of running with an engine in this condition are working considerable damage to that powerplant, and the problem must be met quickly or else a great amount of damage is going to be done during this winter to cars which are kept in unheated garages. The unheated garage is by far in the majority, it must also be remembered.

In these days when high prices of labor and material are forcing the price of cars upward, something must be done to meet the cold starting situation. A heating coil in the float chamber, or some other gasoline chamber, a water heating system connected with the radiator, or some other method which is equally effective, must protect the owner from the consequences of crankcase dilution. The average owner is wise enough to know that it is requiring a pint or more of gasoline for him to get his engine warmed up on a cold morning. He knows that he is not burning this pint of gasoline and all of it is not going out of the exhaust; therefore, the remainder forces its way into the crankcase, and cars

Digitized by Google

which are fitted to combat this trouble are going to have a strong selling argument and are going to go a long ways toward meeting one of the biggest demands made by car users on the car manufacturer.

Preheating the Air

The heated intake has been studied so carefully by all manufacturers that it is useless to dwell upon it. Only one suggestion should be made, and that is that there are a great many manifolds which are erring on the side of too much heat rather than too little. It is practically impossible to meet the extreme ranges of temperature conditions, which range amounts to 100 degrees, or more in most of the cities along our temperate belt without some sort of adjustment. The air is always preheated to some extent and probably the means of adjustment to meet the outside temperature conditions is most rapidly effected by varying the amount of heat which is imparted to the initial air before it enters the carbureter. Too much heat makes the engine unsatisfactory, due of course to its reduction in volumetric efficiency, but the proper amount of heat, in spite of the expansion of the intake gases, will often result in an improved torque curve.

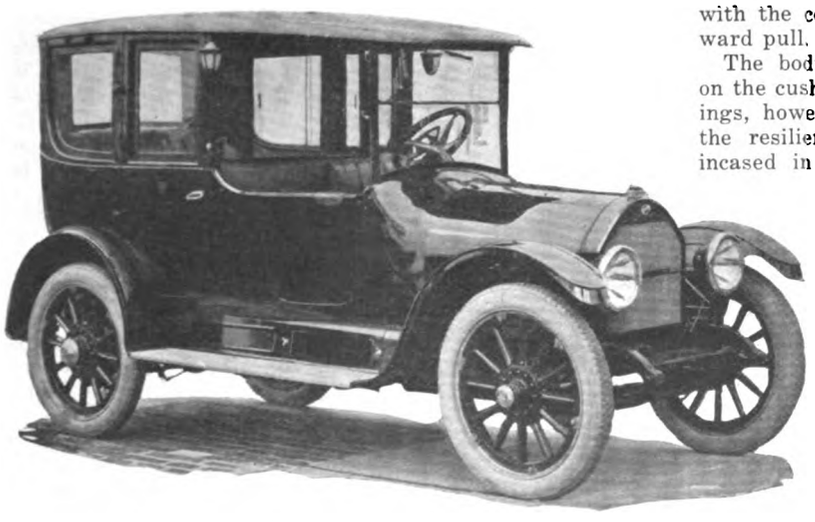
Economy Demanded

There is no Herbert Hoover controlling the gasoline situation in this country, but it might be due to his influence that the habits of economy are being instilled into the minds of the Americans more than ever before. It is a noticeable fact that this year's car users are demanding gasoline economy more than ever, and vigorous activitities can be noted on the part of carbureter manufacturers to supply this demand.

The carbureter, however, is not the only factor in economy. Lightness, which has always been important from a performance standpoint as well as that of economy, is a paramount necessity. Lightness does not only mean the reduction of weight by scientific design of parts, but it is possible to gain a far greater amount of weight by a scientific use of wheelbase length. In this country we have been wasteful of wheelbase. We have secured a minimum of passenger space with a maximum length of car. It has been possible in Europe, due to the use of shorter engines, shorter hoods and the more scientific location of parts, to get much more room on a given length of car, with the result that the car weight per passenger has been very much reduced. Scientific designing from one end to the other would make possible a great economy in materials and yet a very little sacrifice in performance; in fact, there need be no sacrifice but an actual gain in the way the car operates.

Silence and Appearance

The rear axle gears and in fact the entire transmission mechanism should be quiet and sturdy, the propeller shaft should not whip, and none of the parts beneath the chassis should be so filled with grease cups that the user of the car is fortunate, indeed, if he finds 25 per cent of them on his first greasy search beneath the chassis.



The appearance of the car should please the eye. Exterior appearance is a matter of choice, and like a great many things which are changed from season to season, it is impossible to lay down any rule as to what they should be like. Present-day style calls for long, straight lines without sharp breaks from radiator cap to the end of the tonneau. Another year this might be different. Nevertheless, the car should conform to the dictates of the moment. The upholstery should be good, and here it may be said that some of the latest of imitation leathers are rendering excellent service and are doing better in fact than poorer grades of genuine leather.

Buying Public the Arbiter

The top should be so designed that it is quickly put in place, and the side curtains should permit of ready view on all sides of the car. Some of the side curtains, with their small lights, shutting off the view of the driver, are a positive menace in city driving rather than an advantage. The windshield should be drip-proof and have the ventilating feature which has come to be demanded by everyone. The public is demanding a good car and an economical car, and the engineer must supply by scientific design what the public demands in the face of the fact that he is now under limitations of material which did not hinder him a year ago. The public demands are the ultimate factor in the sales of the car, and the closer that engineering design dovetails with the demands of the public and at the same time coincides with what is really scientific and efficient from an engineering standpoint, the better the ultimate car will be.

Willys Produces Knight-Engined Taxicabs

THE Willys-Overland, Inc., Toledo, has recently concentrated on the manufacture of a Willys-Knight chassis equipped with a special taxicab body. This car is being used to some extent in both New York and Chicago. The rear seat will comfortably carry three passengers, and two others may be seated on the folding auxiliary seats. The latter are deeply upholstered and attached to the partition between the front and rear compartments by means of sliding bars and channels. When not in use these seats fold back flush with the compartment and may be released by a slight upward pull.

Willys-Knight taxicab

The body is upholstered in Spanish leather, hand-buffed on the cushions, backs and sides. The panels, doors, and ceilings, however, are machine-buffed, and all cushions are of the resilient spring type, comprising many small springs incased in a canvas container. The additional equipment of the rear compartment comprises silk roller shades and a soft thick carpet, as is in line with the practice on high-priced private cars. A speaking tube, black enamel card case, aluminum pins for holding taxicab literature, and a compartment ventilator complete the equipment.

The standard finish of the taxicab body is rich dark blue, the wheels being painted to match, though, if desired, other colors are furnished. The fenders and trimmings are in black enamel, and the fittings are nickel and polished aluminum.

A feature of the cab is its roominess, which will make a special appeal to travelers carrying grips, etc., with them.

First Class AA ¾-Ton Military Trucks Practically Ready

To Be Purchased in Great Numbers and Used in Many Departments, Including the Post Office

THE first four experimental models of the Class AA ¾-ton trucks are practically complete. Designed under the supervision of the Quartermaster's Corps, they are destined to play perhaps the greatest part in all the work of our standardized war vehicles for the reason that they will be purchased in great numbers, and will probably be used not only by the Q. M. Corps but also for the Navy Department, Marine, Signal and Medical Corps, and also for the Post Office Department.

All these departments were considered in the design of the vehicle, which in so far as possible include provisions for the particular class of work which must be performed by each of the departments.

Although the Quartermaster Corps will use a large number of the trucks as soon as they have passed through the preliminary road test, it is expected that the Medical Corps will require at least 3500 for immediate service as ambulances. It is likely several thousand will be purchased during this year and put into service over the 4000 miles of new parcel-post routes just laid out from Maine to Louisiana by the Post Office Department.

The fact that the chassis will serve as an ambulance perhaps affected its design to a greater extent than any other consideration. It was because of the fact that they will be used as ambulances that the vehicle was provided with a torque arm and radius rods notwithstanding the fact that the heavier Class A and Class B trucks both employ Hotchkiss final drive in which the torque and propulsion are taken through the rear springs.

Easy Riding a Prime Requisite

For ambulance work easy riding qualities are one of the prime requisites, and it was considered advisable in this service to make the springs carry only the body and the live load instead of both the driving and propulsive strains. The use of the radius rods and torque arm make for a slightly heavier and more costly construction, but when the lives of our men are in the balance these two elements are secondary in consideration. These details have not been finally settled.

As previously told, the trucks were assembled by the Reo Motor Car Co., Lansing; Federal Motor Truck Co., Detroit; Maxwell Motor Co., Detroit; and the Willys-Overland Co., Toledo. The fifth truck, which will be assembled later in Washington, as a check against the design, has not yet been started.

The progress of the work at the four plants was about the same. The vehicles were originally scheduled to be completed on Jan. 15, but this was not possible on account of various unavoidable delays.

The Federal and Reo companies received their orders from the Government to begin the construction of their trucks Dec. 19, 1917, while the Willys-Overland Co. received its order on Dec. 24. The Maxwell company was the last to get its word to go ahead, receiving its order on Jan. 7.

The Federal company received the engine, springs, frame and clutch on Jan. 2, and immediately began to assemble the various component parts. With the exception of the front and rear axles its job was virtually completed on Jan. 8. The Reo company went to work on much the same schedule and completed its truck as far as possible, at the same time.

The Willys-Overland company received its engine from the Northway Motor Corp. on Jan. 3, together with the frame parts from the Reo company and the clutch assembly from the Detroit Gear & Machine Co. The steering assembly arrived on the day following and the Willard storage battery and muffler on Jan. 8. The wood wheels, transmission and radiator, the latter from the Federal Motor Truck Co., were received on Jan. 10. The starting motor, fenders, hood, tool box and universal joints arrived on Jan. 11, and the dash, instrument board and fittings on Jan. 15. Actual assembly was begun on Jan. 16, and was finished as far as possible on Jan. 24, with the exception of the front and rear axles.

The Maxwell company started the assembly of its job on Jan. 11, the date on which the frame arrived, and finished the vehicle on Jan. 24, with the exception of both sets of axles. The delay in the delivery of the axles was because they required much new die work.

All of the principal component parts entering into the construction of the vehicle were ordered from the parts makers by the Government, which was therefore responsible for the arrival of the parts at the assembly plants at the scheduled time. All of the parts, with the exception of the front and rear axle, arrived in time to complete the job on schedule.

The mechanical features of the truck have already been explained in detail in these columns. It will be noticed that the engine is provided with detachable cylinder heads and with the dual-ignition system consisting of both a magneto and generator as followed on both the previous Class A and Class B trucks. It differs from both of the latter in that it is equipped with an electric starter. It has, however, many of the characteristics of the Class A and B engines, including the hot-spot manifold and a similar mounting of the distributor, water pump and magneto on the left side of the engine looking toward the front and the governor and generator on the right side.

Another unusual feature of the engine is that the crankcase is so designed that cylinders of 3¾-in. bore by 5-in. stroke are interchangeable with the 4-by-5-in. cylinders now fitted. The purpose of this construction

Standardizing Balance

By N. W. Akimoff

A NEW sort of technical standard is being proposed by the author, that of balance, both static and dynamic. It will take several years to put through an idea of this sort, but by constantly pounding at people's common sense it is felt that this can eventually be done.

In five or six years a prospective purchaser will begin to demand that certified proof is produced to the effect that the initial unbalance in the car he wants to buy is *not over so much*, in pretty much the same way as he now buys sugar by the pound and gasoline by the gallon, instead of by the handful or bucketful, respectively.

Incidentally, no one ever bought a pound of sugar or a gallon of gas; the very conception of an exact pound or gallon would lead to complications that would discourage the buyer and would cost him much more than the goods themselves.

All the buyer knows, all he cares to know, is that the weight of a given quantity of sugar is approximately the same as the weight of an adopted standard, determined on a rational device that is not supposed to be out TOO MUCH; in other words, that the possible error is surely not more than so-and-so.

Now, since balance can actually be weighed, not necessarily in pounds but nevertheless in definite, rational units, why not insist on certain tolerances, outside of which we have unbalance, and inside of which balance is good, or at any rate practically acceptable?

For static balance the unit is *ounce-inches*, and the limit proposed by the author for a body not exceeding 150 lb. in weight and whose journals are not over 3 in. in diameter should be 0.4 oz.-in.

For dynamic balance, which really is due to the absence, or in general to the action, of a centrifugal couple, the logical unit is not the measure of a couple, say in foot-pounds or in ounce-inches, but a new unit, proposed by the author some time ago, *inch-ounce-inches*, or *ounce-inches square*. The advantage of this unit is that it brings out the very essence of the centrifugal couple, *minus the speed element*, which for our purpose is absolutely immaterial.

Now, for a body of the character outlined above the allowable dynamic unbalance is, according to the author's suggestion, not to exceed 12 oz.-in. sq.

The author has established these limits from numerous observations in his laboratory and feels that they are practically permissible, not inconsistent with the requirements of good production, yet capable of satisfactory results in operation.

Two main classes of manufacturers will bitterly oppose the introduction of such standards, not realizing that progress cannot be choked: 1. The man who feels that there is *nothing in it*. Our fathers made money without any balance at all, and why should not we? etc. 2. The man who believes that one degree of balance is exactly as good as another; that all balancing machines are alike, and the cheapest is possibly the best after all, regardless of the principle on which it works; also his twin-brother, the man who believes that he can build a *machine of his own*, just as if this were as easy as rolling a cigarette. This latter class of engineers is highly amusing and entertaining: they get the appropriation and just go to it!

The author has seen tens of thousands of dollars' worth of such machinery of "own" make thrown into a huge scrap pile, although in a few isolated cases the designers still stick to their creations with an ardor that would make Pygmalion himself fairly sick; all this at the dear public's expense.

Now there is an easy manner in which this chaotic condition can be remedied; here is a criterion that ought to be safe, and at the same time fair to everyone:

1. All machines which comply with what follows are balancing machines; those which do not comply cannot be advertised by that name or sold for purposes of balancing (think of a scale or a set of weights or of a 5-gal. measure that would not answer similar conditions).

2. A steel rod, ground perfectly straight, of about 2 in. diameter and 3 to 4 ft. long, when placed in the balancing machine and operated at 300 to 400 r.p.m. should exhibit no vibration.

3. Static unbalance of not over 0.4 in.-oz., caused by such means as suitably fastening a small weight to the periphery of the above-mentioned rod, should be clearly indicated by the machine at speeds not exceeding 300 r.p.m.

4. Dynamic unbalance of not over 12 oz.-in. sq., caused by such means as fastening two small weights to the periphery of the rod, at opposite sides and at proper longitudinal distance from each other, should clearly register on the machine at speeds not exceeding 300 r.p.m.

5. In actual balancing the amplitude of oscillations of the indicator will not exceed that secured under tests 3 and 4 respectively.

Under this plan no real balancing machine can be excluded from the field and no fake appliance can receive much encouragement; of course, people will get up new balancing machines right along, since it is not possible to restrict the art itself by patents or otherwise, but only separate, individual designs. But any such machines must clearly show that they can do the work.

Let the manufacturer prepare himself to the new situation, demand for standardized balance.

Overhanging Propeller Shafts

By H. R. Trotter*

THE writer's attention has been called to Mr. C. J. Schipplock's criticisms of the Howard Aero Engine in your issue of Dec. 6.

The use of an overhung pinion construction is not prohibitive, provided due care is taken in the design and selection of materials used.

It can be taken for granted that all shafts deflect and that deflection takes place even though the shaft be unloaded. This deflection also is accentuated with an increase in speed and cannot be prevented by the use of a so-called rigid type of ball bearing. The employment of this type of bearing simply results in the overloading of a few of the balls and a rapid increase in friction loss with consequent wear.

With the employment of a self-aligning type of bearing, these disagreeable features are entirely eliminated and the bearing capacity remains the same, independent of any position which the shaft may assume. The greatest advantage, however, obtained by the use of the self-aligning bearing is that there is no danger from excessive shaft stresses. Furthermore, there is no possibility of the bearings being unduly loaded beyond their capacity by inaccurate machining, as is very often the case with the rigid type of ball bearing.

When plain sleeve type bearings are used, inaccurate machine work is easily detected because of the fact that if the bearings are out of line, the shaft binds and in some cases will not rotate.

It is a well-known fact that the friction loss of a ball bearing remains practically constant, despite the increase of load. It is, therefore, possible to bind a rigid type of ball bearing and thus heavily overload the balls without any evidence of this overload being apparent.

A shaft running under this condition is also subjected to very severe reversal of stresses. These stresses constitute a danger which is always present if a self-aligning bearing is not used.

Chassis Design of the Class B Truck*

A Chronology of Events Leading Up to the Work—Changes from Original Specifications—Reasons Behind Pressed Steel Frame and Hotchkiss Drive—Engine and Gear Box Mounting and Chassis Lubrication

By Cornelius T. Myers

IF there is an accomplishment any more representative of the spirit and constant endeavor of the S. A. E. than the design and building of the first class B Military Motor Truck it does not appear on our horizon at this moment. It represents one culmination of the ideals for which the Society has labored unceasingly, and that it is to be of service to our country at this time is a reward that few of us expected.

In touching on the chassis design the writer will put down just a little of the chronology of events leading up to the starting of the work, and will then touch upon a few fundamentals, following with notes as to details.

Chronology of the Truck's Design

On June 27th, 1917 (the day after the close of the semi-annual meeting of the S. A. E. at Washington), a large number of engineers representing truck builders and component parts makers met in Washington to discuss with Captain Britton, of the Quartermaster General's office, a military motor truck composed of standardized parts. These men divided up into groups, representing engines, axles, transmissions, chassis, etc., and after some discussion it was decided that the job could be done. A tentative layout for the Class A chassis was discussed. A layout for the Class A truck using the parts suggested by the parts makers groups was made and submitted at the next meeting, which was held July 9 and 10 in Columbus. The layout was discussed and a few changes recommended, which were incorporated and submitted July 20 and 21 for the second Columbus meeting. A layout of the Class B chassis was made and quite fully discussed. The Quartermaster General's office then took over the work, having decided that a truck standardized in all its parts should be designed. A number of the engineers who had been working on the chassis and parts designs were asked to go to Washington and complete the design under the supervision of the Quartermaster General's office. On July 30 these engineers reported in Washington ready to continue the work.

On August 27 the Schedule Committee on Design was organized and divided the work among parts groups, setting September 10 as the day on which the design should be completed. Between July 30 and August 27 much preliminary work was done by the parts-builders groups but no progress could be made with the chassis design, as there were differences of opinion among the members of almost every group of parts designers.

The parts designs were finished on September 10 and within a few days the chassis designs were so far toward completion that arrangements were made to produce two sample trucks. These were completed in an unbelievably short time, and their satisfactory performance began when the paint on the chassis was hardly dry. Driven from Rochester, N. Y., and Lima, Ohio, they arrived in Washington on October 14 and were presented to Gen. Chauncy B. Baker and by him to Secretary of War Newton D. Baker on October 19, which will always be held a red-letter day in the annals of the Society.

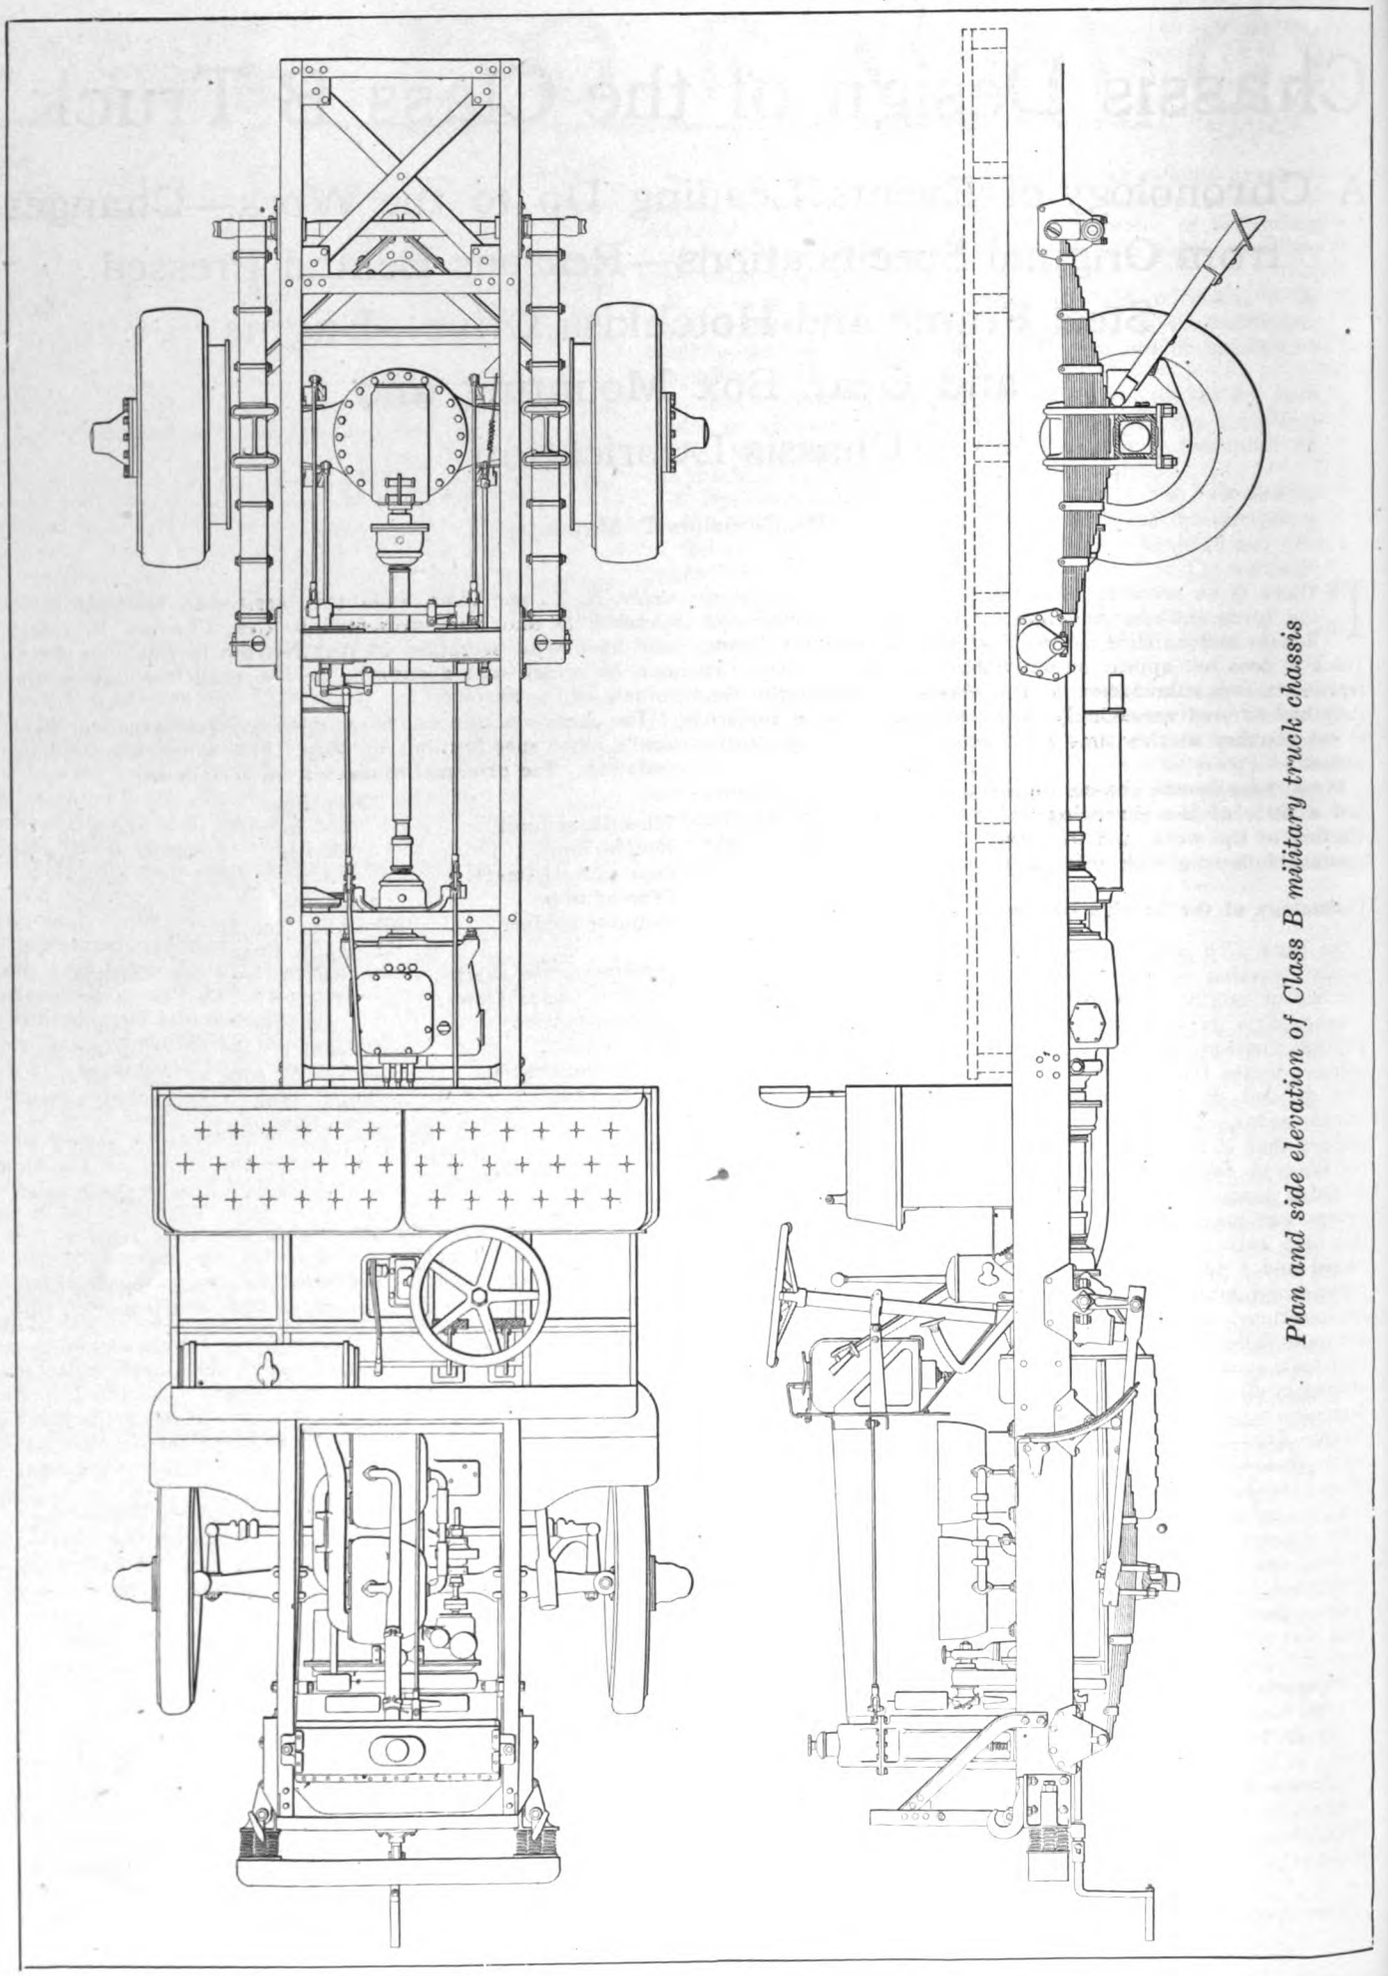
The chassis design was based upon the Quartermaster General's office specifications of May, 1917, which were closely followed. The principal changes were as follows:

	May Spec.	Actually
Wheel-base limit,	156 in.	160½ in.
Weight limit,	8000 lb.	8800 lb. (aprx.)
Rear tires, diameter,	36 in.	40 in.
Type of tires,	demountable	pressed-on
Radiator surface,	305-sq. in. frontal 322-sq. in. total	
Tractive factor (high),	0.0775	0.063
Tractive factor (low),	0.338	0.307
Ignition system,	dual	double
Differential,	locking	free acting
Chassis lubrication,	grease or oil cups	mag. oil feed
Gasoline tank,	30-gal. tank 6-gal. reserve	2 16-gal. tanks
Sprags,		added
Pennant stops for springs,		omitted

The following were the guiding factors in designing the Class B chassis; they are set down in the order in which they were given weight. (This tabulation was not official but was observed by the writer, acting as chief draftsman on this work, and it was generally followed):

(1) Reliability.
(2) Accessibility.
(3) Weight.
(4) Simplicity and ease of manufacture.
(5) Operating economy.
(6) First cost.

The item of efficiency was more particularly studied and cared for by the parts design groups. Wherever the location or suspension of a part had an important bearing on efficiency it was considered as having greater importance than the second item.



Possibly as good a way as any to describe the chassis design is to take up the units which enter into its construction, beginning with:

Frame Construction

The frame is of open-hearth steel pressed into shape. The side rails are channel section with parallel flanges which are tapered at the front to reduce weight and give greater room for the radiator. There is a heavy pressed steel cross-member in front of the radiator, one between the front brackets of the rear springs, and one at the rear. A lighter pressed steel cross-member supports the rear of the gear-box, while a

*Paper read at the S. A. E. Winter Meeting.

Plan and side elevation of Class B military truck chassis

Digitized by Google

forged cross-member supports the front of the gear-box and the point of the engine. The frame is designed to be as flexible as possible without in any way being flimsy or likely to buckle.

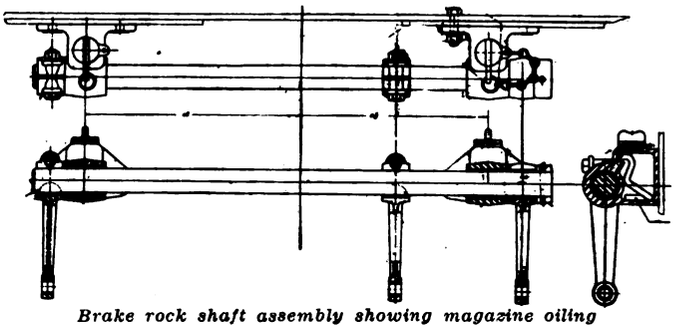
The pressed steel frame allowed better distribution of metal than a rolled section, its uniform thickness is of advantage in rivetting—there is better assurance of uniformity of metal, and the rounded portion where the flanges meet the web allow large fillets or brackets. The frame is a bit narrower than usual, 34 in. to outside edges, in order to allow a maximum turning angle for the front wheels and to save weight in cross-members and support brackets.

The springs are designed to be nearly flat under rated load. The axles are fastened to the middle of both front and rear springs. This permits the assembling of the front springs without fear of damaging the steering-gear linkage, as might take place if the front axle were not in the middle of the springs and the long end of the spring on a repair job was put where the short end should be. The spring seats are also reversible and the steering pivots are given a castor action by inclining the whole front spring. This also enabled us to get a good location for the ball on the axle steering arm and to insure a minimum of stress on the steering-gear and drag link due to axle motion.

Hotchkiss Drive Adopted

The rear springs form the driving connection between the rear axle and the frame a la Hotchkiss. The discussion at Columbus previous to the decision to adopt this type of drive was illuminating, and after all was said the only argument against it was its tendency to throw the rear-wheel brakes out of adjustment if the brake connections were not correctly designed or when the spring under load had a considerable amount of camber. To the writer's mind, however, one other point should be given careful attention with Hotchkiss drive —the slip-joint in the drive-shaft at the forward universal joint. Unless the slip-joint is carefully made, thoroughly protected from dirt and properly lubricated, the motion there will result in a serious end-thrust being developed on the universal-joint and the bearings behind it.

By placing the steering-gear behind the rear engine support-arm a long straight drag link was secured. The gear is held by a capped minion-bracket and can be readily removed without disturbing the engine or controls. One of the bolts in the gearcase extends through a lug on the bracket and thus relieves the column of any bending strains. The column is firmly braced to the dash. The steering-gear case is located so that the clutch can be removed without disturbing the gearcase. The cap for the gearcase carries a lug that supports the clutch and brake pedals and makes a very clean bit of design at this point where, on the average truck, lifting the floor boards reveals an entanglement of brackets, shafts and nuts that are impossible to adjust without a wrist like a flamingo's neck.



The tires specified were 36 by 5-in. single front and dual rear or 36 by 10-in. single rear. They were to be of the demountable type. After much discussion the change was made to the pressed-on type, saving some 400 lb. in weight and affirming the almost unanimous opinion of the engineers on the job and the tire makers that it was the better type. The evidence from across the water, also, was strongly in favor of the pressed-on type.

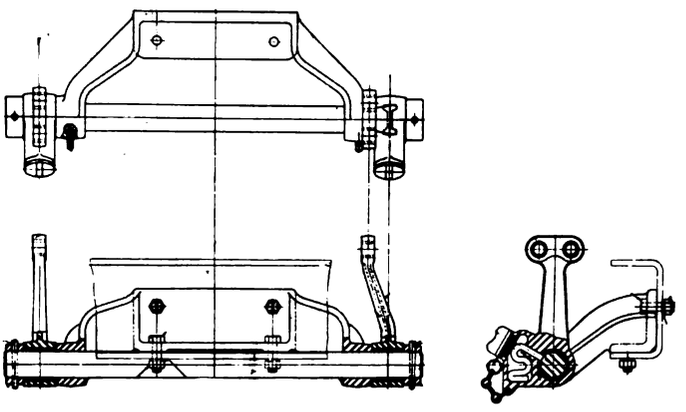
The 36-in. rear tires were changed to 40-in., which gave 2 in. more clearance under the rear axle, better adhesion, better rolling on bad ground, lower gasoline consumption, more tire mileage, and an 11 per cent increase in the truck speed for a given engine speed.

Mounting of Units

The wheelbase, named as 124-in. minimum and 156-in. maximum in the Quartermaster General's office specifications, was increased to be 160½ in. This was deemed advisable in order to keep the proportion of live load on the rear axle below 90 per cent, and at the same time have ample seat-width and a sufficient space between the seat and the steering column.

The mounting of the units in the frame was carefully considered from the following standpoints:

Brake rock shaft assembly showing magazine oiling



(1) Frame flexure.
(2) Accessibility.
(3) Independent assembling and demounting.
(4) Simplicity.

The radiator has two feet which rest on soft pads on each frame rail. The single holding-down bolt in each foot passes through a clearance hole in the rail and a coil spring between the foot and the nut allows the radiator to take its easiest position when the frame distorts. A rod from the flange of the top tank of the radiator is in an approximately vertical position.

The engine also has a three-point mounting. The two rear lugs on the flywheel housing rest in pressed steel pocket brackets rivetted to the frame rails. A vertical bolt passed through each lug bracket, and a heavy spiral spring between the bottom of the bracket and the nut. The bracket is so formed that the engine lug will be held in place even if the bolt is lost. It is lined, so as not to chafe the aluminum lug. The third "point" of the engine support is a cylindrical surface on the timing gear cover around the nose of the crankshaft. This swivels in a forged cross-member which is bolted to brackets on the frame rails. This construction is light, substantial and is easy to dismount when necessary. An odd feature is that the boss leading from the bottom of the radiator to the pump on the engine is jointed by a piece which is fastened to and passes through this cross-member. The clutch is housed in with the flywheel and the gearshift is mounted on the clutch housing. The hand-brake hand-lever is mounted on the side of the gearshift housing and is (to the author's mind) an objectionable feature as it subjects light aluminum castings and the stud threads in them to the heavy pull in the brake-rod. This pull can be severe when the rear springs flex violently, for the rachet on the hand-lever is non-yielding and there is bound to be some relative longitudinal motion between the rear axle and the brake rocker-shaft.

Gearbox Has Three-Point Support

The gear-box suspension is three-point. At the rear of the box two forgings bolted to it carry lugs for horizontal transverse pins which are carried by vertical clevis bolts in a pressed steel cross-member of the frame. The third "point" of suspension is in a forging around the nose on the front of the gearcase. This forging is held in brackets rivetted to the frame. The center-line of the main shaft in the gear-box is

Magazine oiling of floating brake levers

Digitized by Google

a little lower than that of the engine. This gives a slight angularity to the front propellor-shaft and also some motion to the universal-joint trunnions; it also drops the gear-box cover below the top of the frame and gives more nearly a straight-line drive from the gear-box to the rear axle.

The design of the dash in connection with the gasoline system, which was considerable of a problem, was solved by locating half the supply of gasoline in a tank on the dash and the rest in a reserve tank under the seat. When this was first suggested a hand air-pump was to be provided, as was also a pipe from the reserve tank to the top of the service tank so that the reserve supply could be readily transferred. At present, however, the transfer is accomplished by means of a bucket or can.

In the chassis lubrication of both Class A and Class B chassis, as originally laid out, it was also planned to use oil at almost every point—grease to be used only in the wheel hubs and in the universal-joints. When in Washington last week the writer learned that this was not being carried out on the Class B chassis at some points where it could readily be done. On the Class B all the spring bolts, shackle pins and brake rocker-shafts are oil-lubricated by the "magazine system." Wicks convey oil by capillary attraction from pockets of considerable size in the bracket castings to the bearing surfaces. The pockets need to be filled but once a month. Dirt is not fed to the bearing surfaces even if the oil is dirty. The oil feeds only when the truck is in motion. Seepage from the spring bolts follows down the leaves of the springs and keeps them from rusting.

The front and axle-steering pins are designed in the same way and the steering connections are designed for small wick oilers. Grease cups have been put on the drag link to lubricate the steering balls, on the starting crank, on the brake spindle of the rear axle and at other points.

Paragraph 30 of the Quartermaster General's office specifications lays particular stress on the "tractive factor" of the truck as a measure of its ability for negotiating heavy grades and bad roads. The formula for "tractive factor" is as follows:

$$T\,F = \frac{8.4\ n\ b^2 s}{D\ W} \times \frac{R}{} \times E_m \times E_t$$

n—number of cylinders in engine.
b—cylinder bore, inches.
s—stroke of cylinder, inches.
R—gear reduction between engine and driving wheels.
D—diameter of driving wheels, inches.
W—total weight moved, pounds.

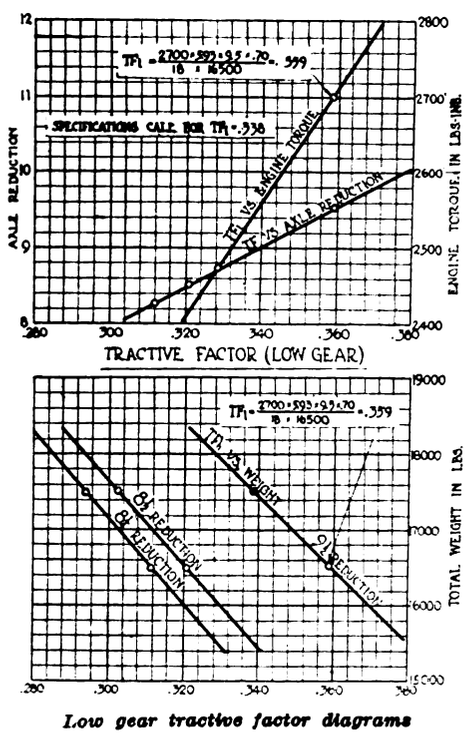
E_m—efficiency of engine compared with A. L. A. M. (now N. A. C. C.) rating as unity.

E_t—efficiency of transmission system from engine to road. Since 8.4 n b^2 s E_m represents engine torque in inch-pounds the formula can be written

$$T\,F = \frac{\text{torque} \times R \times E_t}{0.5\ D\ W}$$

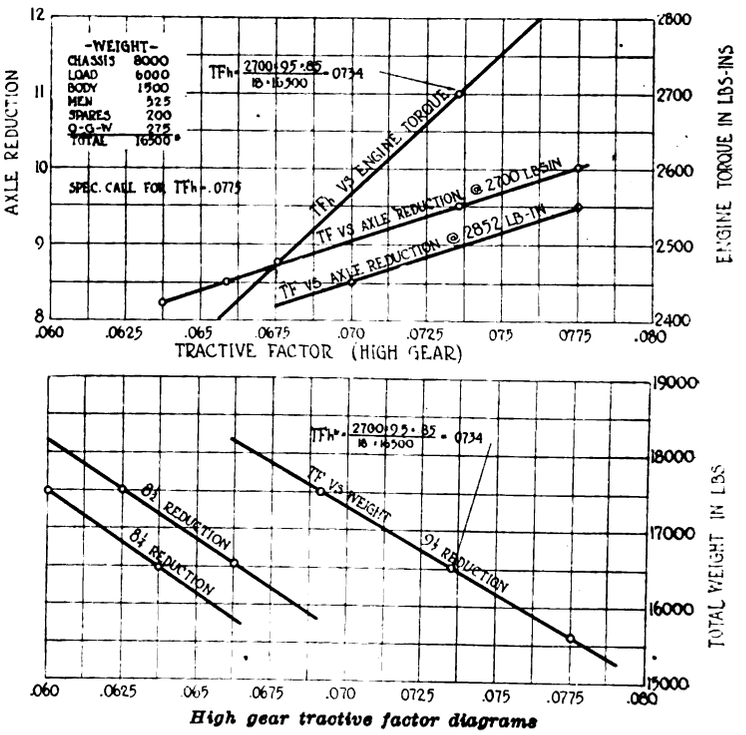
It was predicted that the 4¾ by 6-in. four-cylinder engine would develop not less than 2700 in.-lb. average torque between 600 and 1000 r.p.m. The worm-gear reduction is 9.5; one-half the wheel diameter given in the specifications is 18-in.; the transmission efficiency given in the specifications is 85 per cent; the total weight moved is about 16500 lb. From these figures (on high gear)

$$T\,F_h = \frac{2700 \times 9.5 \times 0.85}{18 \times 16500} = 0.0734$$



The low gear reduction in the gear-box itself is 5.93 and the specifications call for a transmission efficiency of 70 per cent. Whence (for low gear)

$$T\,F_l = \frac{2700 \times 5.93 \times 9.5 \times 0.70}{18 \times 16500} = 0.359$$



Deducting a road coefficient of 0.0175 as the rolling resistance over hard roads, these figures indicate that the loaded truck should take a 5½ per cent grade on high gear and a 34 per cent on low gear.

To get the "tractive factor" called for in the specifications (0.0775) with the reduction of 9.5 adopted, the engine would have to deliver a torque of 2852 in.-lb. On test the first engines developed in the neighborhood of 3000 in.-lb. torque. It is safe, therefore, to count on 2700 in.-lb. as a production standard.

As a commercial possibility the Class B chassis may be questioned on the score of speed, load rating and gasoline economy. Slight modifications, however, should make it the best 5-ton chassis that rolls. There are some details that are not yet fully developed for the service for which this chassis is intended, but these will undoubtedly be cared for and perfected. There is so much good design in the component parts and in the chassis itself that in many ways it will be a criterion for some time to come. To the author's mind, an English officer, after having examined the sample trucks and questioned some of our engineers regarding them, summed up the matter well when standing back and viewing one of them critically, he exclaimed, "Well, she looks a job; she looks a job."

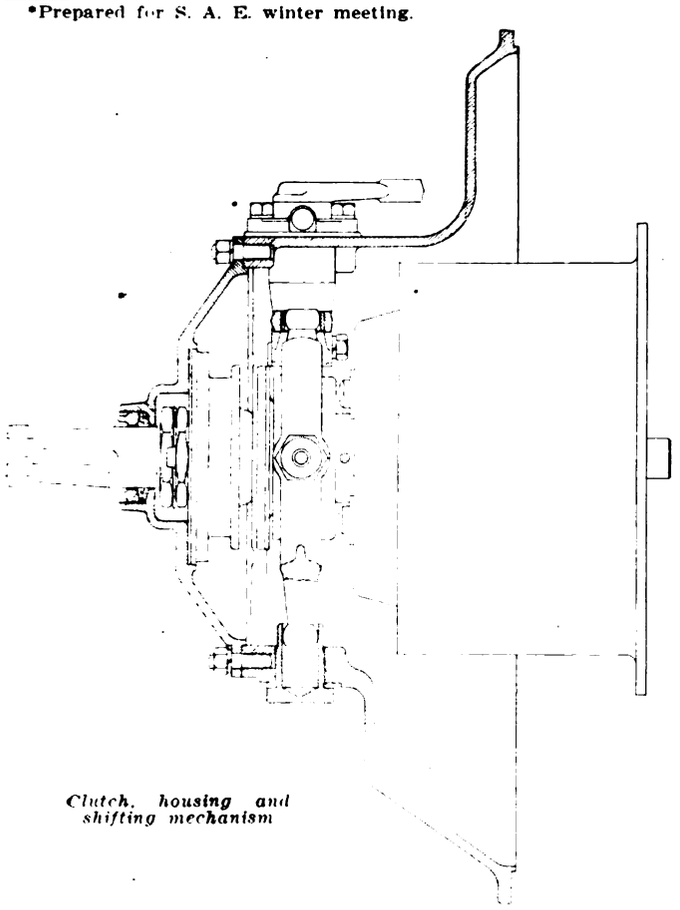
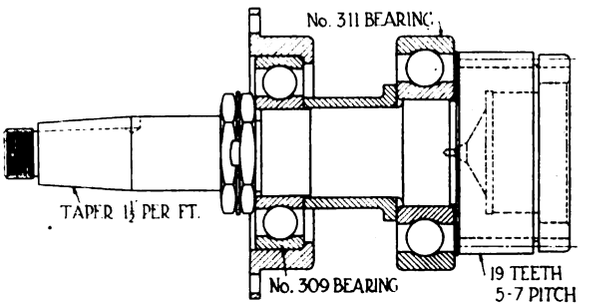
Transmissions for the U. S. Class B War Truck*

Sequence of Events in the Design of the Transmission—Frankness Marked Discussion of Features—Specifications of the Gear Designed



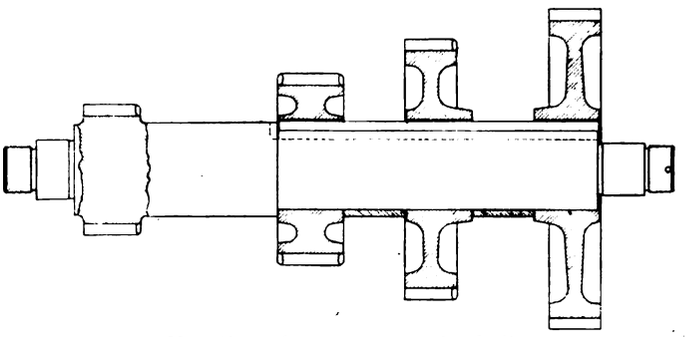
By A. W. Copland
President, Detroit Gear & Machine Company

THE first meeting of the newly formed Transmission Division of the S. A. E. Standards Committee was held May 2 and 3, 1917, in Cleveland. Some two weeks before this time the Motor Transport Board of the War Department had issued standard specifications for Class A and Class B gasoline motor trucks in the preparation of which the Truck Division of the S. A. E. Standards Committee assisted.



The first business taken up by the new Division was a study of the standard specifications as they directly or indirectly influenced the transmission and clutch design. Some minor changes in the specifications relating to transmissions and clutches were suggested. These were accepted by the Government and incorporated in the later edition of the specifications.

At this time the plan was to accept any commercial engine, transmission, and axle that would come within the specifications and use them in trucks that would measure up to the requirements. However, the design of the fastening points and connections for each major unit was to be standardized so that each unit would be interchangeable with any other unit of its class. The Transmission Division took up this work with great earnestness and held several meetings during May and June.



*Prepared for S. A. E. winter meeting.

Clutch, housing and shifting mechanism

Support of constant mesh pinion

Mounting of gears on countershaft

Nearly every transmission maker in the country submitted at least one design and some manufacturers presented a new design at every meeting. It was found necessary to make changes in the fastening points of every transmission then in production which was submitted for consideration; in most cases the gears and countershaft were the only parts not changed. One maker insisted on having the size of holes in the rear supporting-arms of his transmission made the standard, declaring it was the only thing on the outside of his design that had been left to him. Real constructive work was accomplished by the free discussion and friendly criticism of each other's designs.

The following incident will illustrate the practical value of these frank discussions: Mr. A. remarks: We have never had an entirely satisfactory thrust bearing and throwout device for our clutches; we attempt to lubricate the thrust bearing by delivering oil from the transmission through a passage in the shank of the drive-gear. This passage was connected by radial holes with the thrust bearing. If we make these holes large enough to insure sufficient lubrication at all times, occasionally the flow will be so excessive as to drain the transmission. We have tried a felt damper in the drive-gear but this has proved only partly successful because so many different kinds of transmission lubricant are used. Now, I have noticed that Mr. B. does not provide any means for lubricating the thrust bearing, but uses a type of thrust bearing quite different from ours. As he has been using this bearing for a long time we have decided to adopt Mr. B.'s type of thrust bearing.

Mr. B. squirms a bit and then confesses he has not been

Digitized by Google

entirely free from thrust-bearing trouble and even has thought seriously of trying the type Mr. A. was about to abandon. Everyone was thus brought into the discussion, and it was decided to make a careful study of the problems involved in the design of the clutch throwout. This was done, and eventually led to a new arrangement of the parts which insures uniform distribution of pressure on the bearing and permits lubrication from the outside with a minimum of trouble.

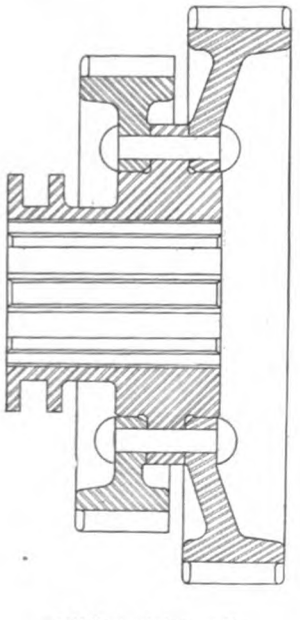
A gratifying amount of constructive work was brought about by these confessions. Patriotism impelled each one to disclose everything he knew about transmission design and to state freely his experience with the devices suggested. Those with improvements which they expected to incorporate in their product sometime in the future submitted ideas with commendable frankness. With nearly all the transmission makers of the country working together with such a splendid spirit, great progress was made, and at a meeting held June 2 in Washington, four makers decided to join in designing a new transmission for the Class A truck. Several other makers signified their willingness to adopt the new design later if they were called upon by the Government to make transmissions for Class A trucks.

As so much preliminary work had been done in previous meetings and by the engineering departments of transmission makers the main features of the new transmission design were quickly decided on, and the Ball and Roller Bearings Division of the S. A. E. Standards Committee was requested to recommend bearing sizes. The sizes of ball bearings it recommended were considerably larger than used in commercial practice, but the bearing engineers insisted that for military use they could not approve smaller sizes. Stress diagrams were made for all bearings, gears and shafts. At the meeting held June 20 in Columbus a tentative design was submitted. At this time drawings of most of the details had been made, but at this historical Columbus meeting the Government told us it would adopt one design only for each detail part of the A & B Trucks "to the last screw, bolt and nut." The transmission makers had progressed so far in this direction that it was an unbroken continuance of their work to consider the transmission and clutch for the Class B truck, which the Government stated was needed first.

Design Started July 30

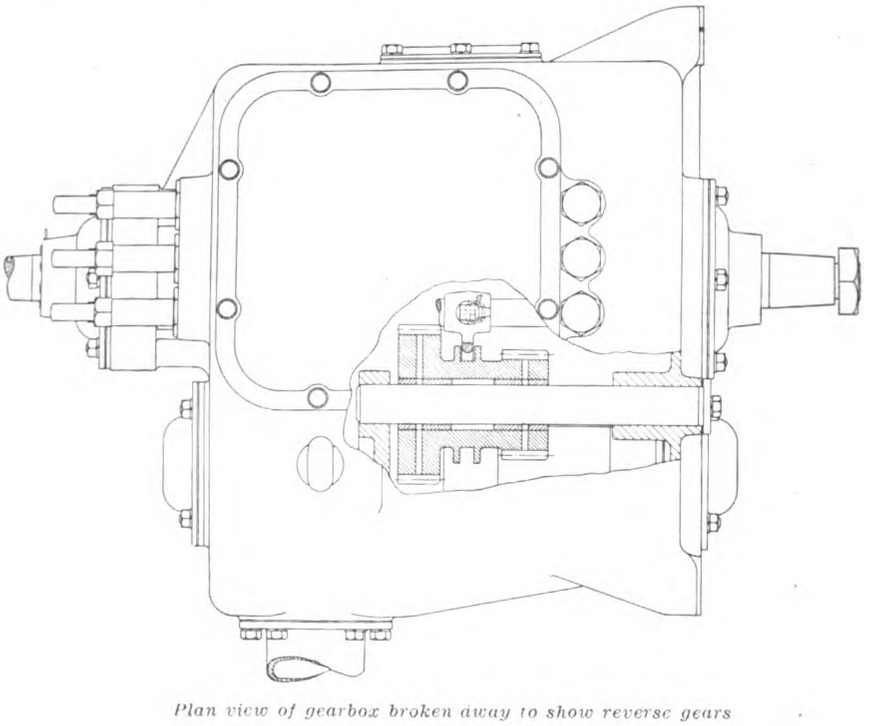
The Government asked for volunteers among S. A. E. members to go to Washington and design two sizes of military trucks. The desired number quickly volunteered and were called to Washington July 30, when the different groups commenced at once to consider their particular problems. The B transmission is of the amidship type with four speeds forward and one reverse. The main shaft and countershaft are located in a horizontal plane with the idler gear-shaft above and to the left looking from the rear forward. The horizontal type was adopted in order to get the ground clearance specified, 18 in. below the transmission at a point midway between the front and rear wheels.

The transmission weighs about 230 lb. The case is of aluminum. The front is supported by a 6-in. trunnion within which is mounted the outer drive-gear bearing. The rear is supported by two steel forgings bolted and doweled to the back of the case. The fact that the main shaft and countershaft are in a horizontal plane, and that the idler gear is placed above minimizes the depth below the main shaft.



Gear and Tooth Sizes

The gears are 5-7 pitch, 6 in. from center to center of main shaft and countershaft. The width of gears increases from 1¼ to 1½ in. from the constant mesh gears to the low, according to the tooth pressure developed and the work it is expected each speed will be called upon to do.



The speed ratios are 5.93 to 1 on first and reverse speeds, 3.23 to 1 on second, 1.76 to 1 on third, and direct on fourth speed. As the rear axle reduction is 9.5 to 1 this gives a total reduction of 56.335 on first and reverse.

It is common practice in transmission design to have the reduction considerably greater on reverse than on first. The ordinary four-speed transmission arrangement with a ratio of 5.93 on first would have one of 6.78 on reverse. A total reduction of 56.335 was considered ample to secure the tractive factor desired in the Class B truck under almost any road conditions, so it was decided to make the ratio on reverse speed in the transmission the same as on low, all working parts to the rear of the transmission can thus be made lighter than would have been required if the usual practice had been carried out, of having the reduction reverse greater than on low speed. The countershaft first-speed gear is forged integral with the countershaft. The other countershaft gears are held with a single key.

The reverse idler gears are made from an integral forging. The shifter slot is between the gears. All gears are made from forgings. The main shaft is 2¼-in. S. A. E. six-spline, ground all over except where threaded. A clearance is provided over the splines in the keyways of gears, the working fit being in the ground bore of the gear.

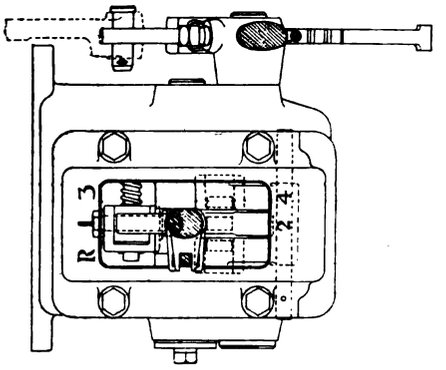
Digitized by Google



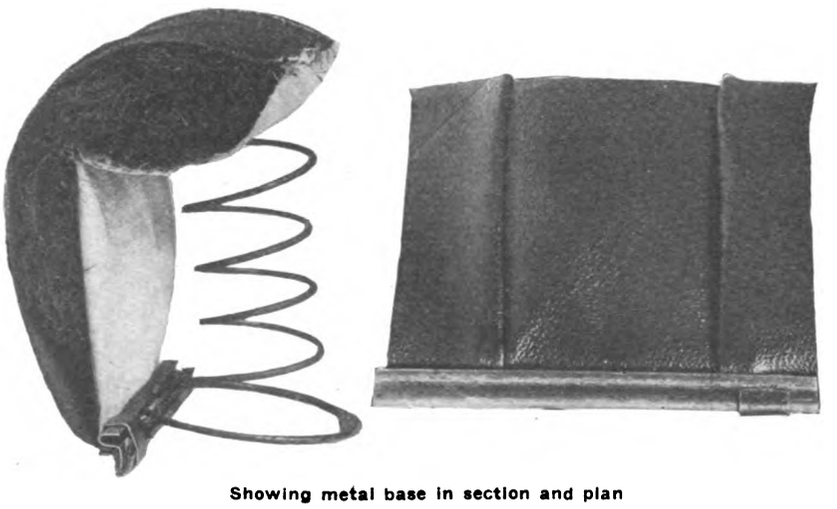
Three views of the selective control mechanism

All shafts are specified alloy steel equal to 3½ per cent nickel in physical properties, properly case hardened. Gears may be made of alloy steel equal in physical properties to 3½ per cent nickel. The steel may be high carbon properly heat-treated or low carbon properly case-hardened. All the gears are now being made of 3½ per cent nickel steel, low carbon case-hardened.

The lower part of the mesh lock-plungers are wedge shape. Instead of leaving a thin straight end, the end is machined concave and rounded off. This design gives greater wearing surface than the cone-pointed plunger and the concave end prevents the plunger from turning around. There is no inter-lock in the transmission, but a positive inter-lock is provided in the control set. The control set is a rocking-lever type.

Annular ball bearings are used for drive-gear shank, main-shaft case bearing and countershaft. The main-shaft spigot-bearing is of the solid roller type running directly on the pilot on the end of the main shaft and in the end of the drive gear. Plain phosphorus bronze

bearings are used for the idler gears. The drive-gear shank terminates in a 1½-in. S. A. E. taper and the main shaft in a 1¾-in. S. A. E. taper.



Although the several units of the Class B truck were designed by separate groups, the different groups kept in close touch with each other and the result is a truck of balanced design. The Class B transmission is in no sense a compromise design. Each part of the design had practically the unanimous approval of the transmission engineers on the job, and in most cases represents successful current practice. It is confidently expected to give a good account of itself under the most trying conditions on the battle front. Throughout the whole design S. A. E. Standards were used just as fully as they were available.

The speed-change H-plate is the S. A. E. recommended practice. No rocker arms are used in the transmission. The shifter forks are fixed to the shifter rods by hardened screws having special taper ends. The shifter forks are as short as the diameter of gears will allow. The arrangement is such that the shifter rod nearest to the idler gear is the one used for reverse. Grooves of 90-deg. V-shape are used.

Hayes Metal Base for Automobile Seats

THE Hayes Mfg. Co., Racine, Wis., has developed a new metal base for automobile seats, on which a patent has been obtained. A photograph of the construction is reproduced herewith. The base is very simple but is exceptionally strong and inexpensive to manufacture. Its use is claimed to result in a saving of both material and labor, and it should therefore appeal to car makers.

In trimming a seat with this base, the raw edge of the leather is brought over the extending flange. The locking or clamping strip is then applied and the seat is finished. The operation of trimming is said to require 2 min. per seat and there is no necessity for tacking, stitching of the leather, or sewing on of the welt for binding. Any style of trimming can be used, viz., plain, pleated, piped, etc. The Hayes Company is now ready to place the base on the market and expects a wide demand for it.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

The Military Motorcycle

OWING to the somewhat different organization of the motorcycle industry as compared with the truck industry, a different procedure has to be followed in the design of a motorcycle for general army use from that followed in the development of the army trucks. The great majority of motor trucks just previous to this country's entrance into the war were assembled from parts purchased in the open market, and the manufacture of truck parts was well organized. Therefore, when the problem of designing motor trucks for the army arose, groups or committees of engineers experienced in the manufacture of the different units were formed, and each group was entrusted with the task of designing a part for the Liberty truck.

There is practically no parts industry associated with motorcycle manufacture. Every motorcycle factory produces its own engines, transmissions, frames and other major parts. Therefore, there are no motorcycle parts specialists and it was not possible to evolve the standard motorcycle or Liberty motorcycle on the parts committee plan. Also, once the design is completed it will not be possible to let contracts for the manufacture of the different parts to factories experienced in that particular work unless the contracts are made with the established motorcycle manufacturers.

The plan worked out by the men in charge of the motorcycle branch of the department of motor transport was to select a number of motorcycle factories producing a type of machine similar to the one required, and with the aid of the engineers of these factories evolve a composite design using the engine of one factory, the transmission of another and the frame of the third. The advantage of this plan is that as soon as the design is completed one factory is already tooled up for each of the major parts of the machine. It may be readily imagined, however, that many difficulties will crop up in fitting together—in the course of evolving the composite machine—parts that were not primarily designed to go together. This may necessitate changes in the design of some of the parts of such nature that the tools used for its production become unsuitable or require extensive alteration. Also, there is a chance for differences to arise as to the selection of the parts, though the commendable spirit in which the motorcycle makers have co-operated in the past gives assurance that all difficulties will be smoothed out and the motorcycle program will be carried through with the same dispatch and efficiency as the motor truck program.

Aircraft Engine Types

IN motor truck work the four-cylinder vertical engine is in almost universal use, and in the tractor field the same type of engine is rapidly forging to the front and bids fair to attain a commanding position before many years have gone by. That there is no such uniformity of practice in the passenger-car field is due to the peculiar conditions affecting sales in this field. One might say that the passenger-car problem is not a straight engineering proposition. So many different requirements are made and the limitations of purchasers in respect to the prices they can afford to pay vary so widely that it is probable that we will not be able to settle on one or two engine types as most suitable for all passenger vehicles for a great many years to come.

In aircraft engineering almost every conceivable type of engine has had its try-out, from the two-cylinder opposed up to the eighteen-cylinder W type.

Owing to the fact that the power required has jumped by leaps and bounds and that any engine under 150 hp. is of little use to-day except for purposes of instruction, no engines of less than six cylinders are now used in actual warfare. The six-cylinder vertical engine is supreme in Germany, Austria and Italy. It is the simplest engine, having a perfect balance of reciprocating parts and it has been built in units up to 400 hp.

When the power required is more than this the plane can be fitted with two or more engines, and the Germans seem to prefer this plan to increasing the cylinder number.

In this country we have been featuring the Vee engine for the last four or five years, first for auto-

Digitized by Google

mobile and now for aircraft work. It is undoubtedly possible to build a Vee engine lighter than a vertical engine of the same horsepower within the power ranges required for military aircraft nowadays, chiefly because of the great saving in weight in the crankcase of the Vee, but there is a compensating disadvantage in the Vee in the greater resistance it offers to motion through the air. It is this factor of high head resistance which has entirely eliminated the radial stationary cylinder engine from the aircraft field and has greatly hampered the rotating radial engine. To minimize the head-on resistance, builders of Vee engines sometimes make the angle of Vee as small as constructional limitations permit and smaller than necessary to insure uniform spacing of explosions. In the twelve-cylinder engine the balance is not dependent upon the angle between the two-cylinder blocks, and angles of 50 deg. and even less have been used. In the eight-cylinder engine, if the angle is made less than 90 deg., not only is the sequence of explosions disturbed but the balance is rendered worse. Hence eight-cylinder engines heretofore have always been made with a 90-deg. angle, though we understand that experimental work is now going on with engines of a smaller angle of Vee.

An increased head resistance is equivalent to reduced power and the endeavor to overcome it at some cost in respect to other desirable features is therefore understandable.

There have been many attempts to go beyond twelve cylinders in aircraft engines, but whether any advantage can be secured seems problematical. Higher speeds would be possible with the multi-cylinder engines, but as the propeller does not operate efficiently at high speeds this feature cannot be taken advantage of except by the use of reduction gearing, which is objectionable. Crankshafts of enormous size have to be used in any case to transmit the power and these will also withstand the explosive and inertia pressures consequent upon the use of fewer and larger cylinders. The eighteen-cylinder would seem to be the most logical step after the twelve-cylinder, but we understand that experiments with sixteen-cylinder constructions are under way.

Private Aircraft Engine Development

WHEN the standardized aircraft engine program was first disclosed it was of an all-inclusive nature. The U. S. A. engine, as it was then referred to, was to be made in four, six, eight and twelve-cylinder models, all with the same size and design of cylinder. After production was once well started these engines were to be used for all requirements of our aerial forces. The announcement had the effect of subduing private enterprise in developing new types and more efficient forms of engine. If it had not been for this, the $640,000,000 appropriation would have mightily stirred designing talent throughout the country.

It seems now that plans have been somewhat modified. While the Liberty engine program is being proceeded with as fast as possible, manufacturers of other efficient engines will be given a chance. New foreign engines are being put in production here and there is considerable activity in American drafting rooms on new designs. The aircraft authorities of the allied nations do not favor the policy of putting all eggs in one basket, though they fully realize the advantages inherent in one-design engines from the standpoint of both production and replacements. The feeling here seems to be that the demand for engines will be so great that the Government cannot afford to refuse the purchase of any good engines offered to it.

Your Responsibility

TO win the war we need to do things—to do them quickly, with less man power and less waste. This means increased activity. It means more efficient use of every piece of equipment with which the work is to be done. It means more efficiency of all the equipment that we employ. We are not getting the maximum of activity. We are not getting the maximum of activity because the great arteries of transportation, which speed our material to us and distribute our goods for us, are overloaded. Our railroad facilities are too small. Eight years ago James J. Hill said that unless we put a billion dollars a year for five years into railroad facilities, they would break down under the growing load. We did not provide the money and, consequently, the railroad facilities are not large enough. Neither the efficient control of the Government nor the wisdom of the railroad men can solve the present freight difficulty. The transportation problem is your problem. It is our problem. If we are to maintain our business as members of the third largest industry in the country, an industry intimately connected with a flexible unit transportation, which can be used where railroads cannot go, which can be used to relieve the railroads, it is up to us to solve the transportation difficulties of our own business by the efficient use of the transportation equipment which we are manufacturing and to apply our industrial knowledge and organization to the work of constructive suggestion for the improvement of the general transportation situation. By practical application of this flexible unit transportation equipment, the railroads can be relieved of a burden too great for their equipment and facilities to take care of.

A time of emergency such as this is no time for sitting back and letting matters take their own course. It is a time to do things. In each manufacturing center in the automotive field there is a sufficient number of far-sighted business men acquainted with the practicable possibilities of these transportation facilities to work out methods by which, in a creditably short time, a large measure of relief can be applied to the situation. The automotive industry can undertake for itself and suggest to others relief measures which will aid the Government and obviate the necessity of Governmental action, which must be slow—and unsuited to local conditions.

Latest News of the

Stettinius May Head War Board

Need for Centralized Authority Would Give Board Greatly Enlarged Powers

WASHINGTON, Feb. 6—It is probable that Edward R. Stettinius will be placed at the head of the War Industries Board and that this board will be given greatly enlarged powers similar to those mentioned in the Chamberlain Bill. It is said that President Wilson recognizes the need for centralized control but desires that such control be lodged in the War Industries Board, which is an experienced, established body, rather than in any new board which might be created. If Stettinius is so appointed, and in view of the new priority rulings which are outlined in another column, H. L. Horning, chairman, Automotive Products Section of the War Industries Board, will have considerably enlarged powers and it will be necessary to install various departments in order to control priorities and the approval of orders. Under the new priority ruling each division of the Government will pass on priorities affecting its particular work. For example, the Automotive Products Section will pass on priorities regarding trucks.

Quartermaster Trailers Shipped

CLEVELAND, Feb. 7—The first of the new 1½-ton Class A four-wheeled Quartermaster trailers have been shipped from this city and Detroit. Another concern has some parts for Ordnance Department trailers.

—

No Airplane Mechanics Shortage

WASHINGTON, Feb. 7—There will be no shortage of airplane mechanics. Statistics gathered by the National Advisory Committee for Airplanes from records of the Signal Corps show that this branch of the service is well organized and able to supply the requisite number of repairmen to keep our fleet in action after it gets well started. Thousands of enlisted men are now in training in various schools and manufacturing establishments, and the work is being enlarged constantly. Engine mechanics for the four motor mechanic regiments now being organized at Camp Hancock, Augusta, Ga., have been and are being obtained by a system of selection from the national army. Men of required qualifications have enlisted in the aviation service already. The balloon service is able to get practically all the men it requires by selection from the aviation recruits. The necessary training to make the men work as a team is given to them at the various balloon schools.

—

Republic Men from Tractor Company

ALMA, MICH., Feb 6—Interests closely affiliated with the Republic Motor Truck Co. have formed the R. & P. Tractor Co., which will start with $5,000 capital and manufacture a tractor embodying the ideas of F. W. Ruggles, president of the Republic company, and Channing Parsons, formerly general manager of the same company. The company will commence manufacture in a wing of one of the Republic buildings. Ruggles is president of the tractor company, other officers being: Vice-president and general manager, Channing Parsons; secretary, Harry Green; treasurer, T. A. Burt; directors include the officers and F. L. Smith.

—

Reo to Make Worm Drive Truck

LANSING, Feb. 7—The Reo Motor Car Co., which has been making only a 2-ton chain-drive truck, is now experimenting with a worm-drive truck of the same size and similar design. This will be ready by spring, but no details of it are available yet.

—

Durant to Confer on Fuel

WASHINGTON, D. C., Feb. 7—W. C. Durant, who is chairman of the committee which was appointed to confer with Dr. Garfield, was to have called a meeting last week but did not do so. It is understood now that he will either call an informal gathering to-morrow or for the early part of next week. Henry Ford was in Washington yesterday and conferred with Dr. Garfield about fuel.

—

Stewart Warner Earnings $2,200,774

CHICAGO, Feb. 7—Net earnings of the Stewart Warner Speedometer Corp. for 1917 were $2,200,774, which is approximately 19 per cent on the capital stock. This is figured before the deduction of income and excess profits taxes, for which a reserve of $340,000 was set aside. During the year $600,000 was paid out in dividends, and a total unappropriated surplus of $5,456,215.38 still remained on Dec. 31. The net earnings for 1916 amounted to $2,215,042.

—

New Grant 3½-Ton Truck

FINDLAY, OHIO, Feb. 7—The Grant Motor Car Corp. is designing a new 3½-ton, internal gear truck, and expects to have a model completed in 2 or 3 months. No details are available yet, except that the truck will have Torbensen rear axle and a Continental engine.

Chicago Show Draws 150,000

More Than 8,000 Dealers — Great Interest of Farmers Deemed Significant

CHICAGO, Feb. 2—The Chicago motor car show as the intrinsic business criterion of the industry has vindicated itself. The total attendance is put down as 150,000. The show resulted in heavy retail sales and drew a large number of dealers, estimated at eight thousand, this being more than double the number that ever attended before. These men represented the Mississippi Valley and the vast area to the north, west and south of it to our boundaries.

The large dealer attendance is significant and indicates that the agricultural districts of the country are anticipating a large business with the coming of spring, at which time the farmer will be able to move his heretofore transportation-bound product to market and thus stimulate business. This is an event toward which dealers must look forward with foresight and optimism. It must be met with American business methods.

—

Fifth Foreign Trade Convention Meets

CINCINNATI, Feb. 7—The Fifth National Foreign Trade Convention, called together by James A. Farrell, chairman of the National Foreign Trade Council, will meet to-day at the Gibson Hotel and will continue to-morrow and Saturday. The following subjects will be discussed: Foreign trade achievements in the past; after-war conditions of foreign trade; exports and imports control; foreign credits; education for foreign trade, and the merchant marine.

The convention will hold its banquet Friday evening, Feb. 8, at 7 p. m. The Government is co-operating with the council to make trade information and advice concerning foreign trade markets available.

—

Chalmers Corp. Reduces Common Stock

NEW YORK, Feb. 7—Stockholders of the Chalmers Motor Corp. at the annual meeting held here yesterday voted to reduce the authorized common stock from 532,000 shares, no par value, to 400,000. The 132,000 shares involved are unissued but authorized stock, held in the treasury. The following board of directors was elected: Jules S. Bache, J. Horace Harding, Hugh Chalmers, Henry E. Butler, George C. Van Tuyl, Jr., Joseph H. Clark and W. P. Kiser.

Duesenberg Buys Fiat Plant

Use Equipment to Enlarge Elizabeth Plant Now Devoted Exclusively to Airplane Engine Work

NEW YORK, Feb. 5—The Duesenberg Motors Corp., Elizabeth, N. J., has purchased the buildings and equipment of the Fiat Co., Poughkeepsie, N. Y., and will commence immediately to remove the bulk of the equipment to its Elizabeth plant. The Fiat company will continue to occupy a part of the buildings and the production and assembly of Fiat cars will go on much as usual.

The Duesenberg company purchased this property and equipment in order to obtain immediately a large amount of machinery with which to carry on the production of airplane engines for the government. At the present time, Duesenberg is concentrating its entire manufacturing facilities on the production of Bugatti airplane engines for which it has a large contract. The production of Duesenberg engines has been entirely stopped, though at some future time arrangements may be made with some Western engine builder to manufacture the small Duesenberg four.

Present plans of the Duesenberg company are to move a large part of the machine tool equipment from the Poughkeepsie plant to Elizabeth as soon as facilities for its reception can be completed. This will double the capacity of the plant. Eventually, it is planned to have new machinery, which is due to be delivered early in the summer, installed in the Poughkeepsie plant, where some of the minor machine operations will be carried on. The purchase includes all the Fiat buildings and about 30 acres of land.

The Fiat company states that it has no intention of stopping the manufacture of cars and that this work will be carried on indefinitely with but little interruption.

—

Urge Water-Power Development

WASHINGTON, Feb. 6—The United States Chamber of Commerce is conducting an investigation with a view to ascertaining the sentiment for legislation to encourage the development and conservation of the water power resources of the United States. A questionnaire is being sent out to more than half a million American business men to obtain a referendum vote which it is expected will be of influence on Congress in indicating how the business men of the country look on the water power question. The committee on Water Power Development recommends Federal legislation encouraging the development of water power with permits for a period of at least 50 years. It is estimated that the undeveloped water power of the country exceeds the total steam power now in service.

—

Two More 4-Day Shut-Down Periods Considered

WASHINGTON, Feb. 6—Instead of eliminating future heatless, workless Mondays in the industries, it is understood now that Fuel Administrator Harry A. Garfield is seriously considering two more four-day shut-down periods. One of these would include Lincoln's Birthday and the other would include Washington's Birthday. It is understood to be the plan of the Fuel Administration to make two such periods of industrial suspension take the place of the remaining heatless Mondays.

—

Build Airplanes in Middle West

WASHINGTON, Feb. 6—Howard E. Coffin, chairman of the Aircraft Production Board, is authority for the statement that "fully fifty per cent of the airplanes constructed for the United States Government will be produced in factories in the middle West." It is the plan, as the program for construction expands, to use many of the plants in the middle West sections where woodworkers are now employed on furniture, pianos and other goods less essential to the winning of the war.

—

G. V. Interests for Aeronautical Engine Company

NEW YORK, Feb. 5—Interests allied with those of the General Vehicle Co., Long Island City, whose plant was taken over by the Government recently for the production of airplane engines, have formed the Aeronautical Engine Co. This company will take over the aircraft work of the General Vehicle Co.

—

Franklin to Make Rolls-Royce Airplane Parts

NEW YORK, Feb. 5—Contracts for parts for airplane engines for the allied governments continue to be let to automobile manufacturers. Among the latest reported to receive such contracts is the H. H. Franklin Mfg. Co., Syracuse, N. Y., which, it is understood, will make 1500 crankshafts for the Rolls-Royce aviation engines. Others working on similar contracts are the F. B. Stearns Co., Cleveland, and the Taft-Pierce Mfg. Co., Woonsocket, R. I.

Probe Airplane Plans in Senate

Investigation Reveals Spruce Shortage—Continue Monday Closings—Other Washington News

WASHINGTON, D. C., Feb. 4—The chief event of the past week here was the investigation of airplane activities by the Senate Military Affairs Committee. For military reasons the majority of the sessions were in secret, but the few open meetings served to show both progress and procrastination.

The greater part of time of the open sessions was consumed by Major Charles Sligh, who used the time of the committee to dwell at considerable length upon his personal troubles with Howard E. Coffin, chairman of the Aircraft Production Board, and Col. E. A. Deeds, of the Signal Corps. He charged them with neglecting certain recommendations he made, but in several instances was induced by skillful questioning on the part of Senator Chamberlain to admit that the blame was to be placed with the head of the War Department, instead of with either Coffin or Col. Deeds.

The most important testimony in open session related to a considerable shortage of spruce for planes. This was attributed rather to the procrastination of big Western lumber interests than to the Aircraft Board.

Coffin, always demanding secret hearings, dwelt chiefly upon airplane design, changes of type, training of aviators, airplane production and aviation tactics in war. According to Senators who questioned him in the final hearing last Saturday, Coffin made a detailed statement which was regarded by the Senators of the committee as favoring definite affirmative action in support of the bills for a War Cabinet and Munitions Director.

In one sense it was unfortunate that Coffin called for a secret hearing Saturday. The testimony of Thursday and Friday tended to show inefficiency in our aviation activities, which was the reason that Mr. Coffin was recalled for explanation. Had this last hearing been an open one it would probably have served to dispel the doubts in the public mind as to our actual progress.

Late last week a joint statement by Dr. Garfield, Fuel Administrator, and William G. McAdoo, Railroad Administrator, was to the effect that they are considering suspension of the Monday closing order. They will hold a conference again to-morrow on this matter, at

Digitized by Google

which time a decision will be reached.

The conference of last week, and the partial decision to countermand the Monday closing order, was induced in great part by a speech by Congressman Smith of Michigan, in which he showed that the closing of industry in Grand Rapids last Monday produced an actual saving of 6 tons of coal, at a cost of over $22,000.

He showed that it required almost as much coal for the furniture factories to start again as was saved.

In addition, he discussed the situation in Detroit, taking for example Dodge Brothers, who, he stated, had their force dissipated 70 per cent by the order, despite the fact that they are working on munitions for the Government and have a full supply of coal on hand.

He testified that Dodge Brothers are making cannon for our army and purchased 100,000 tons of coal last February, which has been delivered. From their coal pile they supplied 3000 families in Detroit who were permitted to come and take and use the coal. Mr. Smith went on further to show that the Monday closing order "did not save an ounce of coal or relieve congestion anywhere."

Normal Labor Conditions

Labor conditions, according to placement figures of the Department of Labor, are normal. These figures, issued monthly, show the numbers of men seeking work, and the numbers of employers seeking labor. There has been little change in the figures for any time in the last twelve months.

The department, through its new employment reserve service, is enrolling thousands of workers throughout the country for work in the shipyards, in anticipation of the demand for such workers in the next 6 months.

An important result of the first week of this enrollment is that great numbers of those enrolling are men now out of work, and seeking immediate employment—definite proof that there is no such labor shortage existing as some agitators would have us believe.

The department is still insisting upon a sane course for the handling of wartime labor conditions, and has established several new bureaus to maintain a broad national labor policy. A Publicity Division has been appointed, which aims to tell the public that labor is merely a matter of adjustment, during the present emergency, and not a question of labor shortage. It will point out through its publicity channels that while there are shortages of labor in some localities, there are surpluses equally great in others.

The word non-essential, as applied to industries, has again been heard in Washington in the past week, when a conference of state directors of the Public Service Reserve endorsed the "conversion of non-essential industries rather than the establishment of new factories." These directors no doubt are unaware that official Washington has learned that

Federal Licenses for Fuel Oil Men

Transportation Difficulties, Not Shortage, Necessitate Government Action

WASHINGTON, Feb. 5 — Manufacturers and distributers of fuel oil with gross sales of more than 100,000 barrels a year after Feb. 11 must have Federal licenses to do business. Although there is an abundant supply of oil, transportation difficulties have made such action necessary and President Wilson has taken this step. The distribution of fuel oil is to be under the direction of the oil division of the Fuel Administration, headed by Mark L. Requa. There is no intention to extend this emergency measure to cover gasoline and kerosene which are not included under the term fuel oil.

Coincident with the President's proclamation Fuel Administrator Garfield has made public the following list which will govern priority of deliveries:

1—Railroads and bunker fuel.
2—Export deliveries or shipments for the U. S. army or navy.
3—Export shipments for allied navies and other war purposes.
4—Hospitals where oil is used for fuel.
5—Public utilities and domestic consumers now using oil (including gas oil).
6—Shipyards engaged in government work.
7—Navy yards.
8—Arsenals.
9—Plants engaged in manufacture, production and storage of food products.
10—Army and navy cantonments where oil is now used as fuel.
11—Industrial consumers engaged in munition manufacture and other articles under government orders.
12—All other classes.

The new order has been necessitated entirely by the inadequacy of transportation facilities. According to a statement issued to-day: "The oil supply is abundant."

At present Dr. Garfield and his advisers feel that there is no reason for the extension of the order to cover control of gasoline and kerosene.

—

Five Truck Trains Near Destination

WASHINGTON, Feb. 4 — The five motor truck convoys en route to the Eastern seaboard from Detroit are nearing their destination. The convoys have had to contend with the most severe winter storms, and in a number of instances were snowbound for two and three days at a time. The convoys are traveling one day apart.

—

50 Cars Sold at Chicago Salon

CHICAGO, Feb. 5—Chicago's salon in the Elizabethan room of the Congress Hotel reflects the same spirit of optimism that is noticeable at the Coliseum, and between 50 and 60 cars have been sold. The attendance this year was better than in 1917. The salon exceeded all expectations in the number of visitors as well as the amount of business done. The Elizabethan room permitted the exhibition of only 20 cars as against 80 in New York. Unless war conditions make it impossible, space next year will be doubled or tripled.

—

Scientists to Test Garabed

WASHINGTON, Feb. 4—Garabed, the new free energy which has been discussed in Congress and is supposed to have been invented by G. T. K. Giragossian, will be tested in Boston shortly by eminent scientists to be selected from the faculties of Harvard, Yale, Massachusetts Institute of Technology and the Worcester Polytechnic Institute. It was learned here to-day that just before the resolution was passed authorizing the tests the British Embassy promised the inventor that if the United States Government did not accept the invention Great Britain wanted the opportunity to do so.

—

Armitage President of Whitman & Barnes

AKRON, OHIO, Feb. 1—A. D. Armitage was elected president of the Whitman & Barnes Mfg. Co. at the annual meeting of the stockholders held here yesterday. Frank A. Seiberling was appointed a director to succeed A. B. Rinehart, former president of the company. At the meeting the regular quarterly dividend of 1½ per cent and an extra dividend of 1 per cent, payable Feb. 15, were declared.

—

Globe Truck Elects Officers

EAST ST. LOUIS, Feb. 5—The Globe Motor Truck Co., at its first annual stockholders' meeting, elected the following officers: David A. Marks, president; Christopher Beckemeier, vice-president; Nansen J. Marks, secretary. David A. Marks, Louis Hughes, George Baeker, John Soy, George Chapline, Christopher Beckemeier and William G. Meiher are the directors. The company was formed in January, 1917.

—

New Bell 1½-Ton Truck

YORK, PA., Feb. 5—The Bell Motor Car Co., Inc., will manufacture a new 1½-ton truck with internal gear drive and wheelbase of 112-124-136 in., in the factory it recently purchased from the Pullman Motor Car Co., York. It will also bring out a new model Bell passenger car.

—

Miller Top Elects New Officers

CARO, MICH., Feb. 2—The following officers of the reorganized Miller Top Co. have been elected: President, Max Zemke; vice-president, Peter Miller; secretary and treasurer, M. G. Atwood. These three, with N. B. Atwood and D. L. Lazelle, constitute the board of directors.

Slight Decrease in 1917 Exports

Few Trucks Shipped in December—Month's Total Largest for Entire Year

Mos.	Cars	Value	Trucks	Value	Parts
Dec..	6442	$5,375,706	825	$1,585,481	$4 952,465
Nov.	5006	4,820,738	1435	3,430,162	2,535,230
		1916			
Dec..	4911	3,658,660	1331	3,689,314	1,755,333

WASHINGTON, Feb. 5—In spite of the fact that the truck exports during December were less than half of the November amount, the total exports show an increase of $1,127,522 over the previous month, and an increase of $2,810,445 over December, 1916.

The total amount of exports for 1917 is slightly lower than that for 1916, the difference being less than $1,000,000. There was a great increase in the number of passenger cars shipped last year, but truck exports have fallen off considerably.

Canada was by far the largest purchaser of passenger cars during the year, and the United Kingdom bought three times as many trucks as any other country. Argentina follows Canada in the number of passenger cars bought, with only one-fourth of the number. Chile is third in the number of cars bought, but second if value is considered.

Great progress was made during the year in the number of trucks shipped to Russia. Strangely enough, Russia in Asia received twice as many as Russia in Europe.

Although South America is a good market for passenger cars and parts, not one truck was shipped there.

—

To Make Unit for Ford Cars

YOUNGSTOWN, OHIO, Feb. 6—The Lau Iron Works, manufacturer of the Elton truck unit for Cadillac cars, will also manufacture a truck unit for Ford cars.

December Gasoline Exports Drop

NEW YORK, Feb. 5—Gasoline exports in December amounted to 35,335,977 gallons valued at $8,674,987. This is a drop of 40 per cent from the amount exported in November, which was the largest month of the year, but show a 50 per cent gain over the exports in December, 1916.

The total amount of gasoline exported during 1917 was 416,249,063 gallons, at a cost of $93,166,692. This is an increase of 16 per cent in quantity and 30 per cent in value over 1916 exports.

The average price in December, 1917, was approximately 24 cents a gallon, about 5 cents more than in December, 1916. The Allies are the largest importers of gasoline, buying it chiefly for war purposes, since civilians in neither France nor England may use it under ordinary circumstances.

—

Franklin Sales Increase 135 Per Cent

BOSTON, Feb. 5—Sales of Franklin cars during 1917 increased 135 per cent over 1916, according to figures given out by the Franklin Mfg. Co. The greatest production was in October, when 294 cars were turned out in a single week. The company's business during the year amounted to $16,000,000. The last buildings needed to bring the company's capacity up to 15,000 cars a year are now completed and in use.

—

$37,898 for Pullman Creditors

YORK, PA., Feb. 2—Receivers for the Pullman Motor Car Co. have filed a report with Judge Charles B. Witmer, of the United States District Court at Scranton. Unless exceptions are taken to the accounts of the receivers within 30 days the report will be finally confirmed at the March session of the district court. The receivers' report shows a balance of $37,898.36 for distribution among creditors.

Goodrich Net Profits $12,675,000

Preliminary 1917 Report Shows 33 Per Cent Gain Over Previous Year

AKRON, OHIO, Feb. 5—The B. F. Goodrich Co. made a preliminary report for 1917 yesterday, showing net profits of $12,675,000, before the Federal income and excess profits taxes are deducted. This is 33 per cent more than the net profits of 1916. The figures given out by the company follow:

	1917	Difference between 1916 and 1917	
Net profits after provision for maintenance, depreciation, and doubtful debts.....	$12,675,000	Inc.	$3,106,325
Provision for income and excess profits taxes.....	2,250,000	Inc.	$2,250,000
Net earnings for dividends	$10,425,000	Inc.	$856,235
Preferred dividends.	1,848,000	Dec.	52,000
Balance for common	$8,577,000	Inc.	$919,235
Common dividends..	2,400,000		
Surplus	$6,177,000	Inc.	$919,235

The surplus on Dec. 31, 1916, was $14,920,000, which added to the above made the total surplus on Dec. 31, 1917, $21,097,000. From this amount $900,000 was deducted and set aside for redemption of preferred stock, and $39,187 representing the reduction of preferred stock purchased from cost to par, making a total adjustment of $939,187. When this is deducted from the total surplus, there still remains $20,157,813.

The directors, subject to the approval of the stockholders at their annual meeting on March 13, have voted to retire 9,000 shares of preferred stock prior to July 1, 1918. This will make a total retirement of 45,000 shares.

Maxwell Develops 3-Plow, Inclosed Transmission Farm Tractor

Has Detachable Head 4 x 6 Engine, Three-Speed Gearset and Final Drive by Bevel Gears Through a Differential—Can Be Used for All Farm Work and Also on Roads

The new Maxwell farm tractor is a versatile machine and can be used for practically every kind of farm work as well as for towing farm products to market over the roads

THE Maxwell tractor, which was held under cover until the Chicago show and then sprung as a surprise at the annual dealers' banquet of the Maxwell-Chalmers distributers, is of a type which would naturally be expected from an automobile manufacturer. This tractor has been under development for about 5 years. It was concealed under the name of the "Chief" and received its real try-outs on the sugar plantations of Louisiana.

The tractor is a three-plow machine giving a plowing draw bar up to 3000 ft. lb., with a normal output of approximately 2600. It is a four-wheel type, weighing 3600 lbs. with tanks empty, and drives through two 48 by 10 in. rear wheels by means of an enclosed transmission. The tractor is, throughout, what may be called an automobile type, for, although nothing about it follows automobile practice, yet the layout is such as closely parallels automobile design. The wheelbase is 6 ft., and the minimum tread is 44 in. This, however, is adjustable, as will be explained later. The tractor can turn in a circle of 21 ft.

A frame construction is used, consisting of two deep angles with the flanges turned in so that the entire frame structure is virtually a U section. In this U rest the engine and transmission and all the working parts. The frame is 7 in. deep and is of semi-flexible nature, with a flexible front support at the center of a transverse spring mounted on the front axle.

This construction gives a tractor which is not affected by the distortions due to inequalities of the ground. The construction of the tractor is of two main units, the powerplant and the transmission.

The backbone of the powerplant is made up of the cylinder casting, which includes the crankcase, and a bell housing. The second part is a casting, which includes all the transmission gears and extends from the bell housing back to the rear axle.

These two component castings bolt together at the bell housing, giving a rigid central construction for the working parts and form the two distinct structures which go to make up the principal part of the machine.

The powerplant is a three-casting unit composed of the cylinder block above described, a casting for the head, which is detachable, and a casting forming the oil pan.

The engine proper is a detachable L-head unit of very simple design. The cylinder dimensions are 4 by 6, although this may later be changed to 4¾ by 6 to fit into a proposed production schedule involving a truck unit of heavy capacity. Nothing definite, however, can be stated on this at the present time.

The L-head engine is conventional in every respect with the exception that the water jackets are of much greater capacity than usual. The jackets extend to the bottom of the cylinder, so that there is a straight wall on the outside of the cylinder directly down to the crankcase, giving a completely cooled unit of large water capacity.

The water area round the cylinder-head, which is a separate casting, is also particularly large with the water brought well around the spark plug aperture to eliminate any chance of hot points developing in their proximity.

The crankshaft is carried on three bearings and is a 2½-in. unit with all bearings 2½ in. in diameter. The connecting-rod bearings are 3½ in. in length and the main bearings are exceptionally large for the normal engine speed, which is 900 r.p.m. These bearings from front to rear are 3¾, 3½, and 4¼ in. in length.

An interesting oiling system has been worked out. It is one of the few truly combined pressure feed and splash systems, as both the pressure feed and the splash are relatively complete within themselves.

In conjunction with the oil pressure feed, which operates through a drilled crankshaft, there are three pumps, one pump being located at the forward end of the crankcase, one at the rear end, and the third taking the oil from the sump and delivering it to the three main bearings, from where it is led by the hollow shaft to the connecting-rod bearings.

With these three pumps, if the tractor has to climb a stiff grade, and the oil should run to the back of the case, the pump at the rear will carry the oil back to the sump, where it will distribute to the main bearings. Should the tractor

Digitized by Google

be inclined to the front the front oil pump will act in the same way. Thus, in spite of the difference in purpose, a hint has been taken from aircraft practice.

The water system holds 10 gal. Water is pump-circulated through a vertical tube radiator with cast tanks. Ignition is by magneto, the make of which has not as yet been fixed, the magneto being equipped with an impulse coupling for starting. The magneto is driven from the water pump shaft through a flexible coupling. Gravity gasoline feed is employed, with a 26-gal. tank mounted behind and above the engine. The fuel employed is gasoline, and the hot-spot manifold design is employed to provide for evaporation.

With this engine of the 4½ in. diameter type, 29 hp. is delivered at 900 r.p.m., which is the governed speed. The governor is a gear-driven unit on the same shaft as the fan.

A cone clutch faced with asbestos fabric is enclosed in the bell housing, and the service brake is mounted on the reverse side of the clutch. Thus when the clutch pedal is depressed, the cone, which has a diameter of 16 in. and a face width of 3 in., is first pulled out of the driving member and a further depression of the pedal results in bringing the brake into effect.

The transmission gearing provides three speeds, the ratios being such that on high gear the tractor travels 6 m.p.h. at 900 r.p.m.; on intermediate, or plowing speed, 2¼ m.p.h. at 900 r.p.m.; and on low, 1½ m.p.h. at 900 r.p.m. The transmission gearing is all mounted on anti-friction bearings, and none of the center to center distances of these bearings exceeds 14 in.

The final pinion has a 7 in. face and the rear axle gear a 6 in. face. All of these are chrome-nickel gears running in oil.

The drive passes from the clutch shaft through bevel gears to a transverse shaft. This engages in turn with a second transverse shaft, carrying the reduction gear, and from this second transverse shaft it passes back through the final pinion to the rear axle.

The first transverse shaft has a pulley on the right end and a winch or cable hoist on the opposite end.

By means of these two devices any work desired by farmer, contractor, or any other type of engineering farming or construction work requiring animal power or mechanical power can be performed. The tractor can lift itself off the ground if that is desired, or it can lift wagons to points where they can be dumped in their entirety if the tractor is used by contractors who need that sort of assistance.

The pulley makes it possible for the farmer to use the tractor as a stationary powerplant, and a snubbing block can be fitted over the pulley if desired for work in which a device of this kind gives more practical assistance.

The rear axle carries the differential mounted on the outside and the axle itself is hollow, and after it passes through the differential housing, it drives through tubular units which can be added to by inserting additional members which really form part of the rear axle, thus giving an adjustable tread.

This shows the appearance of the Maxwell tractor equipped for use on hard roads. The design is compact and follows the usual practice with the engine under a hood at front

The combination of the adjustable tread and adjustable draw bar and the provision of both cable hoist and pulley, or snubber block, together with shieve combinations, allow practically any work to be accomplished with this tractor that is desired. The load can be attached to the draw bar at any point, and if desired this can be used as a frame to which a small crane can be attached. The tractor has been designed throughout with an eye to maintenance, and all parts are readily accessible, the oil tubes, for instance, all being exterior so that they can be taken out and cleaned. There are two oil wells, one for the engine and the crankcase, and the other in the gearbox supplying all the transmission gearing. The oil is circulated in the gearbox by means of a gear wheel which picks it up and allows it to flow over to the surfaces.

The tractor is not in production as yet, but will be as soon as it is possible to co-ordinate the Maxwell-Chalmers plant which at the present time is doing considerable Government work. The manufacture of the tractor will not interfere with this, however, and production will not be long delayed. The price of the tractor is not fixed and cannot be until production is started and costs accurately estimated. It will naturally depend largely on the number scheduled. It can be predicted, however, that this tractor will take its place among low-priced machines.

—

Hot-spot Manifolds Criticised

MINNEAPOLIS, Feb. 6 — Hot-spot manifolds for farm tractors burning kerosene came in for much criticism at the monthly meeting of the Minneapolis Section of the S. A. E. to-night, when Professor Mowry of Minnesota State University read a paper on "Tractor Fuels" before one hundred and twenty-five members of the section and their guests.

Professor Mowry gave reports of laboratory tests with different kinds of manifolds and showed the quantity of kerosene that entered the crankcase. With the Clapper manifold after a one-hour test with the engine running at 750 r.p.m. under full load 0.1 lb. was added to the crankcase oil. With a Holley vaporizer the engine speed had to be increased to 850 r.p.m. to give the same horsepower and 0.7 lb. was added to the crankcase oil. With a Duplex manifold the speed was 820 r.p.m. to give the same horsepower and 0.3 lb. was added to the crankcase oil.

W. G. Clark, engineer of the Bennett Carbureter Co., differed with Professor Mowry, contending that hot-spot manifolds cut down volumetric efficiency as much as 33 per cent and that it is necessary to use engines that are too heavy and that to-day engine weight must be reduced. The farmer objects to having a 40 hp. engine to give only 30 hp. just because a hot-spot manifold is used to permit burning kerosene.

With the use of a double manifold, the entire charge is heated but not to the same degree in all cylinders so that preignition is difficult to overcome. The volumetric efficiency is reduced too much, there is smoky exhaust and kerosene in the crankcase. Too many tractor makers declare they can run on kerosene but this statement is misleading. It is true they can run on it but they do not burn it as it should be burned.

Clark argued in favor of furnishing a dry gas from kerosene which is possible at a temperature of 110 deg. providing the manifold is of small diameter and the gas velocity maintained high. If the gas velocity is not high enough a higher temperature must be maintained, a temperature of 450 deg. being needed at atmospheric pressure to maintain a dry gas from kerosene.

80,000 Aviators Available for Air Fleet

Senate Investigating Committee Reveals Delay of 2 Months in Program by Changes in Design and Drafting of Skilled Workers Into National Army

Eighty thousand aviators, trained or nearly trained, are available now for the American aviation fleet.

America's airplane program, which will cost $1,000,000 in addition to the $640,000,000 already expended, has been delayed two months because of necessary changes in the type of combat machines, due to the altering of plans to meet the ever changing German tactics.

Delay has also been caused by the drafting of thousands of skilled toolmakers into the National army.

Inability to secure adequate supplies of spruce for the manufacture of planes has been caused by unwillingness on the part of the great lumber concerns to cut sufficient timber to produce the kind of spruce needed, and also by failure to place an official in the lumber districts with full authority.

These were the more important developments of the open sessions of the hearing of airplane activity by the Senate Military Affairs Committee this week. The first hearings Monday, Tuesday and Wednesday were in executive session, and no details were made public. On Thursday and Friday sessions were open to the press, and discussions by Col. E. A. Deeds, Col. Montgomery, Major Charles R. Sligh and ex-Governor Oswald West of Oregon were heard.

Following the opening sessions Howard E. Coffin, chairman of the Aircraft Production Board, was again recalled by the committee which, at his request, placed to-day's hearing in executive session, maintaining secrecy about the developments.

Baker's Brother Lost Contracts

At the hearing on Thursday it developed that H. D. Baker, a brother of the Secretary of War, had been interested in an airplane factory at Niles, Ohio, which had, but lost, contracts with the Government.

Before this matter had been gone into deeply it was learned that as soon as the Secretary of War knew of the contract he ordered it cancelled. Col. Deeds, assistant to Gen. Squier, Chief Signal Officer, testified that H. D. Baker had conferred with him last June about securing a contract, but had been turned down because the plant was not ready to produce.

Later, when the plant was equipped, and known as the Engel Aircraft Co., it was given contracts which Secretary Baker cancelled soon after. With regard to this matter Secretary Baker issued a statement explaining that although the men interested in the company were of the highest standing, he directed that the contract be cancelled to avoid possibility of embarrassment. H. D. Baker also withdrew from the company.

Col. E. A. Deeds, in his testimony, said that it had been necessary to change the entire program at least twice because of developments in Europe, where the second battle of Verdun showed that a change of type was necessary.

The life of a battle plane used at the front seems, from the Verdun experiences, to be about two months, after which it is worn out and must be replaced with a new machine.

He said that the proposal to appropriate a billion dollars for the new airplane program is not an over-estimate of the needs of the service, and that this amount will be necessary for the program recommended by Gen. Pershing, and adopted by the War Department.

Col. Deeds stated that it has frequently been found difficult to secure materials even when priority orders are granted, and in reply to inquiry he said that when all branches of the Government are seeking priority orders confusion results.

He believes the time is coming when it will be necessary to seek priority over priorities in order to get the immediate necessities.

Probe Spruce Shortage

Major Charles R. Sligh, who was removed from the Aircraft Production Board, where he had charge of wood production, was one of the chief witnesses at the open sessions. Col. R. L. Montgomery, Chief of the Equipment Division of the Signal Corps, stated that Major Sligh was removed because heads of the service believed spruce production was delayed. Major Sligh stated that he was too accurate to satisfy the members of the Lumber Committee of the Council of National Defense, and he went into great detail to explain political angles and jealousies and also to make statements about the unwillingness of the larger lumber companies to co-operate with him.

He stated that the Weyerhauser lumber interests had a representative on the Lumber Board with whom he did not agree, and that the Weyerhauser company, although it had the requisite amount of spruce needed by the Government, refused to cut the timber because it would create a surplus of lumber and thereby cheapen the price.

He spoke disparagingly of Col. E. R. Disque, head of the new Spruce Production Committee, and stated that since Col. Disque was in charge spruce production had fallen from 4,000,000 feet per month to 2,000,000 feet per month.

He said that there was no system to the present spruce purchasing of the Aircraft Board, and recommended centralized buying and standardized grades. He stated that by the use of standardized grades, and particularly by using what he termed "Specification No. 1 Spruce," it would be possible to get 30 per cent instead of the present 15 per cent out of the logs.

He claimed that the Curtiss Aeroplane Co. was using about 465 feet of spruce to a plane now, following his recommendation for the use of "Specification No. 1 Spruce," as compared with 1000 feet to a machine prior to that time.

According to Major Sligh, England and France are using 2440 feet of spruce to the machine, and Italy is using only slightly less. Major Sligh stated that before he inaugurated the present purchasing system the Government was paying $200 per 1000 feet for inferior spruce, and that at this time, through his plan, it secures a superior grade for $105 per 1000 feet.

Cost of Airplane Spruce

He eliminated the brokers and dealt directly with the mills. He showed that only a short time ago airplane companies were paying a minimum of $140 per plane for spruce, and using an average of 1000 feet per plane, which is now reduced to an average of 600 feet. Major Sligh stated that the production of spruce was 2,000,000 feet in September, which he increased to 4,000,000 feet in November. Col. Disque, he said, took charge in October, and production decreased to 2,500,000 feet in December and 2,000,000 in January. He admitted that part of this decrease was due to the rainy season, but thought that the three thousand workers recently sent to the lumber districts by the Government should have offset the effects of the rain.

Major Sligh stated that 80,000,000 feet of spruce would be required to meet the plane-building plans for 1918.

Ex-Governor West told the committee that only 20 per cent of the required spruce was being obtained. He said that someone with authority and with experienced lumbermen as advisers was necessary as head of the Government lumber interests in the West. The aviation program, according to Mr. West, called for 11,000,000 feet of spruce a month, while in the past six months ended Dec. 31 only 13,500,000 feet had been produced.

Details regarding the engineering progress of the Liberty engine, and the changes of type and various tests, were all told in executive sessions, and none of this information was made public.

—

Airplane Spruce Supply Within 50 Per Cent of Requirement

WASHINGTON, Feb. 5—Howard E. Coffin, in conference to-day, stated that while the spruce supply for airplanes was not up to schedule, it was not as far behind as was stated last week in the Senate Committee hearings. He believes the supply is now within 50 per cent of the requirements, and will soon be increased to meet the demand.

—

Hardy & Co. Assign French Rights

COVENTRY, ENG., Jan. 25—Ed. J. Hardy & Co., makers of the Hardy flexible joint, have assigned the French rights to this joint to Messrs. Brampton Bros., Calais, France, makers of Brampton chains.

Chevrolet Car Sales Double in 1917

125,004 Sold for $62,638,303—General Motors Profits Greatly Increased

DETROIT, Feb. 2—Sales of the Chevrolet Motor Co. in 1917 amounted to $62,638,303 for 125,004 cars as against $32,306,295 for 62,522 cars sold the year before. This represents an increase of 99.8 per cent in the number of cars sold, and 93.9 per cent in the cash value.

These figures were given out in the preliminary report of the General Motors Co. The same report shows undivided profits for that company for the 5 months ended Dec. 31 of $15,000,000 compared with $11,238,984 in the corresponding period of 1916. This is figured before the deduction of war taxes. Results for the 5 months of 1917 and 1916 follow:

	1917	1916	Increase
Cars and trucks sold	89,901	65,893	21,008
Net sales	$94,500,000	$60,731,130	$33,768,870
Undivided profits	15,000,000	11,238,904	3,761,016

Ford Building for Drafting and Designing

WASHINGTON, Feb. 4—The Ford Building here will not be occupied by the Quartermaster Corps, as was first planned, but will instead be taken over by the drafting and designing branch of the Ordnance Department.

Will Map Truck Routes

WASHINGTON, Feb. 5—The pathfinder car of the Highways Transport Committee of the Council of National Defense starts this week mapping out army truck routes for the Government. The committee has already laid out an official route from Detroit to the seaboard and another from Buffalo to the seaboard; it is now proposed to tap every truck manufacturing point in the central west and pick out feeder lines to two great main highways running eastward.

The pathfinder will go as far west as the Mississippi river and will map routes from cities in Wisconsin, Illinois, Michigan, Indiana and Ohio. The car will be in charge of Raymond Beck, field engineer of the Highways Transport Committee; with the car will be Major W. D. Uhler, formerly State Highway Engineer of Pennsylvania and now connected with the Motor Transport Service of the Quartermaster's Department, and Captain E. B. Butchers, Brigade Engineer of the U. S. Engineers' Corps.

As each state line is reached a representative of the State Highway Department will join the car and proceed over the roads of his own state. When this trip is completed the Government will have four main highways forming connecting links between the great manufacturing centers of the country and the Atlantic seaboard.

Motor transports on their way to France will follow these routes and will carry cargoes to relieve freight congestion. The drivers will secure their training under service conditions and be better fitted for their tasks of driving when they reach the war zone.

Minneapolis Show Biggest of Year

MINNEAPOLIS, Feb. 4—The Twin City show, which opened to-day, is a real automotive show, and is bigger than the New York and Chicago exhibitions put together. On the opening day the crowds were so enormous that the box office facilities broke down, and the association officers had to take admission fees at the gate, and pass the people in without tickets.

The show is held in the Overland Building and there are nearly three miles of aisles. The exhibits are varied, and include not only passenger cars, but trucks, tractors and accessories for all three. Farm lighting and farm power machinery, as well as household appliances are shown. There is also one airplane on exhibit, and a big industrial section, including Red Cross and food administration booths. It is nearly a quarter of a mile around the building and the crowds make traveling slow.

One Sub-Chaser a Day from Ford

Highly Standardized Boats to Be 200 Feet Long—500 Tons Displacement

WASHINGTON, Feb. 5—The Ford Motor Co. is to manufacture submarine chasers at the rate of a completed boat a day. Word to this effect and additional information that the first vessel has already been started has been made public.

As is to be the case with the 150-foot vessels to be manufactured by the Elco Works, Bayonne, the brief description of which was given in AUTOMOTIVE INDUSTRIES last week, these sub-chasers which Ford will build are to be highly standardized products. They are to be 200 feet long and of 500-ton displacement. The boats will be fabricated largely of structural steel shapes by the progressive assembly method in Detroit and taken to the sea by way of canals and inland waterways. Power will be furnished by geared steam turbines. There will be nothing freakish about the boats or their equipment. The number of boats ordered has not been revealed.

Probe Airplane Plans in Senate

(*Continued from page* 334)

there is no industry which can be definitely called non-essential.

Interesting news dispatches of the last few days told that the Ford Motor Co. will construct U-boat chasers for the United States. The Ford method of building automobiles on the progressive assembly plan will be followed in the construction of the new boats, which Mr. Ford is said to have designed himself for the Navy. The fabricated parts of the boats will be assembled in sections.

It is planned to have the hull, corresponding to the frame of the motor car, move on a conveyor from department to department, gradually being completed and made ready for launching. The Ford U-boat destroyers will be launched on the Great Lakes and brought to the coast under their own power.

A misunderstanding at the Navy Department last week cost Mr. Ford some good publicity. Seeing the story of his new contract with the Navy in the morning papers he wired to the department for permission to give out in Detroit a complete story of his plans. In the absence of Secretary Daniels, Assistant Secretary Roosevelt, unaware that Secretary Daniels himself had given out the short news item, denied the permission.

The War Industries Board of the Council of National Defense, which controls the important divisions known as the Steel Products Section, Autcmotive Products Section, etc., faces either abolition or readjustment and modification, as a result of a reorganization in the War Department.

The work of the board is already curtailed by the appointment of Col. Palmer Pierce, as Director of Purchases, and E. R. Stettinius as Surveyor General of Supplies in the War Department. These appointments effect principally the purchasing, but leave the work of stimulating and directing production still to the War Industries Board.

Standardized Equipment Important

An interesting point in the standardization of trucks developed at the hearing of Secretary Newton D. Baker at the Senate Committee meeting last week, when Senator Weeks questioned Secretary Baker as to our motor transportation progress, and the secretary answered the accusation of procrastination by stating that "motor transportation is short in the American camps in Europe now for the reason that the production of standardized and interchangeable equipment is of the very greatest importance."

He also added that our standardized trucks are in quantity production now. And in reply to inquiry as to why many divisions were not temporarily with any standard make of trucks, he said, "Now the requirement is that every division should have standard equipment in operation. Instead of buying promiscuous and indiscriminate truck and motor equipment which would have to be discarded when the division actually went into operation, the plan is to supply them with standardized equipment when they need it."

Shortage of Gas Ties Up Detroit

Between 8000 and 10,000 Men Laid Off—Some Plants Are Entirely Closed

DETROIT, Feb. 3—Between 8000 and 10,000 men had to be laid off temporarily Saturday by a score of manufacturing concerns engaged in war work, owing to a shortage of gas. Conditions are so acute that unless the gas company receives the needed coal within the next 36 hours 100,000 or more workers will be compelled to remain idle, as nearly all the local plants will be short of gas by Monday night. Gas company officials, the fuel administration and the railroads are co-operating to bring relief as quickly as possible, but the situation is considered very serious by all.

This is best shown by the action some of the biggest plants here found it necessary to take, notwithstanding that they are doing war work and thus are entitled to preferential service in getting the supplies of coal, oil, etc.

At the Ford Motor Co. about 4000 men were laid off Saturday and 4000 more may be turned home again Monday unless sufficient gas is available.

Several hundred men were laid off by the Michigan Stamping Co. owing to the shortage of gas, and the amount of coal on hand will only last 4 days at the most.

At the Northway plant more than 100 men were laid off, and the information was given that the plant might have to be closed Monday.

The enameling and block test departments of the Hudson Motor Car Co. are said to have been closed and other departments may have to be shut down within the next 48 hours unless gas is obtained.

The Detroit Forging Co., the Detroit Vapor Stove Co., the McCord Mfg. Co., the Detroit Automobile Supply Co., and several others engaged in war work have closed all departments using gas.

These are merely a few of the most important concerns partly or entirely closed, but it is likely that there will be scores unable to continue operations next week unless gas and coal are available.

The coal situation is practically as acute as it was a week ago. The continual inclement weather has nullified efforts made to get coal to the city. Coal dealers and railroad men say that the men are willing to do their utmost to relieve the situation, but the severe weather is rendering outdoor work almost impossible.

—

Detroit Used Car Show a Success

DETROIT, Feb. 4—The used passenger car and truck show, promoted by the Detroit Automobile Dealers' Assn., and held in the Overland Building, is reported by the exhibitors to be a success. The show opened Feb. 2 and will continue all week. According to the management, there were more than 2000 visitors the first day, and many cars were disposed of. Practically every dealer in Detroit has space, and there are about 300 cars and trucks on exhibition. Admission to the show is free, and tickets are obtainable at all dealers and accessory stores, hotels and newspaper stands.

—

Renfro Edmunds & Jones Distributer

NEW YORK, Feb. 7—John F. Renfro, 1834 Broadway, New York, has been made eastern distributer for the Edmunds & Jones Corp., Detroit. The company makes equipment for Ford and Dodge Brothers cars, and Renfro will have charge of repairs and parts sales in connection with this work.

—

No Plain Lenses for Missouri Cars

ST. LOUIS, Feb. 4—The new state law which prohibits plain lenses on motor car lights became effective Feb. 1 and accessory stores had the most rushing week of their existence. There was a wild skirmish among car owners to find a market for the discarded plain lens but no outlet appeared and thousands of them went into the scrap heaps.

—

Oetting to Address Cleveland S. A. E.

CLEVELAND, Feb. 4—At the coming meeting of the Cleveland Section of the Society of Automotive Engineers to be held Feb. 15, O. W. A. Oetting, special engineer of the Willard Storage Battery Co., will give a paper entitled, "The Effects of Low Temperatures on Starting." The place of the meeting will be announced later.

—

Lane Heads Parker Rust-Proof

DETROIT, Feb. 6—C. W. Parker, president and founder of the Parker Rust-Proof Co. of America, has resigned as president but retains his seat on the board of directors. George F. Lane, formerly general manager, has been elected president, and a new board of directors consisting of eleven men instead of seven has been chosen. The new officers are: President, George F. Lane; vice-president, Joseph G. Johnson; secretary-treasurer, W. M. Cornelius. Directors include the officers and George D. Mason, William H. Beamer, Thomas Bronley, Jr., Harry Spere, C. W. Parker, E. J. Corbett, F. M. Beal and Fred M. Aldrich. An engineering office will be opened in Detroit.

—

Fire Visits Belle City Iron

RACINE, WIS., Feb. 4—Fire of unknown origin almost totally destroyed the main shop of the Belle City Malleable Iron Co., Racine, Wis., causing a loss of at least $100,000. The foundry proper was saved. The burned building was two stories high, 80 by 120 ft. in size, and contained the pattern shop and storage vaults, core room, machine shop and stock room. Reconstruction work will begin immediately.

Priority Regulations Broadened

New Class, for War Emergency Work, Added—List of Products Lengthened

WASHINGTON, Feb. 6 — Priority Order No. 3, which was issued Sept. 21 by Judge Robert S. Lovett of the Priority Board, has been slightly modified by Priority Circular No. 3 which has just been issued.

The circular defines the regulations of the previous order and makes it apply to all individual firms, associations and corporations engaged in the production of copper, iron and steel and in the manufacture of their products: of chemicals, cotton duck and woolen cloth, and all such other raw materials and manufactured products as the committee may deem necessary from time to time.

The original priority order applied only to the production of iron and steel and in the manufacture of their products.

Under the new regulations all orders and work are divided into four general classes, instead of three as heretofore. These four are:

Class for Emergency Work

Class AA, which is the new classification and which covers "only emergency war work of a special or urgent nature"; Class A, which covers other war work necessary to carry on the war, such as arms, ammunition, destroyers, submarines, airplanes, locomotives, etc.; Class B, which covers orders and work which, while primarily designed for the prosecution of the war, yet are of public interest and essential to the national welfare or otherwise of special importance; Class C covers all orders and work not covered in the other three classifications.

The new regulations do not change any priority orders previously issued. The rule of procedure from now on is that orders and work in Class AA shall take precedence over those in all other classes; orders and work in Class A precede those in Class B, and these in turn precede those in Class C. The circular states:

Priority Rules Explained

"The classification of an order simply means that it shall be given precedence over orders of a lower classification as may be necessary (and only such as may be necessary) to insure delivery on the date specified in the order. It does not mean that work should cease on orders of a lower specification or that the order should be completed and delivery made in advance of orders taking a lower specification if this is not necessary to effect delivery within the date specified. The one to whom a priority certificate is directed should make his own production plans so as to get the maximum of efficiency out of his operations, making all deliveries at the times contracted for, if possible, and where this is not possible, giving precedence to the orders taking the highest classification."

Fuel Situation Near Crisis

Detroit Plants Closing — Gas Company Has 2 Weeks Supply—Shutdown Feared

DETROIT, Feb. 5—The fuel situation is becoming more critical every day. The Maxwell, Paige, Chalmers and Studebaker factories will have to close to-day unless a supply of coal arrives. The Lincoln Motor Co., which is making Liberty engines, has enough coal to last 7 days; the Ford Motor Co. enough for 13 days, and the Packard Motor Car Co. has a 10 days' supply. Many homes in Detroit are without fuel and the weather is below zero.

The gas company has coal for only a few weeks. If no relief comes before that time every engine testing department, enameling oven and all other work depending on gas will have to be stopped.

The confiscation by the local fuel administration yesterday of 20 cars of gas oil and several cars of coal, consigned to industrial plants here and the diversion of them to the gas company's plant, has only slightly relieved the situation. According to H. P. Hood, in charge of the industrial department of the Detroit City Gas Co., the general situation is still very acute and it is more than likely that most of the gas-using departments of the local plants will remain closed for the next few days. The railroad companies are making a special effort to get a supply of gas tanks and coal to the city, and all the local oil companies are co-operating in this respect.

At the General Aluminum & Brass Co., if the gas supply should be cut off for 3 hours, the entire plant will probably have to be closed down.

—

DETROIT, Feb. 6—The fuel situation throughout Michigan is daily assuming more serious proportions. Many of the larger companies, including Packard, Paige, Studebaker, and a number of others engaged in important war work and employing thousands of men are living from day to day and borrowing fuel to keep from shutting down. None of these plants has more than 10 days' supply. The situation is so serious that schools are closing to-day for a two-week period. A contributory reason for the coal shortage is that the miners at Albion are on strike, tying up mines which supply 2,000,000 tons annually. Small towns throughout Michigan are appealing for help. In this city the supply of coal at the local gas company remains low, 1000 cars of coal consigned to Michigan being tied up in Toledo. It is expected that 600 of these cars will remain here.

—

22,000 Trucks for Ordnance

WASHINGTON, Feb. 5—The Ordnance Department is figuring on purchasing 22,000 Four-Wheel Drive and Nash trucks. It is likely the contracts will be let within the next three weeks.

—

Stimulate After-War Exports

WASHINGTON, Feb. 6—By way of facilitating and stimulating after-the-war export business, the War Trade Board has issued instructions explaining to exporters the method of using form X which supersedes all others and which must be filed for all shipments abroad.

Scope of War Board Outlined

Motorcycles, Cars, Trucks, Tractors, Gas Engines and Accessories Controlled

WASHINGTON, Feb. 7—By way of eliminating any confusion which may have existed concerning the activities of the Automotive Products Section of the War Industries Board, this section has made public a chart which reveals its many activities and responsibilities. The chart follows:

H. L. Horning (formerly Waukesha Motor Co.).
Coker F. Clarkson (formerly general manager S. A. E.).
A. B. Brown (Rochester, N. Y.).
George Adams (formerly Garford Motor Truck Co.).

MOTORCYCLES.

REMARKS: .....
.....
.....

WASHINGTON, Feb. 4.—Shown herewith is the standardized test chart which has been prepared by the United States Government for use in checking the specifications and assembly of the Class B military trucks. Some idea of the thoroughness of the checking may be gained by the minute scrutiny which must be given every part before the truck is finally turned over to the Government as being O. K.

In the production of these trucks the Government deals directly with the makers of the various parts, supplying the parts to the assemblers. In the case of the Class A and Class AA trucks, the Government will deal with the assemblers, who in turn will deal with the parts makers.

....., 19.....

TO THE QUARTERMASTER GENERAL, U. S. ARMY,
WASHINGTON, D. C.

1. I have carefully inspected the above numbered truck chassis and have found it to be in accordance with specifications.

2. I have passed same as efficient for service.

N. Y. Exports Drop 28 Per Cent

Truck Shipments for December Fall Off 50 Per Cent—Allies Buy Most

NEW YORK, Jan. 31—Exports of passenger cars, trucks and parts from this port during December amounted to $6,955,818, which is only 72 per cent of November exports. Most of the decrease, however, was due to the falling-off in the number of trucks shipped to the allies. In November, England alone received 971 trucks, whereas the total number shipped to all countries during December was 427. The total value of 2907 passenger cars shipped was $3,624,118, that of the 427 trucks was $1,046,687, and exports of parts amounted to $2,285,013.

Australia was the largest purchaser of passenger cars, with a bill of $296,718 for 297 cars, and Argentina came second with receipts of 265 cars valued at $212,815. In November, Russia bought the largest number of cars, but not a single one was shipped to her during December.

France bought 118 trucks, costing $540,520. England came next, with 101 valued at $287,300. Chile's purchases of trucks exceeded England's in number, but were of a cheaper grade, and the bill amounted to only $86,606.

Shipments to the allies amounted to 1/3 of the total, those to South America amounted to ¼ and those to England's colonies amounted to about 1/5.

—

May Prohibit Chrome Imports

WASHINGTON, Feb. 5—Chrome ore may soon be prohibited as a product to be imported in this country, or its importation may be largely reduced. The import trade in manganese and nitrates requires a large tonnage, which the Government needs for exportation of supplies to Europe, and in consequence the United States aims to reduce this tonnage and use the American bottoms engaged chiefly in imported chrome ore in the war zone service. This will probably seriously affect some of our large steel plants which are depending on Cuba and other points outside of the United States for ore, and in turn display its effect upon the industry's steel allowance.

—

KENT, OHIO, Feb. 2—Sales of the Mason Tire & Rubber Co. for the three months ending Jan. 31, 1918, show an increase of 700 per cent over the corresponding period a year ago. January sales were the largest in the history of the company for any one month.

N. A. C. C. Appoints Truck Committee

Will Help in Solving Freight Problems—Result of Truck Makers' Convention

WASHINGTON, Feb. 5—With a view to aiding the Government in breaking the present nation-wide freight congestion, the National Automobile Chamber of Commerce has just appointed a Motor Truck Committee for constant service in Washington. This committee was appointed as a result of the recent convention of motor truck manufacturers held in New York, Jan. 8, 1918.

At this gathering, which voiced the unanimous desire of the nation's motor truck manufacturers to co-operate with entire unselfishness in any Government measures, three men very closely allied with war activities pointed out the need for a motor truck committee.

These men were Christian Girl, Director of Production, Military Truck Division, Quartermaster Corps., U. S. A.; Hugh Chalmers, Automobile Industries Committee, and Roy D. Chapin, Chairman, Highways Transport Committee.

It was explained that the importance of the motor truck was constantly increasing, not only as a war factor, but as an immediately available medium dealing with the freight congestion.

The committee as organized recently includes George M. Graham, Pierce-Arrow Motor Car Co., chairman; Windsor T. White, president, White Co.; M. L. Pulcher, general manager, Federal Motor Truck Co.; David Ludlum, president, Autocar Co.; D. C. Fenner, Mack Motor Truck Co.

This committee will work largely with the Highways Transport Committee. This latter committee, of which Roy D. Chapin is chairman, has charge of the task of diverting traffic from railroads to the highways in order to restore normal distribution.

Through its direct touch with the motor truck industry and with shippers all over the United States, the Motor Truck Committee should be in a position to lend signal aid.

The committee will also be available to all other departments of the Council of National Defense or of the War Department for any service it may be able to render. It will also render to the manufacturers of motor trucks all over the United States such assistance as they may call for.

Temporary headquarters have been taken in the Ouray Building, Eighth and G Streets, N. W., Washington, D. C.

—

Grossman Not Affected by Bush Terminal Change

BROOKLYN, Feb. 6—The Emil Grossman Mfg. Co., located in the Bush Terminal Building, which was taken over by the Government, will not be affected, since the Government will use only the docks and warehouse part of the building.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Steel Industry Operating at Only 50% Efficiency

The steel industry of the country, according to the best data obtainable, is operating on a 50 per cent basis, and some plants at no more than 25 per cent. No decided improvement is to be expected for several weeks, so serious is the derangement of every part of the machinery of transportation both in raw and finished materials. Producers will be many days working out of the glut of their own output which now prevents any measurable increase in rolling mill operations. At some plants the situation is simply chaotic.

The pig-iron statistics for January give a measure of what the steel industry has suffered from the unparalleled weather and transportation conditions of the past month. Output fell to 2,411,768 tons, or 77,799 tons a day, against 2,882,918 tons in December, or 92,997 tons a day. January production was thus the smallest since May, 1915.

On Feb. 1 the number of active furnaces was 310, while on Jan. 1 it was 321 and on Dec. 1, 345. How repeated bankings have crippled operations appears from the fact that in May, 1915, only 200 furnaces were at work to produce 73,015 tons a day, whereas last month it took an average of 315 furnaces to produce 77,799 tons a day.

To-day's situation is much more discouraging than the January figures show. Severe cold suddenly swept down this week on the Middle West, the heart of the iron and steel producing section of the country, and for the first six days of February pig iron production has probably been at less than 50 per cent of capacity. In January it was at the yearly rate of 28,700,000 tons, while the total for 1917 was about 38,600,000 tons. To-day the rate is probably under 22,000,000 tons a year.

Costs have advanced prodigiously under the cumulative handicaps in every part of the industry, and the showing in this respect when iron and steel prices are officially considered in March will argue even more strongly against downward revision than the cost figures canvassed at Washington in December. Predictions of smaller pig iron and steel production in 1918 than in 1917 have already appeared.

A development affecting the business of export houses is causing them some concern. Foreign purchases not for Government account have been unrestricted as to price, but they have been hard to place owing to scarcity of vessel space. Now, apparently at the suggestion of Washington, considerable general French and possibly British buying may be put through as defense material by the foreign commissions at the capital.

A New Service

¶ Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

While bottoms may thus be insured, the so-called Government prices will undoubtedly obtain. Steel and equipment for a French railroad may be placed in this way.—*Iron Age.*

—

Mercer Bucks Snow In Overland Drive

CHICAGO, Feb. 1—Possibilities of delivering cars by road from factories on the Atlantic coast to points in the middle west, even in midwinter, were demonstrated last week by E. W. Schillo, Chicago Mercer dealer, when he completed a trip from the factory at Trenton, N. J., with the first of his 1918 allotment. His purpose was the dual one of saving a freight car for shipping Government supplies and also to give the car a thorough chassis test on the road. Almost the entire trip was made in deep snow and on portions of the road his car was the first vehicle which had traveled it for days. Schillo plans to drive the most of his allotment from Trenton to Chicago this season. The trip was started from the Mercer factories Jan. 15 in one of the standard roadsters and was finished Jan. 23.

—

Car Dealer to Sell Airplanes

CHICAGO, Feb. 4—Harry Newman, Maxwell and Chalmers distributer, has arranged to supply his customers with aircraft as well as roadcraft, and is the first motor car dealer to handle aircraft on a commercial basis. He is showing a plane of tractor type, but he cannot promise delivery until after the war.

—

Mutual Motors Plant to Be Auctioned

DETROIT, Feb. 6—The plant of the Mutual Motors Co., which formerly manufactured the Marion-Handley car, will be sold at public auction to-morrow in Jackson, Mich. The assets of the bankrupt concern are inventoried at $1,300,000. It is expected that the Jackson Munitions Corp. will be one of the bidders for the plant.

Coal Situation Acute Despite Shut-Down Orders

The cold wave which descended upon the country the first part of the week greatly interfered with railroad transportation and undid in large measure the good work which had been accomplished up to that time.

Throughout New England the fuel situation is acute, both as regards manufacturing and domestic consumption. A short temporary priority order secured at Hampton Roads in favor of this territory helped to a certain extent.

Railroads in many instances have but a scant supply of fuel, and in a few cases are enabled to operate only through the co-operation of connecting lines.

In New York City and vicinity, due largely to adverse weather conditions, coal is extremely difficult to obtain, and practically no stocks are on hand, particularly in the yards of retail dealers.

Efforts to secure river coal at Pittsburgh were temporarily successful, and it was thought that a large part of the city's difficulties had been surmounted, when a new cold wave struck that region and undid the work which had been accomplished in the shape of opening the lower pools of the Monongahela. The warm weather which had preceded the cold wave had, however, loosened up the car situation to a considerable extent and car supplies the first day or two of this week were better than formerly.

The coal trade in the Middle West is still operating under great difficulties imposed by the excessive snow-fall in the past few weeks. Traffic conditions are extremely bad, and mine operation is likewise.

From all over the country come reports of industries cleaning their bins of fuel, and in many cases being down to bare boards. Certain plants have been forced to shut down, while others are only able to keep running on a hand-to-mouth basis through special orders of the local fuel administrators. The domestic situation is scarcely less serious, and the suffering in homes is intense.

It is not believed that these conditions will permanently and entirely right themselves until warmer weather has relieved the adverse conditions under which the transportation of the country is now laboring.—*Coal Age.*

—

Blood Officers Re-elected

KALAMAZOO, Feb. 6—All of the officers and directors of Blood Bros. Co. have been re-elected. They are: President, L. H. Mattingly; vice-president, O. S. Cross; secretary-treasurer, R. G. Urch; directors, the officers and F. S. Chichester, L. L. Thompson and C. E. Parson.

Olds Chairman of Kardell Truck

ST. LOUIS, Feb. 4—R. E. Olds of the Reo Motor Car Co., has been appointed chairman of the board of directors of the Kardell Tractor & Truck Co. The principal factory of this company will be in St. Louis, and the engines will be manufactured in Lansing. Some tractors for southern use will be made at Oldsmar, Fla. The tractor will be styled "Four-In-One."

—

Harry Krause, formerly with the Wire Wheel Corp. of America, has been made assistant general manager in charge of production of the Splitdorf Electrical Co., Newark, N. J.

—

G. F. Knowles, sales engineer of the Federal Motor Truck Co., Detroit, is leaving for Washington, D. C., where he will handle sales engineering and all business of the Federal company with the government for the duration of the war.

—

Thomas S. Watson, president of the Thomas S. Watson Co., has received the commission of major in the Ordnance Officers' Reserve Corps. He left for Washington last week.

—

Major Frank R. Bacon, president of the Cutler-Hammer Mfg. Co., Milwaukee, formerly in charge of the New Haven (Conn.) District of the Ordnance Officers' Reserve Corps, has been transferred to Washington.

—

H. F. Harris has resigned his position as assistant branch manager of Willys-Overland Inc., New York., and on Feb. 15 will become industrial engineer of the Republic Motor Truck Co., Alma, Mich.

—

George K. Parsons has been appointed manager of the new Detroit branch factory of L. V. Flechter & Co. and will have charge of all factory sales. He was formerly national distributer of the Disco Self Starter Corp. and connected with the sales organization of the Ford Motor Co.

—

Kenneth Moller has resigned from the William Whitman Co., Inc., Boston, to enter Government service.

—

C. E. MacConnell has been added to the staff of sales engineers of the Hyatt Roller Bearing Co., Detroit. He was formerly advertising manager of the Detroit branch of the Goodrich Rubber Co.

—

M. D. Davidson has been appointed sales manager of the truck division of the Lau Iron Works Co., Youngstown, Ohio.

—

William H. Alexander, assistant general manager of the Marvel Carbureter Co., Flint, Mich., who was in charge of experimental work in the engineering department, has been called to serve in the aviation section of the Signal Corps.

—

William D. Paine, York, Pa., who has been Eastern district sales manager for the Saxon Motor Car Co. for the last 10 months, has been commissioned a captain in the Ordnance Officers' Reserve Corps and is awaiting his call to active service.

Men of the Industry

Changes in Personnel and Position

Botterill N. A. D. A. Vice-President

DENVER, Feb. 4—Tom Botterill, veteran motor car dealer, has been chosen Colorado vice-president of the National Automobile Dealers' Association to serve the unexpired term of Walter J. Haughey, who has resigned. Botterill is Pierce and Hudson distributer for Colorado and adjacent territory and Dodge dealer for Denver and vicinity, and Haughey is sales manager of the MacFarland Auto Co., Buick distributer for Colorado and Wyoming.

—

Ralph C. Smith has resigned as Eastern sales manager of the Reo Motor Car Co. to become sales manager of the Anderson Tire Mfg. Co., Washington, D. C.

—

William M. Crotty, for 7 years manager of the Chicago branch of the New York Lubricating Oil Co., has been appointed sales manager of the motor oil department of the Continental Oil Products Co., Chicago.

—

A. A. Lightfoot has been promoted from the position of Pennsylvania representative of the Marathon Tire & Rubber Co. to that of division manager at Chicago. He succeeds H. F. Smith, who has resigned.

—

V. K. McBride, former assistant sales manager of the Federal Motor Truck Co., has been appointed a captain in the Ordnance Department at Washington.

—

E. M. Sanders Dies

ST. LOUIS, Feb. 4—Ed. M. Sanders, for several years western representative of the Moon Motor Car Co., died suddenly of heart disease in Los Angeles, Jan. 26. Mr. Sanders formerly was in the motor car business in this city.

First Class AA ¾-Ton Trucks Practically Ready

(*Continued from page* 317)

is to enable the Post Office Department to use a slightly smaller engine, as the 42 hp. of the 4-by-5 cylinders is considered too large for ordinary post-office work. It may be said in this connection that the undefined rumors to the effect that the Post Office Department will not use any of the standardized war trucks certainly does not apply, at least to the Class AA job, since the Post Office officials and engineers were considered in its design and their recommendations incorporated into the construction laid out.

Aside from the large component parts which were shipped to each of the assemblies by the parts concerns, each assembler furnished a large number of small units such as the brake-rod assembly, clutch-pedal assembly, the fabric universal joint spiders, spring bolts and the like. The Willys-Overland company furnished 130 extra parts in all including spring bolts, pads, clutch and brake pedal units, bumper, draw-bar, etc., exclusive of the wiring system. The Maxwell company supplied a large number of forgings and the spring hangers. Each assembler himself provided small brackets, the spark and control assemblies and a thousand and one small parts which go to make up the completed vehicle.

Will Drive Trucks Overland

According to the plans made known at this writing, it is intended to drive each of the trucks overland to Washington. The Reo job has a Q. M. C. body made by the Auto Body Co., Lansing, Mich., and the Federal job a body made by the C. R. Wilson Co., Detroit.

It is expected that as soon as the vehicles reach Washington and undergo satisfactory tests similar to those performed on the Class A and B trucks, they will be ordered in large quantities. It is expected that the Medical Corps and perhaps the Post Office Department will place the initial orders.

The AA truck can be made in great quantities, and as an indication of the production which can be had with these trucks, Walter E. Flanders of the Maxwell company volunteered the information that his company could build 100 of the trucks a day provided a sufficient number of the parts were made available.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

Saginaw Malleable Co. Doubles Capacity

SAGINAW, MICH., Feb. 5—The Saginaw Malleable Co. will double its capacity to take care of war contracts by the installation of a new smelting furnace. This will add about 100 more workmen to the 250 already employed.

At the annual meeting of the company held this week the following directors were re-elected: E. J. Lobdell, Henry T. Robinson, George H. Hannum, James J. Kerns, Charles T. Kerry, W. J. Wickes, C. F. Drozeski, who will meet within a few days to elect officers. The present officers are: President and general manager, Charles F. Drozeski; vice-president, W. J. Wickes; treasurer, George H. Hannum, and secretary, Julius B. Kirby. It is probable that they will be re-elected.

—

Larger Quarters for Improved Gauge

SYRACUSE, N. Y., Feb. 4—The Improved Gauge Mfg. Co. has moved to a larger factory at Canal and State streets. The company will increase its production also.

—

Reliance Truck Starts New Plant

APPLETON, WIS., Feb. 5—The Reliance Motor Truck Co., formerly styled Racine Motor Truck Co., has started the construction of the first unit of its proposed new plant here. This will be 76 x 300 ft. It is expected that the work will be completed by May 15.

—

Farm Tractor Now Fond du Lac

FOND DU LAC, WIS., Feb. 5—The Farm Tractor Co., manufacturer of farm tractors and power machinery, has changed its corporate style to Fond du Lac Tractor Co. to avoid confusion arising from the former style.

—

Four Wheel Drive Truck Starts Work

WEBBERVILLE, MICH., Feb. 7—The plant of the Four Wheel Drive Truck Co., a company organized about 6 months ago with $50,000 capital, is now completed and the manufacture of the first 2-ton truck is under way. The officers of the company follow: President and assistant treasurer, Ashmon Catlin; secretary and manager, Frank Young of Webberville; vice-president, F. D. Welfare; treasurer, W. W. Thorbun.

—

Reed Mfg. Co. Elects Directors

KALAMAZOO, MICH., Feb. 7—At the annual meeting of the Reed Mfg. Co., maker of the Reed tractor and steel castings, the following board of directors were elected: Joseph E. Brown, H. C. Lutje, E. H. Smith, B. W. Raseman and J. E. Welborn, Kalamazoo, and E. E. Reed, Oakfield, N. Y. The officers are: President, Joseph E. Brown; vice-president, H. C. Lutje; secretary, J. E. Welborn, and treasurer, B. W. Raseman.

—

Service Truck Elects Officers

INDIANAPOLIS, Feb. 5—At the annual meeting of the Service Motor Truck Co., Wabash, Ind., last week a 3 per cent dividend was declared. Reports show a business of $3,500,000 for the year. Fred B. Walter was elected president of the company; Alex Pence, vice-president; Mole Cook, secretary, and Edward Bridges, treasurer.

—

Columbia Motors to Make Government Trailers

DETROIT, Feb. 4—The Columbia Motors Co., maker of the Columbia 6-passenger cars, has received a big Government order for trailers, with instructions to begin shipments to France as quickly as possible.

—

Detroit Aero Club Organized

DETROIT, Feb. 4—The National Aero Model Club has been organized here for the purpose of discussing aviation and solving airplane problems. The officers are: V. C. Babcock, president; A. H. Rembowski, L. Lindblom and E. L. Biechell, vice-presidents, and P. Van Ostenburg, secretary.

—

Capital Increases

SYRACUSE, N. Y., Feb. 5—The Smith Wheel Co., Inc., has increased its capital from $1,000,000 to $3,000,000 and will build several additions to its plant.

—

STOCKTON, CAL., Feb. 5—The Holt Mfg. Co. will sell 3968 shares of preferred stock for $396,800 and 5000 shares of common stock for $500,000, the proceeds to be used for the extension and improvement of its plant here and the one at East Peoria, Ill.

—

DECATUR, ILL., Feb. 7—The Comet Automobile Co. has increased its capital from $1,000,000 to $3,000,000.

—

UTICA, N. Y., Feb. 5—The Genesee Motor Car Co. has increased its capital from $5,000 to $100,000.

—

SYRACUSE, N. Y., Feb. 5—The Sanford Motor Truck Co. has increased its capital from $50,000 to $250,000.

—

CLINTONVILLE, WIS., Feb. 2—The Four Wheel Drive Automobile Co. has increased its capital from $1,000,000 to $2,000,000.

—

LA CROSSE, WIS., Feb. 5—The La Crosse Tractor Co. has increased its capital from $1,500,000 to $2,500,000. The company is working at maximum capacity with a force of 400 men. Within the last year it has doubled its output and is now making extensive additions to its plant.

New Companies Formed

Latest additions to ranks of Automotive Industries

Will Make Airless Tires

KITTANNING, PA., Feb. 6—The Triple Airless Tire Co., a new company capitalized at $500,000, will break ground for its factory next month. The plant will be on a 5-acre lot, and when in operation, 250 men will be employed and 500 tires manufactured daily. Officers have been elected as follows: President, M. Martin, who is also president of the First National Bank, Grove City; A. C. Heilman, vice-president; Fred Daugherty, secretary and treasurer. A. M. McManus, Eau Claire, Wis., has been appointed general sales manager, and the board of directors include Eli Diekel, Ed. Aiken and Sam Sherman.

—

Suelflohn & Seefeld Add "Co."

MILWAUKEE, Feb. 4—The Suelflohn & Seefeld Co. has been formed with $300,000 capital, to succeed the partnership business of Suelflohn & Seefeld. The company makes motor car supplies, accessories, hardware, etc. The incorporators are Gustave A., Henry F. and Clarence A. Seefeld.

—

Super-Size Cord Tires Coming

INDIANAPOLIS, Feb. 5—A company headed by P. P. Parker is being organized here to manufacture super-sized cord tires exclusively. The company will be styled Parker Tire & Rubber Co. The organization of the company is well under way. The plant will be located in Indianapolis.

—

Dividends Declared

The Standard Oil Co. of New York has declared the regular quarterly dividend of $3 a share, payable March 15 to stock of record Feb. 21.

—

Four Wheel Drive Automobile Co., Clintonville, Wis., at its annual meeting declared a stock dividend of 50 per cent. The company is filling a contract for Government military trucks involving about $50,000,000. The dividend increases the capital stock of the corporation from $1,000,000 to $2,000,000. A year ago the capital was increased from $500,000 to $1,000,000. At the meeting J. D. Cotton was elected a director to fill the vacancy caused by the death of John Kalmes, treasurer, several months ago.

—

The Union Carbide & Carbon Co. has declared a dividend of $1 a share on its 3,000,000 shares of common stock, payable April 2 to stock of record March 9.

India Now Good Motor Vehicle Market

High Freight Rates and 82 Cent Gasoline No Deterrent—Big Export Field Opening

BOMBAY, INDIA, Nov. 28, 1917—There is a great demand for automobiles of all kinds in India at present, in spite of the high cost of gasoline, which averages 82 cents a gallon. A government act of 1916 prohibits the importation of motor cars, motorcycles and trucks except for use of the government and persons who have special licenses, but this act will be repealed as soon as the war ends.

Consequently, an unprecedented importation of motor vehicles is expected, not only because the present supply is far less than the demand, but also because native merchants are enjoying a period of prosperity. In addition, the population of India, and Bombay in particular, is increasing rapidly, and the present means of transportation are inadequate.

On account of the great demand and high freight rates prices are high. A Ford car sells for the equivalent of $1,100 and the Scripps-Booth 2-passenger, advertised for $935 in the United States, brings $1,600. Freight, which costs $123.28 a ton via New York and the Asiatic or City Lines to Bombay, naturally hurts the cheap car more than the expensive one.

Streamline Bodies Popular

Residents of Bombay who are in the market for passenger cars prefer the streamline, torpedo body. French gray is the most popular color, with dark shades a close second. Many natives like gaudy colors and have their cars painted to suit themselves. As a result, some startling effects of combined blue and scarlet, orange and black, peagreen and lavender and pink and sky-blue may be seen here.

Cars should have a one-man top, covered with good waterproof khaki, as the monsoon rains beat their way through an ordinary top leather upholstery and brass trimmings are best. The native helper loves any work which he can perform while sitting down and will polish bright work by the hour. As little discretion is used in the selection of a polish, a nickel finish will soon disappear.

Most people in India prefer the touring body, and if there are extra seats these should face the rear seat. The latter, to please the native, must be wide and low, with deep upholstery.

Two Brakes Necessary

The motor laws of Bombay require two brakes, hand and foot, on the rear wheels, two head lamps, tail lamp, and side lamps which throw light on the center of the front fenders. Headlights must be dimmed for city driving and no mechanical or electric horns may be used. In spite of the fact that the left-hand drive is customary in England, India prescribes the right-hand drive, although there are a few instances of left-hand drives being permitted by the police.

In regard to engines, the 4-cylinder engine, 15-20 h.p., with detachable head and overhead valves, is most used. Gear boxes should be separate units and installed in the middle of the chassis. High-tension magnetos are demanded and electric starters are coming into vogue, as most dealers have fully-equipped repairshops and can take care of electric equipment.

Small Gear Ratios

Bombay's topography makes small gear ratios, from 3½-1 to 4-1, necessary, and normal tread cars with chucker tires in metric sizes are most desired.

At present 1½, 4 and 6-ton trucks are popular, the two larger sizes being used for the transport of cotton. These have chain drive and the smallest size worm drive. As Bombay is very hot, extra large radiators with fan and pump are necessary. Tail and side lamps are required, the latter used to show as far as possible the width of the car, which is limited to 6 ft. 7 in. Trucks should have demountable, solid tires.

At present there are 12 agencies in Bombay carrying 19 American cars and 4 American trucks, and 11 agencies for 23 foreign cars and 5 trucks. Seven makes of tires are sold, each by a separate agency.

The complete list follows:

American Cars

Name	Agent
Overland and Willys-Knight	A. Hyland
Briscoe	A. H. Wheeler & Co.
Chevrolet and Oakland	Bombay Garage
Ford	Ford Automobiles, Ltd.
Pullman	Omiar Motor Works
Metz	L. Roysampat
Buick and Saxon	Hill, Sawyer & Co.
Studebaker	French Motor Car & Electric Co.
Moline-Knight,	French Motor Car & Electric Co.
Hudson and Regal	Bombay Motor Car Co.
Dodge	Bombay Cycle & Motor Agency
Scripps-Booth, Chalmers and Maxwell,	The Automobile Co., Ltd.
Oldsmobile	Hormusji Sorabji

Trucks

War Trade Board Issues New Rulings

WASHINGTON, Feb. 1—American corporations, established and doing business in neutral or allied countries, have been authorized by the War Trade Board:

1. To receive in payment of indebtedness, and to collect drafts or checks drawn or endorsed by "enemies" or "allies of enemies" where refusal to accept the same may result in failure to collect the debt.
2. To pay drafts or checks drawn in favor of, or endorsed by, "enemies" or "allies of enemies" where refusal to pay the same will result in a violation of law or commercial obligation;
3. To receive for collection drafts or checks drawn by, or accepted, or endorsed by "enemies" or "allies of enemies;" and
4. To become a party to clearing house transactions in the ordinary course of business where an "enemy" or "ally of enemy" may be a member of such clearing house.

Report Each Transaction

A written report of every such transaction of trade with the "enemy" or "enemy allies" shall be mailed to the War Trade Board, Wahington, D. C., on the fifth day of each month, covering the transactions of the preceding calendar month under 1, 2 and 3 above. Such report must state the dates of the respective transactions, the respective names of the drawers, drawees and endorsers, and the respective amounts of the drafts and checks involved. Any United States corporation or other American house joining a clearing house under 4 above shall immediately mail to the War Trade Board, Washington, D. C., a statement of the facts in the case.

Likewise the War Trade Board has authorized branches of American corporations and other American houses established and engaged in business in neutral countries, or in countries associated with the United States in the war, in cases where a lease has been made without knowledge of the "enemy" character of the tenant or landlord, as the case may be:

1. To receive rent from "enemies" or "allies of enemies" where refusal to accept the same will result in failure to collect the debt;
2. To pay rent to "enemies" or "allies of enemies" where refusal to pay the same will result in forfeiture of the lease or damages.

A report of every such lease shall be mailed to the War Trade Board, Washington, D. C., after the discovery of such "enemy" interest. Such report shall state the date when the lease was made, the date when the lease expires, the amount of rental payable, the name or names of the "enemy" tenant or landlord, as the case may be.

11 More Michigan Plants Exempted

LANSING, MICH., Jan. 31—In addition to those concerns previously exempted from the closing order in Michigan on Monday of every week until further notice, State Fuel Administrator W. K. Prudden has announced further exemptions. These include the Champion Ignition Co., Flint; Hayes Motor Truck Wheel Co., St. Jones; Jackson Motor Shaft Co., Jackson; Mason Motor Co., Flint; Muskegon Motor Specialties Co., Muskegon; Keller Brass Co., Grand Rapids; Lewis Spring & Axle Co., Chelsea; Jackson-Church-Wilcox Co., Saginaw; General Motors Co. and the Weston-Mott Co., Flint, and the Republic Motor Truck Co., Alma.

Hartford Auto Parts Elects Directors

HARTFORD, CONN., Feb. 3—At the annual meeting of the Hartford Auto Parts Co. last week the following directors were elected for one year: J. H. Trumbull, Trumbull Electric Co., Plainville, Conn.; C. C. Chamberlain, Blakeslee Forging Co., Plantsville, Conn.; H. H. Ensworth, L. L. Ensworth & Sons Co., Hartford, Conn.; M. J. Unkelbach, Unkelbach & Perry, architects, New Britain, Conn.; J. M. Carney and H. W. Bigelow, Hartford Auto Parts Co. The old board of directors was re-elected at the meeting and the regular quarterly dividend of 1½ per cent, payable Feb. 15, was declared.

AA Truck Assemblers to Deal with Parts Makers

WASHINGTON, Feb. 2—The Motor Transport Section of the Quartermaster Corps plans to issue contracts for the assembling of Class AA trucks in a manner similar to that used for the assembling of Class A trucks. This means that the assemblers will deal directly with the parts makers.

Airplane Production Offices in Cleveland

WASHINGTON, Feb. 2—Major Harry Shepler, formerly vice-president of the Willys-Overland Co. and now in charge of production for the aviation section of the Signal Corps, is moving his offices to Cleveland and will have charge of government aviation production. In Cleveland he will better be able to supervise airplane work, as a majority of the factories are located in that section.

Unite to Clear Roads

LANSING, MICH., Feb. 5—The Olds Motor Works, the Reo Motor Car Co., and the Auto Body Co. have joined hands, at least temporarily, to form what might be called a snow-shoveling brigade. More than 100 men are now occupied in clearing the roads from Lansing to Detroit, so that cars and bodies may be shipped overland to Detroit and then connect with the military motor truck road from Detroit to Cleveland and Toledo.

Shipping conditions during the last 10 days have become so acute that these concerns had to lease warehouse space, as their plants were being filled with the finished product, which could not be shipped. A few days ago the Reo Motor Car Co. leased part of the Owosso Sugar Co. plant to store 200 trucks and cars. At the Olds Motor Works it was stated that it is not possible to get freight cars and owing to the bad weather passenger cars can hardly be moved by the usual driveway plan. The Auto Body Co., which is furnishing bodies to the Scripps-Booth Co. of Detroit, is also unable to make shipments. It is for these reasons that these companies have combined.

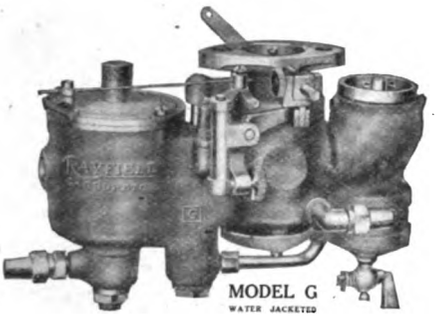
BERGIE
National
SPARK PLUGS

The Spark Plug
With the One Inch
Firing Surface

A Spark Plug that stands the test of Tractor Service—

will meet superlatively the ignition requirements of any passenger car or truck. Low speed tractor work with kerosene the common fuel—is the supreme spark plug test.

NATIONAL SPARK PLUGS are used exclusively by constantly increasing thousands of tractor owners. Try a set this winter on your passenger car and you will learn the reason.



Ideal for easy winter starting, 7 to 10 fat hot sparks insure quicker, surer explosions—a better operating motor under all conditions.

Sold on 30 Days' Trial. Price $1.00 each for all cars. Order of your dealer, or direct if he cannot supply you.

Write for unusually interesting dealers' proposition.

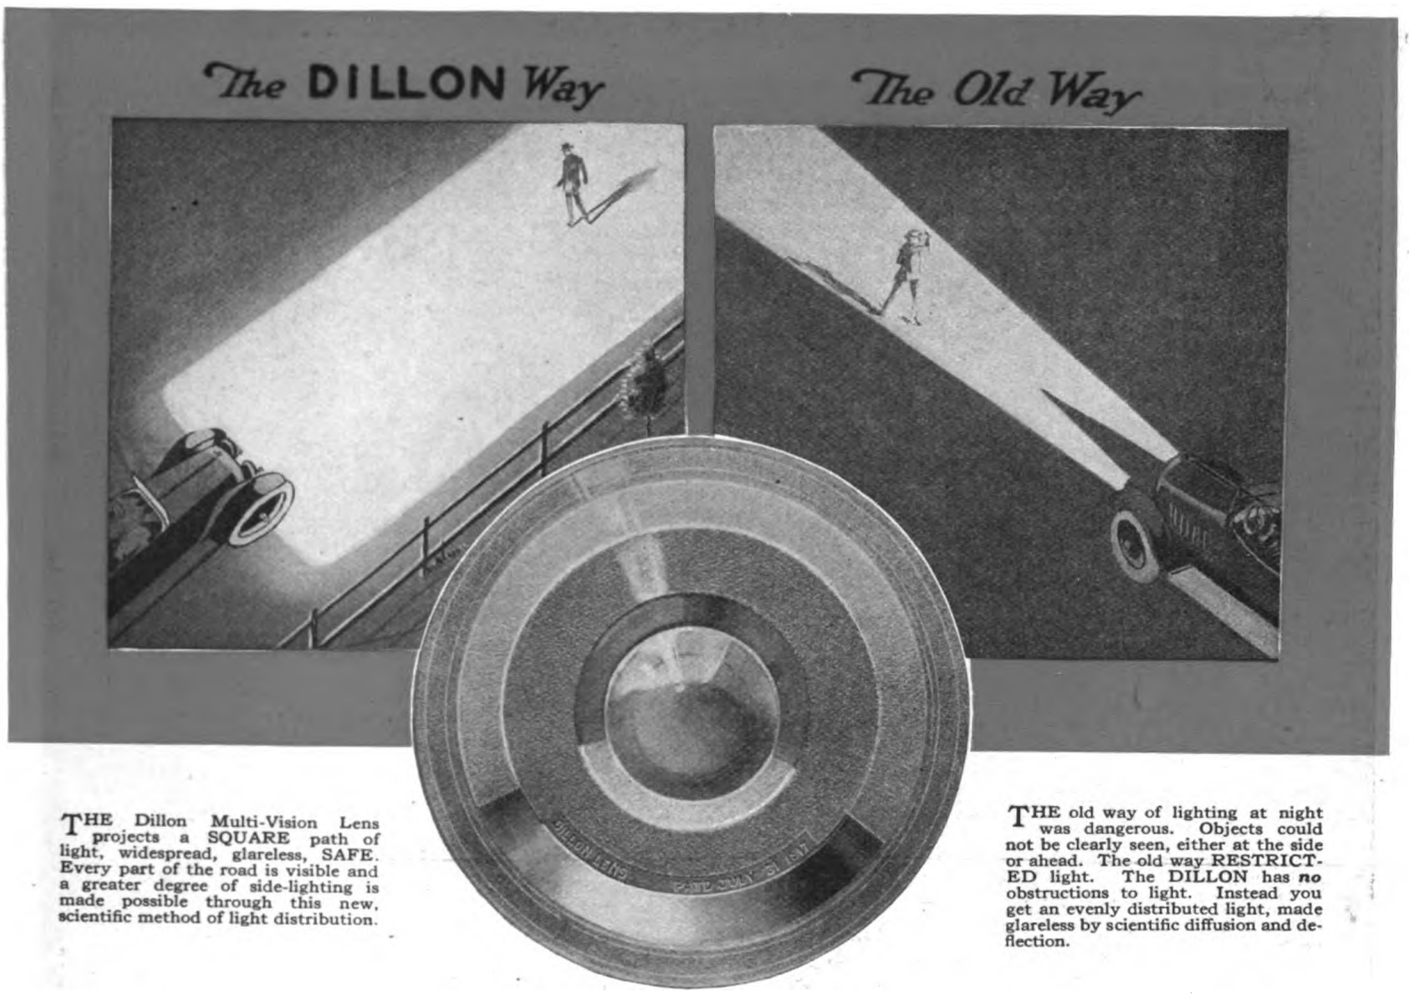
THE Rayfield is acknowledged to be the best carburetor on the market today.

It is best for all makes of cars.

It is best with all grades of fuel.

It is best in all kinds of weather.



Severe winter driving demonstrates Rayfield superiority. Poor carburetors are at their worst during zero spells.

How has your carburetor been serving you this winter?

THE Dillon Multi-Vision Lens projects a SQUARE path of light, widespread, glareless, SAFE. Every part of the road is visible and a greater degree of side-lighting is made possible through this new, scientific method of light distribution.

THE old way of lighting at night was dangerous. Objects could not be clearly seen, either at the side or ahead. The old way RESTRICTED light. The DILLON has *no* obstructions to light. Instead you get an evenly distributed light, made glareless by scientific diffusion and deflection.

Which will you choose?

Why risk your safety, why not ASSURE it? Why drive the old way, why not the DILLON way?

The Dillon Multi-Vision Lens answers the question. Once you have ridden behind it, once you have given it a thorough test under all conditions, then you will be glad you chose the Dillon way of night-motoring.

Only the Dillon can give you a SQUARE path of light, only the Dillon can guarantee you TWICE the lighted area, only the Dillon will give you ALL the light you need without glare.

The Dillon makes driving at night as safe as by day. Legal in city or country. Will not break from contraction or expansion. Sold everywhere for $3.50 a pair, any size. Write if your dealer cannot supply you.

MANUFACTURERS: *Which will YOU choose? Inefficient lenses which bring discredit to you as a manufacturer, or the Dillon Multi-Vision Lens, the SAFEST lens in America, which adds to the prestige of your car. The Dillon is being made known nationally. Have your engineers test a pair. Write.*

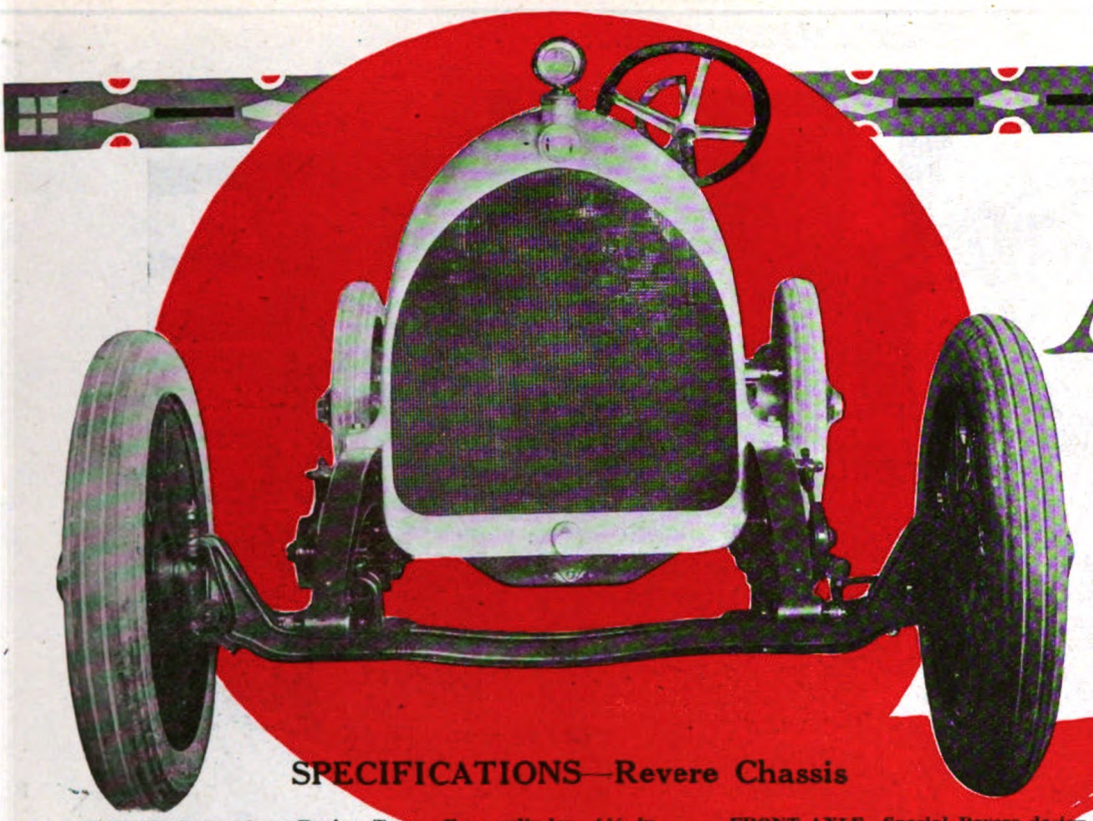
Increase the Value and Usefulness of Your Trucks by Equipping them with the

OTIS POWER WINCH

What hitherto was accomplished with much labor and the expense of much unnecessary time is now made possible to accomplish swiftly and easily through the use of the Otis Motor Truck Power Winch.

Trucks which hitherto have been used as merely a means of transportation are transformed by the installation of the Otis Power Winch into an elevating, self-loading machine.

The Otis Power Winch can be utilized in numerous practical and effective ways. Good business prompts one to get the utmost efficiency and value from every investment, and your trucks will not be attaining their maximum of utility until they have been equipped with the Otis Power Winch.



Keep abreast of the times by sending in at once for full information. All particulars with illustrative data will be furnished upon request.

An

Duesenberg Racing Type Motors. Used in all REVERE CARS. Speed from 4 to 85 miles an hour — 130-inch wheelbase

SPECIFICATIONS—Revere Chassis

ENGINE—Duesenberg Racing Type. Four-cylinder, 4½ in. bore, 6 in. stroke. Develops 103 H. P.

Cylinder—Gray iron and aluminum, cast en bloc.

Crankcase—Aluminum, crankshaft chrome nickel steel, finished all over, counter balanced.

Connecting Rods—Drop forged, heat treated chrome nickel.

Pistons—Special aluminum alloy. All integral moving parts hardened and ground; tungsten steel valves. Oiling system, pressure feed and splash.

Magneto—Bosch high tension.

Clutch—Multiple dry disc; discs faced with non-burn composition.

Starting and Lighting System—Electric Bijur.

TRANSMISSION—Revere design. Four speeds forward and one reverse. Direct drive on fourth. Unit power plant.

Gears—Special alloy steel, hardened and ground on bearing surface; shafts on large ball bearings.

Transmission—Supported on three points, assuring absolute alignment of engine and transmission, drive to rear axle through two universal joints; torque taken up through two rods each side of propeller shaft.

REAR AXLE—Full floating type, spiral bevel gears.

FRONT AXLE—Special Revere design, drop forged.

Knuckles—Extra heavy drop forged chrome nickel steel knuckles and steering connections, all tested to 100,000 pounds, elastic limit, all steering joints ball adjustable type, short turning radius.

FRAME—Special Revere design front and rear kickup.

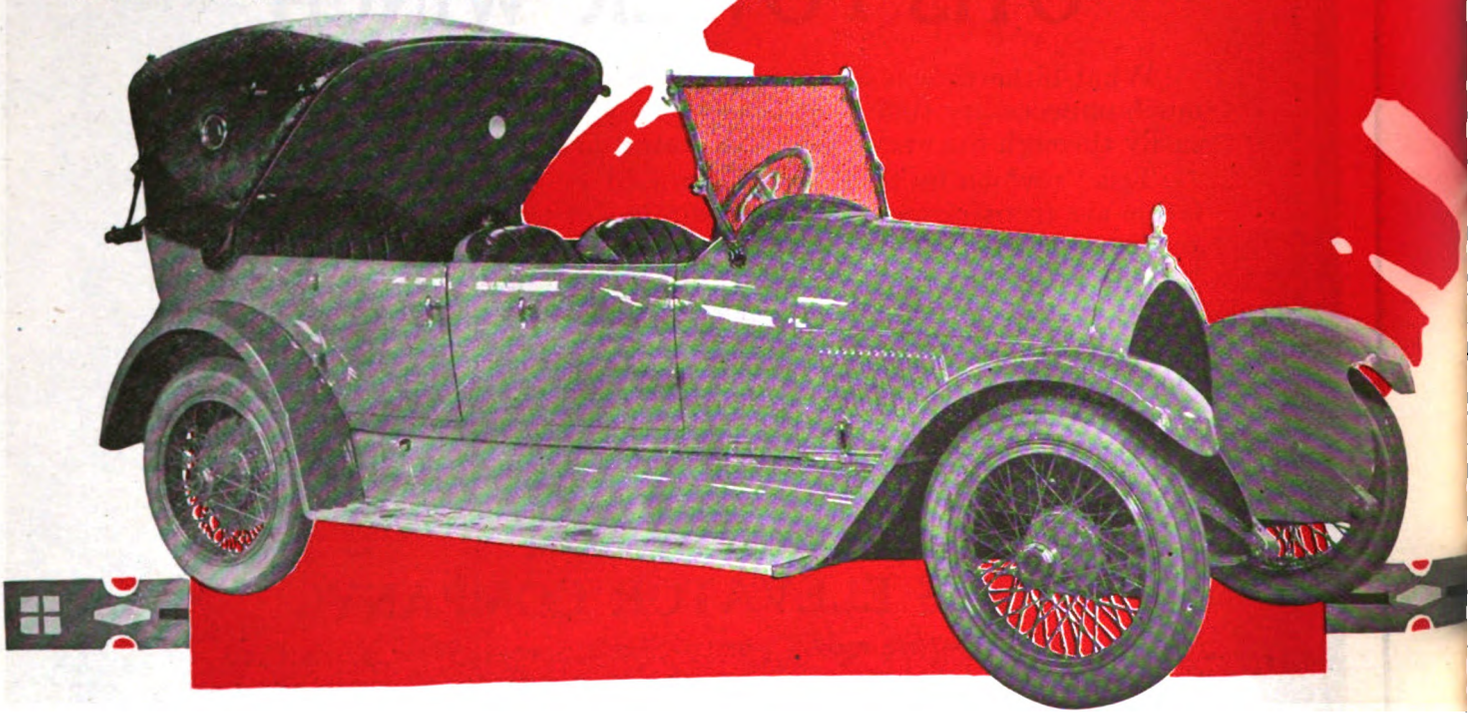
SPRINGS—Silico manganese special alloy steel, heat treated.

Front Springs—Semi-elliptic.

Rear Springs—Special Revere design, very long, 58 inches long, 2½ inches wide with rebounding springs.

STEERING GEAR—Worm and gear type, all gears and shafts hardened and ground and adjustable for wear, in all directions. Special Revere design spark and gas control.

CARBURETOR—Miller or Stromberg.



RADIATOR—Exclusive Revere design, honeycomb type, mounted in aluminum shell.

WHEELS—32x4½ wood or wire wheels. Tires 32x4½ Goodyear Cord.

WHEELBASE—130 inches.

BODY—Speedsters, six-passenger Touring Car and four-passenger Sport style.

Car Complete, $3500—$3850 f.o.b. Logansport, Ind.

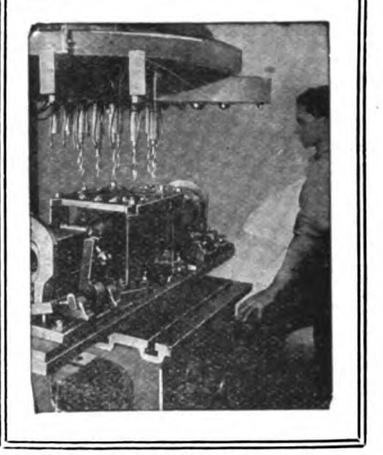
Ready demountability of Sheldon wheel hub. Remove parts A, B, and C, replace B (hub cap), insert E (set screw), and screw against shaft. Tap back of wheel G till it comes loose.



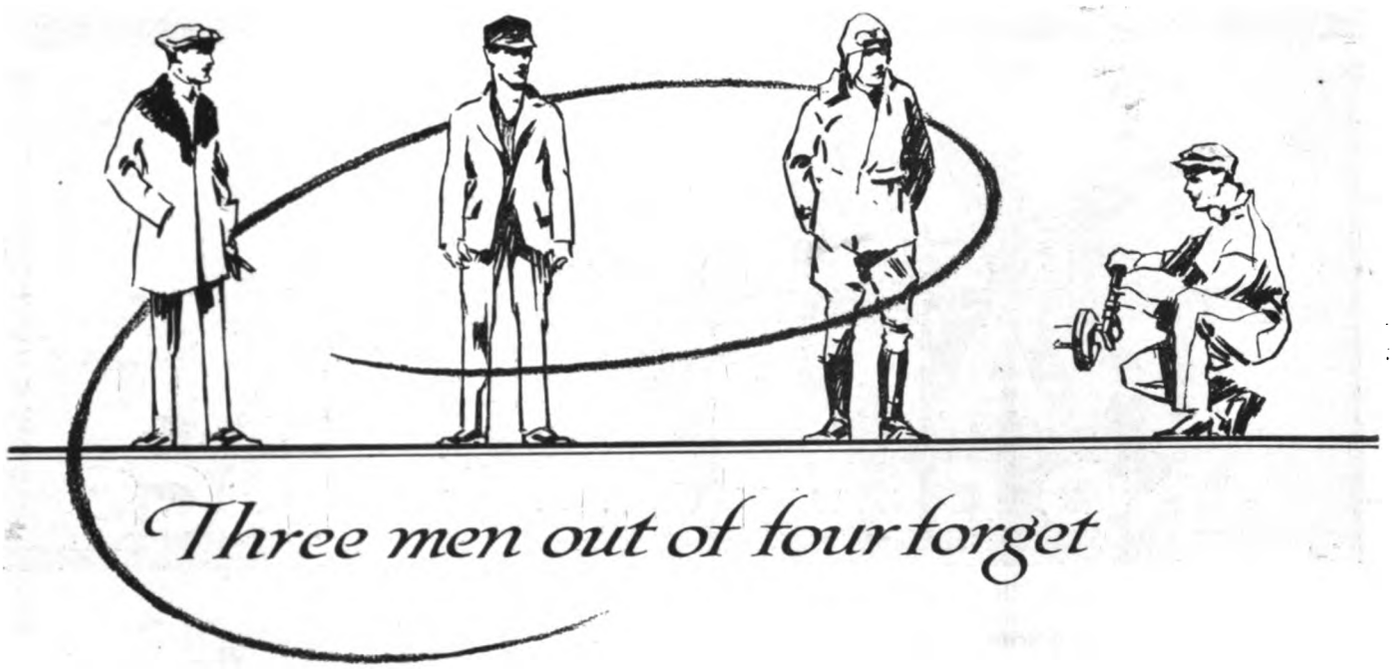
This Giant Wheel Can Be Quickly Removed

from the Sheldon Worm Gear Axle. There are only six simple operations necessary and these can be performed in a few minutes by an ordinary workman.

Most large truck users insist that, as a matter of precaution, the rear wheels be removed frequently for inspection. This is accomplished with the utmost facility on the Sheldon Axle and without exposing the ball bearings to dirt and grit because they are completely enclosed.

Sheldon Worm Gear Semi-floating Rear Axles are the highest possible expression of service and utility.

Write for complete details.



Drilling 12 stud holes at once in a worm-gear axle housing.

IT is important to remember that the service life of a car, and in fact machinery of all types, is determined by the life of its bushings.

It is likewise important to remember that the service life of a bushing is determined by the amount of proper lubrication is receives.

Experience proves that three out of four drivers of cars, or operators of machinery, forget or neglect to lubricate the most important bushings.

The reason is that many of these bushings are hidden in out-of-the-way places that are difficult or impossible to reach.

For this reason far-sighted manufacturers of trucks, passenger cars, and builders of machinery of all types use Genuine Graphited Oil-less Bushings in these out-of-the-way bearing places most liable to neglect. In this way they safeguard and prolong the service life of their products.

Should you neglect an *oil-less* bushing, no harm will result. Its efficiency or service life will not be affected. It is *self* lubricated. It represents a form of insurance against neglect and quick wear.

We also manufacture Nigrum (Impregnated hardwood) oil-less bushings.

BOUND BROOK OIL-LESS BEARING COMPANY

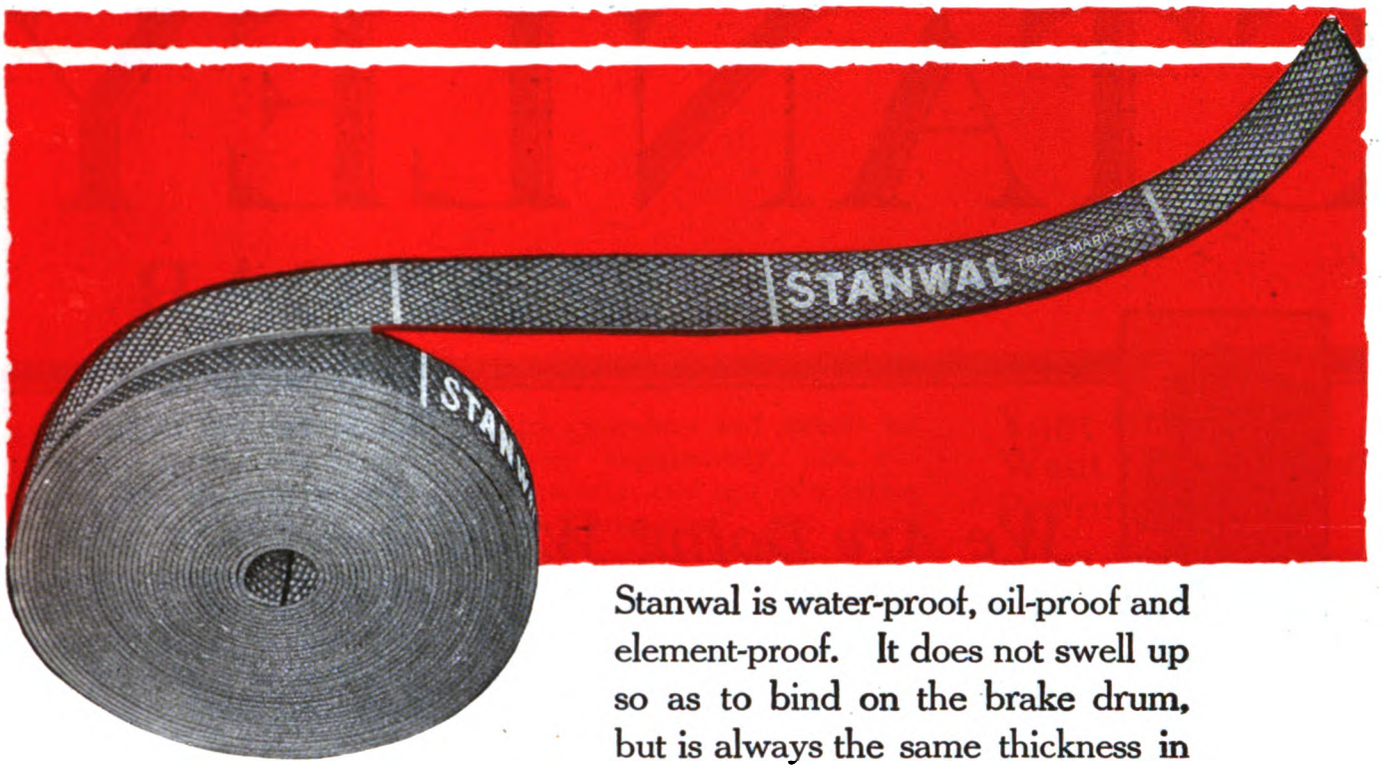
STANWAL
BRAKE LINING
AND CLUTCH FACINGS



STANWAL marks a distinct advancement in manufacture. It is an engineering achievement — an invention which has revolutionized the quality of brake linings for pleasure cars and trucks.

Tested by impartial experts, Stanwal is pronounced perfect in performance. It withstands the frictional heat generated in the brake drums under any conditions of service.

Stanwal will not absorb moisture. It is unaffected by oil and water. It is noiseless under severe pressure. It averages a plus 25 per cent wearing quality.

Please mention Automotive Industries when writing to Advertisers

Digitized by Google

Stanwal is water-proof, oil-proof and element-proof. It does not swell up so as to bind on the brake drum, but is always the same thickness in relation to the brakes.

STANWAL improves with use. This is made possible by the exclusive, scientific treatment which is given to every foot. As a result of this treatment a high frictional quality is given to the fabric, and as the frictional pressure is applied the heat-resisting quality increases.

STANLEY

STEAM 22nd year CAR

The Power That Moves the World

We Are Doing What All Other Makers Are Struggling in Vain to Do

We are making a car which runs with a soft, smooth, gliding motion —without any noise or vibration at any speed—without any shifting of gears—and with a driving power which is absolutely uniform and continuous—and whose fuel is kerosene. But far beyond that, we are doing

What No Other Maker Is Even Attempting to Do

We are delivering this absolutely uniform and continuous driving power without any gears to shift, without clutch, flywheel, carburetor, ignition system or self-starter, and without any substitute devices to perform the functions of these. The functions themselves are simply not a part of the Stanley car. And we are doing it with

Only 32 Moving Parts in the Complete Vehicle

—with only two cylinders, with only 894 revolutions a minute at sixty miles an hour, and with no controlling device whatsoever except a finger throttle. There is absolutely nothing for the operator to do to control the speed of his car except to move this finger throttle forward and back on its quadrant, and apply the brakes. This is the ideal performance that you have been longing for.

Other makers have recognized your longing, and have made honest endeavors to achieve the ideal. But the limitations of the internal explosive engine are such that to adapt it to a self-propelled road vehicle means the interposition between the engine and the driving wheels of a clutch, a flywheel, a gearshift and a transmission; and without any possibility of storing power except in the flywheel.

It means trying two, four, six, eight and twelve cylinders; it means trying electric gear shifts, electric final drives, friction drives, two-speed rear axles, over three thou-

Digitized by Google

sand engine revolutions and upwards of thirty thousand piston revolutions a minute.

Makers of multiple cylinder cars, recognizing the fundamental superiority of steam for self-propelled road vehicles, have advertised that their cars were "almost as flexible as steam."

The Ideal Performance of the Stanley is based on three fundamental facts. First, the engine is geared directly and permanently to the differential; the engine speed is the same as the car speed; there is no such thing as shifting gears, and therefore no such thing as a clutch or a flywheel and no such thing as disconnecting the power from the load; to "change speeds" you merely admit more steam to the engine.

Second, the steam enters the cylinders and exerts its force expansively, not explosively, and not in a series of "impulses," not even "overlapping impulses," but in a smooth, continuous torque on the crankshaft, which means a constant flow of driving power.

Third,

The Fuel, Which Is Kerosene

is converted, not into mere instantaneously dissipated power, but into steam, which is stored in advance in great abundance, and can be instantly applied to the driving wheels by merely opening the finger throttle, without waiting for the power to be built up into a flywheel, and which delivers its very maximum of power under the most adverse conditions.

Your Customers Want This Wonderful Performance

—they would want it, even if it were achieved by the addition of still more contrivances to their present conventional car. How much more, then, do they want it if it is achieved by eliminating all those hardships and handicaps which have been most fearsome to them?

Ride in a Stanley—drive it yourself. Then and then only can you realize what this Stanley performance means to experienced motorists.

You don't want to miss getting your customers *exactly what* they have been longing for by overlooking the Stanley, do you? We shall be glad to hear from you, and to send our booklet.

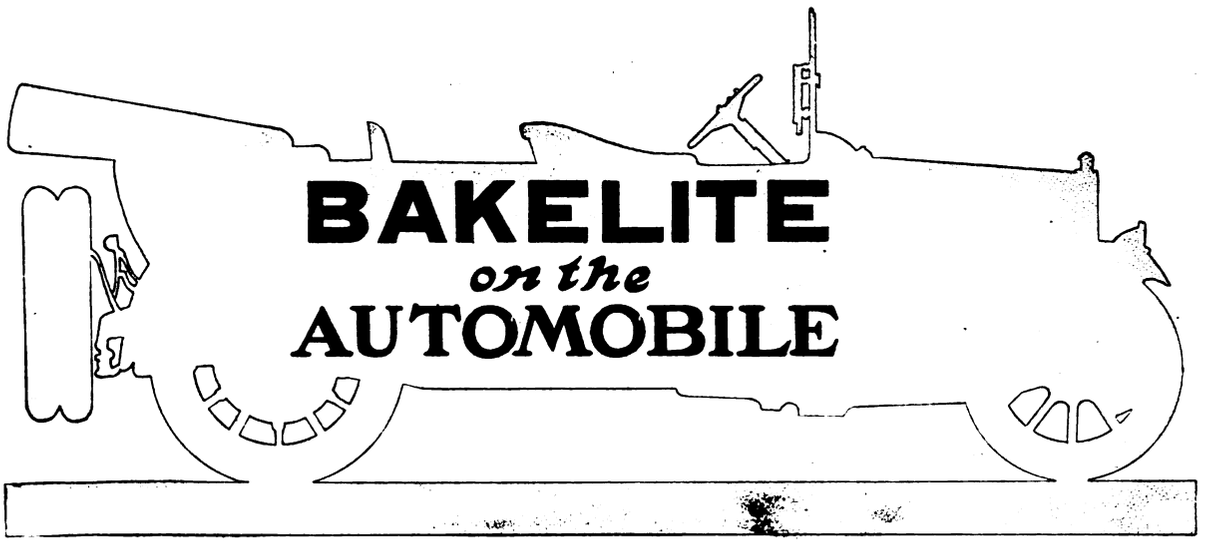
Many Kinds of Economy With Firestone Tubes

ONE of the strongest factors for extra measure of tire mileage is the protection given the casing by the enduring liveliness of the Firestone Red Inner Tube. It is built, layer on layer, by the laminating process, into one integral unit of endurance against heat and grind. This tube means for the man who sells it, the lasting economy and long-time dividends of good will.



Firestone Red Tubes sell best because they serve best. The prices are eye-openers on all the Firestone values. The facts will be plain to any motorist who buys Tire Accessories. If a Firestone Tube, which anybody can judge on sight, can be so good and yet sold so low, Firestone Tire Economy must be a fact.

Write for the Firestone sales-helps.

BAKELITE *on the* AUTOMOBILE

Good Places for BAKELITE

Bakelite has proved an unqualified success in the automobile field because of an unusual combination of qualities possessed by no other material.

Bakelite is ideal for Steering Wheels, Dial Plates, Radiator Caps, Distributors, Commutators, and other parts of Electric Starting, Lighting and Ignition Systems.

BAKELITE

Is not affected by heat.

Is mechanically strong and chemically inert.

Is not affected by water, steam, oils, solvents, or ordinary chemicals.

Automatically assumes a polish in the process of moulding.

Can be economically moulded with metal inserts.

All pieces come from the dies in exact duplicate.

Let us have your specifications and we will tell you just how Bakelite can be utilized to meet your requirements.

Making Trucks Last Longer

Pierce Governors

The Truck Industry's Chosen Standard

A RELIABLE speed-limiting mechanism is as necessary on a motor truck as rubber tires or steel springs, if maximum durability and economy are to be realized. Excessive motor and tire wear, excessive fuel and oil consumption, high maintenance cost, and 76 per cent. of all accidents and collisions are the results of fast driving.

The best proof of the efficiency of the Pierce Governor is found in the number and standing of the truck manufacturers who use it. According to the recent compilations of specifications by trade journals, Pierce Governors are standard equipment on more truck models than the next two popular makes of governors combined. Pierce Governors limit the speed without limiting the power of the vehicle. Quickest acting governors made. Do not affect carburetor adjustments. Trouble-proof and fool-proof. Adjustments sealed to prevent tampering. Approved by the U. S. Government for use on army trucks.

Dealers who sell Pierce-equipped trucks do not have their customers continually demanding unnecessary and unprofitable service—the governor protects the trucks, makes speeding impossible and reduces upkeep cost to a minimum.

Standard Equipment on Seventy-One Prominent Makes of Motor Trucks

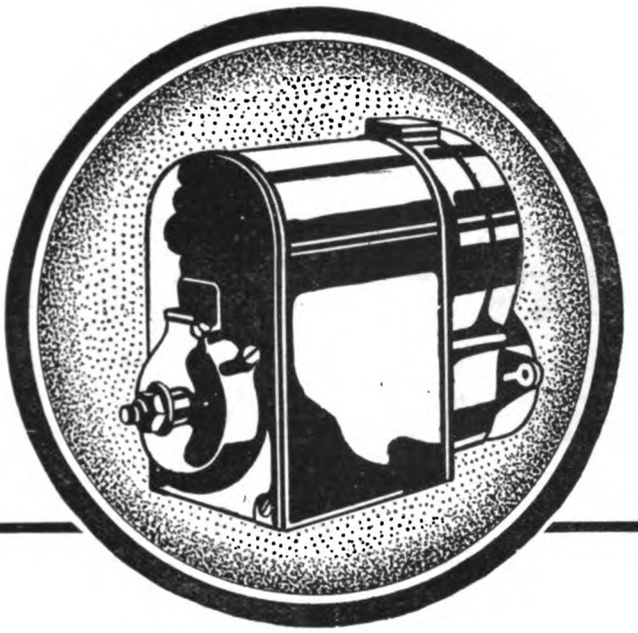
DRIDEK—

With the Leather Finish

TRADE DRIDEK MARK REG.

DrideK with its leather finish, is an entirely new creation, based on many years' experience in furnishing tops and upholstery for the majority of the cars that have been put on the market.

DrideK looks as well as the best of leather. The distinguishing features in the wear of DrideK are: that you cannot scratch the finish; that it retains its color until entirely worn out; and that it is absolutely waterproof.



The product is unquestionably superior, and the price is within reach of your specifications. Made in black and many attractive colors.

Consider the Source of Your Spark

Consider it well, for when the spark falters, so does the motor.

Consider the structural excellence of your Magneto from the electrical standpoint and from the mechanical.

Is it so designed as to yield the highest possible spark-efficiency?

Is it so designed and are the materials so selected that you need not fear its failure because of the shocks and jars of hard service?

How thoroughly is it protected from the harmful effects of dust, water and oil?

How accessible are the parts that require occasional adjusting?

The more searchingly you apply these questions to the Eisemann Magneto, the more certain you will be to agree with the leading manufacturers of trucks, tractors and pleasure cars who have adopted Eisemann as standard equipment. In all, there are 117 of them.

100% efficiency is solving one of the most vexing problems of motoring.

Pontoklene removes tar like magic! Makes tar melt and run like the proverbial snowball in a real hot place. Is also a perfect grease and oil remover—restoring the original polish of a car without rubbing. Much better than gasoline for cleaning engines.

Successfully established wherever introduced by distribution of samples. Every sample makes a buyer.

Garages supply it to their car washers because it saves hours of time and insures clean work.

The empty can makes a fine reserve oil carrier.

Prices: ¼ gallon, $1.00
½ gallon, $1.50
Quantity Discounts to the Trade

Delivered free upon receipt of price if no dealer in your city can supply you.

Special Proposition to Dealers and Distributors

Get Pontoklene in stock quick—before the road tar season starts. We will help you introduce it. After that it sells itself. Write us today.

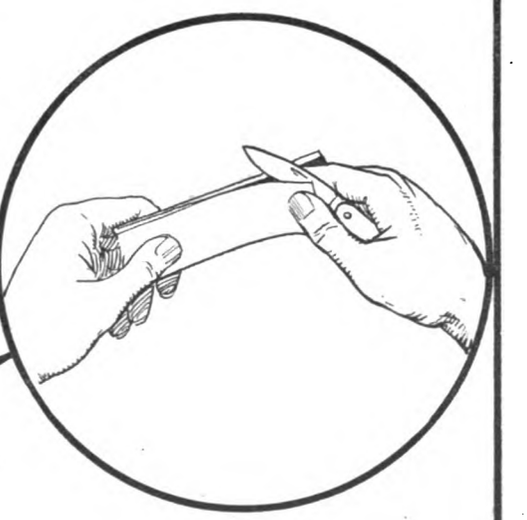
LAMINUM

The MATERIAL for SHIMS

Quick Bearing Adjustments

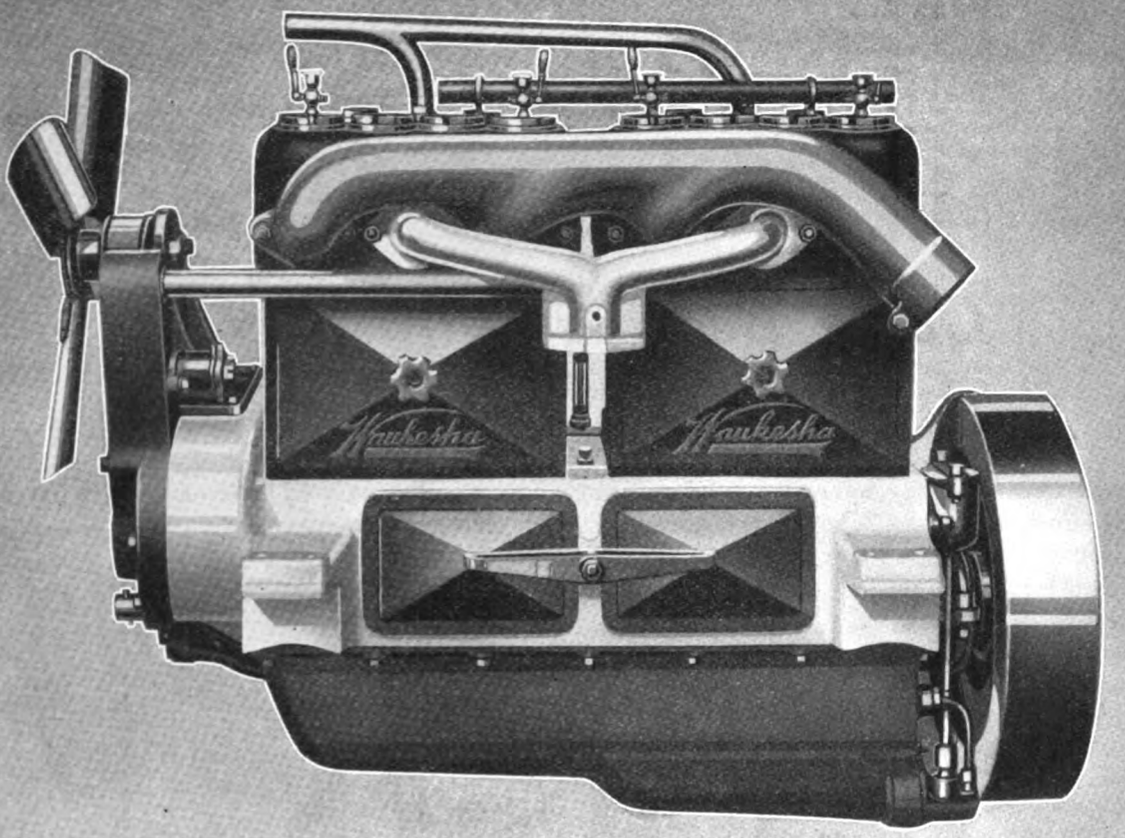
Why bother to file solid shims?
Why fuss with loose-leaf shims?
Laminated Shims save time, money, labor.



Make your shims quickly and easily with Laminum. The job is done in a moment. No trouble; no wasted effort; no lost labor and the result is absolutely perfect. You get *true* alignment and a surface smooth as glass. Here is the one great step forward in modern engineering practice. Every progressive dealer, repairman, garage owner now uses Laminum instead of old-fashioned, troublesome shims.

Take Your Penknife and Peel Off Enough Layers to the Required Thickness—That's All!

Can you imagine a greater convenience? Think how this is going to conserve time and costs. A better job and certainly larger profits. Try Laminated Shims. See for yourself how Laminum makes quick and easy adjustments. We'll be glad to send you a sample shim at our expense. Write for it—to-day.



Stock Shims for—Ford, Chevrolet Four-ninety, Continental 7-W, Continental 7-N, Maxwell, Overland, Dodge.

SPILLMAN 4

3¼ × 5 — 4 CYL

SPILLMAN ENGINES have proved their high quality, not only in Motor Cars, but in Truck and Tractor work as well.

And in the Airplane Field almost since its inception.

Spillman Motors have been accepted as leaders.

The SPILLMAN "4" has already made a truly remarkable record.

Simple in construction, accessible in every part, it has established an unusual freedom from "engine trouble" of any kind.

It possesses power, speed and flexibility far beyond other engines of its class.

Much of the refinement and characteristics that make for reliability, so essential in airplane practice, are brightly reflected in the Spillman Automobile Engines of today.

Large additional factory facilities, now being completed, have greatly increased our production capacity, and we are open for a few more contracts for early delivery.

SKF

For Quality Motor Trucks

The leading manufacturers of quality motor trucks know the importance of bearing dependability. They know that unless a truck is well bearinged it will not stand up under the severe conditions of road service. And they know, too, that SKF Ball Bearings with their self-aligning feature and double row of balls have the increased carrying capacity which commends their use for motor trucks. Because of these exclusive characteristics—their accuracy—and dependability—they are used in trucks of national repute.

The harder the service—the greater the need of SKF.

SILENCE IS GOLDEN!

Showing Morse Silent Chain Drives in Cadillac Motors

It Is Golden to the Car Builder

because his motor soon wins for itself a reputation for quietness in operation which is the one big necessary factor in the success of his enterprise. SILENCE is a modern refinement which is absolutely essential to every motor which can hope to survive in the struggle for existence. MORSE EQUIPPED motors are all among the Fittest.

It Is Golden to the Car Dealer

because modern car buyers are motor wise and know enough to use their ears in judging a car. MORSE SILENCE makes any car easier to sell. It is known to exist on over thirty of the best known of America's quality cars and gives any car possessing it a prestige which counts in landing a prospect.

It Is Golden to the Car Owner

because he need never apologize for a noisy front end. He has that satisfying knowledge that there is not a car built, whatever its price, having a more quiet, more efficient front end than his. Furthermore he has probably had experience with gears and knows that they are trouble breeders—noisy, easily stripped, and the cause of endless discontent. And he appreciates MORSE SILENCE the more.

HALLADAY BUMPERS

STANDARDIZED and SIMPLIFIED

The necessity of heavy investments by the dealer eliminated by the

Halladay Standardized Unit

By means of these four parts and a supply of bars, the dealer is enabled to assemble a bumper to fit perfectly 90% of all cars with forward frame extensions and the rear of most cars with either three-quarter elliptic springs or extended frames.

Bear in mind, these assemblies are not "make-shifts," they are as perfectly adapted to the car as are the special bumpers built for the same cars, with the advantage of a wider adjustment for height, etc. With these fittings, all Halladay bars may be used, including the new "MULTIPLE SPRING BAR."

Steel for Service

If you take two pieces of steel, both made to the same specification, they will look very much alike before any work is performed on them.

There may, however, be quite a difference, hich wil show up when work is started on the piece.

Such annoyance is bad enough in ordinary times. It is doubly bad in these times when every hour counts.

It is the aim of the Carnegie Steel Company to make its steel of such quality as to cause the least trouble while being worked and after it is put into service.

The mark of quality

every day means lives

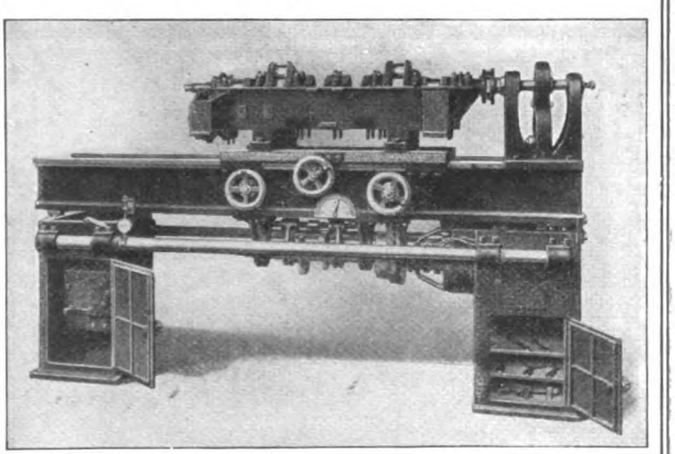
The minutes in an airplane factory today are like drops of blood.

Each day saved in balancing a crankshaft may mean an airplane at the front that much sooner.

Five minutes is all that's needed, with the

CARWEN
Dynamic Balancing Machine
(AKIMOFF PATENTS)

to tell the exact plane of unbalance and its amount.



Twenty minutes covers the entire process—static balancing in another fixture, measuring running unbalance in the Carwen machine, and drilling to correct it.

One Carwen machine will handle 100 crankshafts in an 8-hour day.

Think what it would mean if every process in making an airplane motor could be shortened as much!

Then fill the transmission case, differential and all compression cups with

NON-FLUID OIL

It'll mean a smooth-running car even in zero weather. Unlike grease NON-FLUID OIL *does not freeze.* It guards gears and bearings against friction. It lubricates *instantly* and *always.* NON-FLUID OIL lasts longer than grease and *costs less.*

Get "K00 Special" grade for gears; "K000" grade for bearings. Packed only in orange-colored cans.

Write for booklet "Lubrication of the Motor Car."

New York & New Jersey Lubricant Co., 165 Broadway New York

Hartford UNIVERSAL Joints

Established 1906

The
Hartford Automobile Parts Co.
Hartford, Conn.

We are able to offer manufacturers universal joints manufactured by specialists in one of the largest plants in the world.

The wearing surfaces of HARTFORD UNIVERSAL JOINTS are hardened and ground, the grinding being accomplished by a specially devised machine whose use eliminates depressions or elevations so common in steel parts that have been simply reamed.

The reputation of your car demands the best universal joints that can be made, and we have them.

Sexton's

CASTOR MOTOR OIL

Keeps your motor young with a perfect film of oil around *all* working parts.
Greater viscosity—perfect heat resistance—two to three times more mileage—

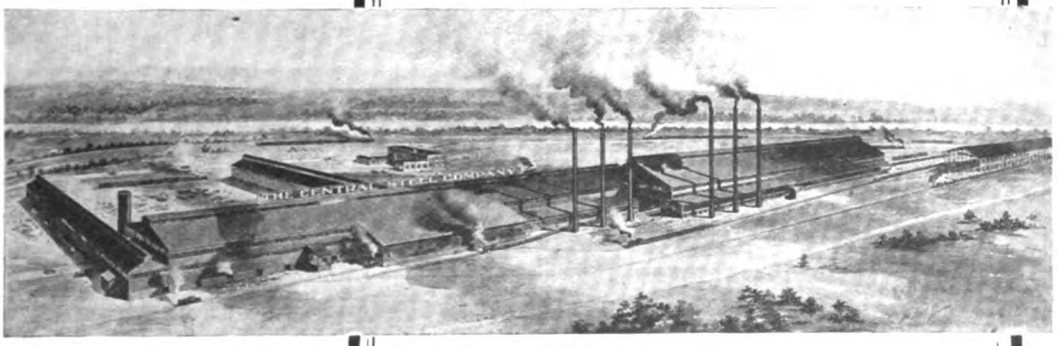
ALLOY STEELS

But three years ago AGATHON Alloys were unknown. This wonderful plant was just nearing completion.

Today AGATHON is the accepted standard for alloy steels, and this great plant, augmented by numerous additions, must work day and night to supply the demand for steels of AGATHON quality.



Intrinsic merit, nothing else, has won them this place of supreme leadership. AGATHON Alloys will serve your purpose best.

Russel Features

The power axle is entirely independent of the load-carrying axle, wholly relieving it of road and load strains.

The load-carrying axle is a one-piece round bar of heat-treated chrome nickel steel. The Russel Differential, Internal Gears and Pinion Gears are made in our own machine shops guaranteed by Russel reputation.

Russel brakes are exceptionally large and afford unusual protection to the truck on the crowded thoroughfare and steep grade.

Less complicated parts.

More efficient and reliable under all conditions of road or load.

More ground clearance.

Less dependent upon lubrication.

Operating cost less.

Assures more tire mileage.

—THAN OTHER TYPES

SLIPPERY PAVEMENTS. Horses falling. Horses helpless. Traffic retarded. It is inhuman; it is costly; it is bad business. And it is out of date.

I am the Motor Truck. I am busy, effective, resistless as usual. Slippery pavements mean no more to me than snow or mud because I am weather-proof and feeling-proof.

I am equipped with the Russel Internal Gear Drive Axle. I deliver maximum power to both wheels, close to the rims. My load I carry on a separate axle of solid steel. Therefore, I am surefooted, unfailing and uncomplaining. These things make masters of transportation.

JOHNSON'S RADIATOR CEMENT

Repairs Leaky Radiators Instantly

Stop Those Leaks

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks in just a few minutes without laying up the car. No mechanical experience is required—all you have to do is to remove the cap and pour the cement into the radiator.

JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

Quick—Efficient—Harmless

Johnson's Radiator Cement contains nothing which can clog or coat the cooling system. It will ordinarily seal leaks in from two to ten minutes. It requires no experience to use Johnson's Radiator Cement.—All you have to do is to remove the radiator cap and pour it in.

Quarts, $1.75 Pints, $1.00 Half-pints, $ .65

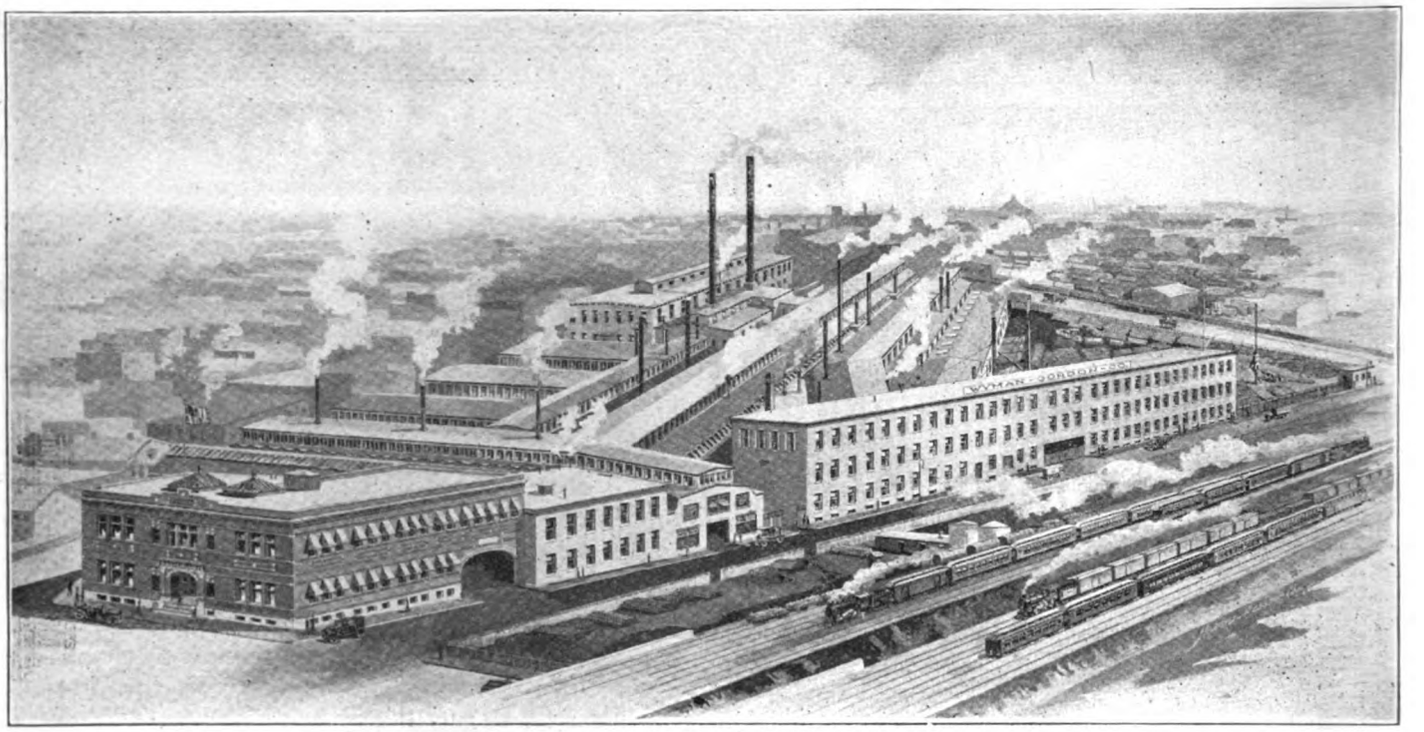
BOWER SAVES POWER

The Standard Flange Method



The same flange principle that is embodied in the construction of the flanged car wheel is also found in Bower Bearings.

It is the flange on the wheel that holds the big 200-ton locomotives on the track and guides them around curves. Also in Bower Bearings the flanged head on the rollers guides them and resists end-thrust.

"NORMA"
BALL BEARINGS
(Patented)

The difference in price between an ordinary ball bearing and the best ball bearing is never large. At most, it is but the tiniest fraction of a per cent of the total cost of a car or truck. But the difference in the service rendered may be tremendous—may mark the distinction between satisfaction and dissatisfaction.

"NORMA" Precision Bearings are the standard bearings in the high-grade magnetos and lighting generators because the makers of these accessories know from actual experience that the "NORMA" price is a premium on the safest insurance against bearing troubles.

An Indication of Quality

The Farmer is interested in the service derived from his tractor and he is learning to investigate the quality of all vital parts. The mark SKF on a bearing assures him that the tractor manufacturer is sparing no expense to give the greatest service and highest quality, for ball bearings so marked are self-aligning and accurately manufactured from steel which is hardened uniformly thruout.

Twin Cities Stage First AUTOMOTIVE SHOW

Cars, Trucks, Tractors, Accessories and Farm Equipment Assembled in Greatest Show of Its Kind Ever Held —Dealers and Distributers Grasp Automotive Idea—Attendance Breaks All Records

By David Beecroft

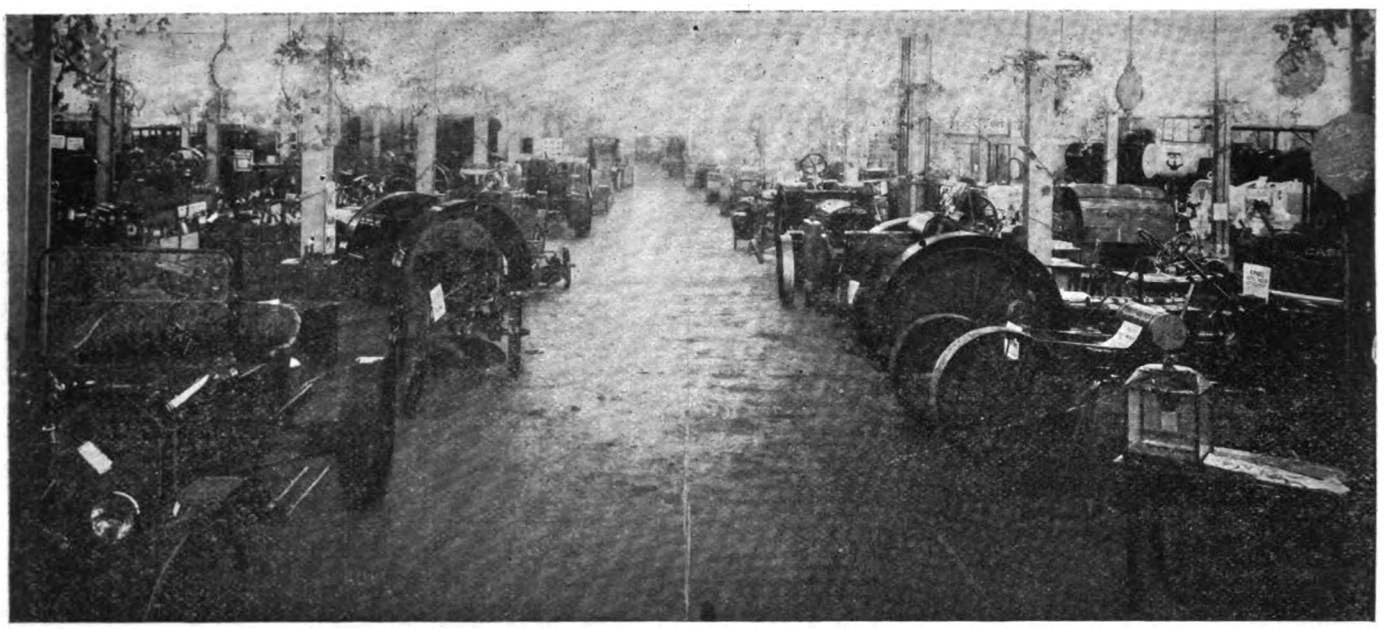
TWIN CITIES, MINN., Feb. 9—It has remained for the great Northwest, the land of the late James J. Hill, to stage the first automotive show in America, and while this first attempt is not complete it is sufficiently automotive to demonstrate unmistakably that already a new regime has taken hold of the show movement.

A five-ring automotive show is being staged here in the large Overland building, which offers 286,000 sq. ft. of floor area, which is much larger than that of either Chicago or New York. There are literally five shows in one and yet there is room to spare.

There is a show of automobiles, 46 exhibitors being present. There is a show of motor trucks with 25 exhibitors on hand. There is a show of .farm tractors with 40 firms exhibiting their different models. There is a big accessory exhibit with one hundred and fifty stands.

Lastly and perhaps not automotive, and yet on hand because of the magnetism of the automotive movement, there are more than a score of concerns participating in what is called the industrial end of the show with exhibits made up of food products, etc.

The automotive idea falls short in that there is no motorcycle representation, but this was merely an oversight. There are two airplane exhibits of model machines, etc. There is one motor boat exhibit, but there is scarcely any other city in the country better positioned for motor-boat work than Minneapolis and St. Paul, nestled as they are in one of the greatest lake areas.



Another year both of these ends of the automotive idea will surely be on hand. The house lighting idea is here stronger than at any other show and falls quite within the circle.

Not only has the automotive idea possessed our manufacturers but it is rapidly possessing the distributers and dealers of

The Twin Cities show is the first real AUTOMOTIVE show, this view showing the tractor exhibit, which was staged in a mammoth room measuring 185 *by* 200 *feet*

this northwest area a distribution zone of 400,000 sq. miles, one of the largest areas served by any group of automotive distributers in America.

Already hundreds of these dealers have for some years been selling motor trucks and more are taking on trucks each year.

For the last year quite a number have been selling farm tractors and the 40 tractor makers exhibiting frankly state that they are looking for automobile men to handle the tractors in that they are well fitted to care for the internal combustion engine as used in the tractor.

The house lighting equipment has been generally taken up by the dealer and should soon be entirely in his hands; he is the logical man for it. The same is going to apply to the motorcycle and the motor boat.

That the public has already taken hold of the automotive idea is evidenced by the attendance, which is a record breaker for a Twin Cities show. Although the show is located in the middle of the 12-mile avenue which connects the two cities, so that it requires 35 minutes to reach it in a motor cab, the attendance is far beyond that of any other year. The huge Overland storage building, the largest storage depot in the Northwest, was crowded from opening until closing each day.

The big restaurant in the basement made it convenient to spend the entire day at the show and if one got tired looking at automotive apparatus there was a movie show in the basement. For those who wished to dance there was a great dancing floor.

So completely had the Twin Cities distributers and dealers gone into the subject that they evolved the greatest transportation exhibit this country has known and unconsciously broadened the automobile sphere into the automotive, but not before the idea had already spread generally throughout the cities, towns and farms of the Northwest.

The automotive idea is one bred in the minds of the people by the natural and logical grouping of the apparatus and is not some outside idea that the show is attempting to inject into this section.

The idea was in this territory before the present show was thought of. It is the natural evolution of the explosion type engine.

Farmer Chief Buyer in Twin Cities Territory

Forty Per Cent of Cars Are Owned by Farmers, But 75,000 Still Have No Cars—Immense Market for Trucks and Tractors

ATTENDANCE figures testify best as to the hold the automotive idea has already established on the minds of the people. The total registered attendance for the seven days was 178,270, as compared with a total at the automobile show a year ago of 67,212. There were five days this year when the attendance was close to 30,000, or when the attendance each day was nearly one-half that of the entire week last year.

Such attendance figures tell a dominant story, namely: the citizens of the Northwest are not surfeited with automobiles, and in spite of war and the sacrifices of war the necessity of automotive apparatus is numerically three times what it was a year ago.

Over 5000 dealers from the territory had registered with the show management by Thursday evening, which was nearly 1000 more than for the whole week last year. The country bankers who were invited to attend by the show management had registered to the number of 2500, as compared with 2000 registrations a year ago.

There is no question but that the farm tractors and

Digitized by Google

the trucks were largely responsible for the greatly increased attendance. Still another factor must be considered, namely, that the show this year was held at a point midway between St. Paul and Minneapolis, and so drew heavily from both cities; but with all of these matters given due consideration, the attendance figures are still far above the attendance at shows last year in this zone. The necessity of motor apparatus on the farm is the big deduction from the attendance.

The analysis of automobile registrations in Minnesota during the past year shows an increasing sale of automobiles to farmers as compared with residents of cities. To-day approximately one-half of the farmers of the State of Minnesota own cars. Of the total automobile registration in the State of 184,600 cars on Jan. 1, 1918, 73,900 are owned by farmers, or 40 per cent.

Assuming that these 73,900 automobiles are distributed one to a farm, it means that almost one-half of the farmers own cars, and that, not counting replacement sales, there remain approximately 75,000 farmers who are not car owners.

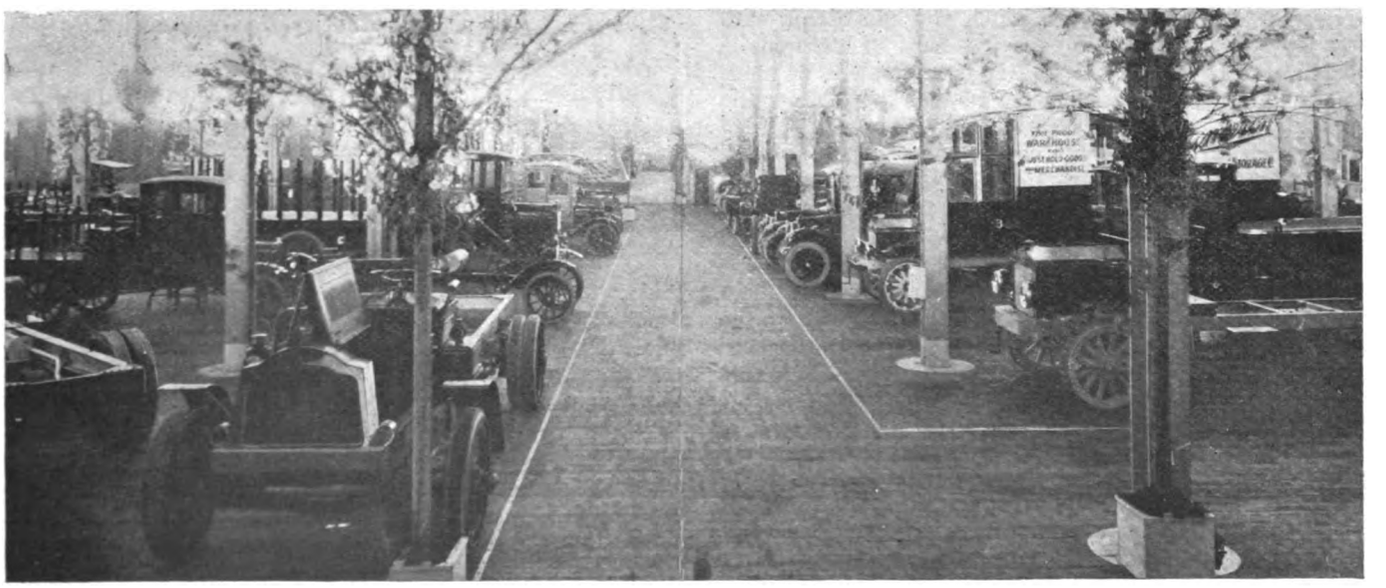
The sale of automobiles in the State during the past calendar year approximated 40,000 cars, so that the farmer demand alone should absorb this allotment for the next 2 years. But in the Northwest the cities benefit very directly, too, and, where sales to the farmer increase, sales to city residents also increase.

According to *The Farmer*, the three large cities of Minnesota, namely, Minneapolis, St. Paul and Duluth, have 750,000 of the total State population of 2,500,000. Nearly one-third of the population is located in these cities, and the registration of automobiles in them is one-quarter of the total State registration.

The majority of the cars of the State are owned in the smaller cities and towns. An analysis of the State registration to date shows 41 per cent of the automobiles registered in towns of 1000 population and under. Further analysis shows that 65 per cent of all registrations are in towns of 5000 population or under.

In the 1917 calendar year there were approximately 40,000 automobiles sold in the State, which is a bigger sale than made in any previous year, these figures indicating an increase of perhaps 15 per cent over 1916. The State had hoped for 200,000 registrations by the first of this year, but the difficulty of getting cars during the selling season of the last two years made the fulfillment of this wish an impossibility. The cars could have been sold, but they could not be obtained. The registration totals for each year since 1909, when registration was started, follow:

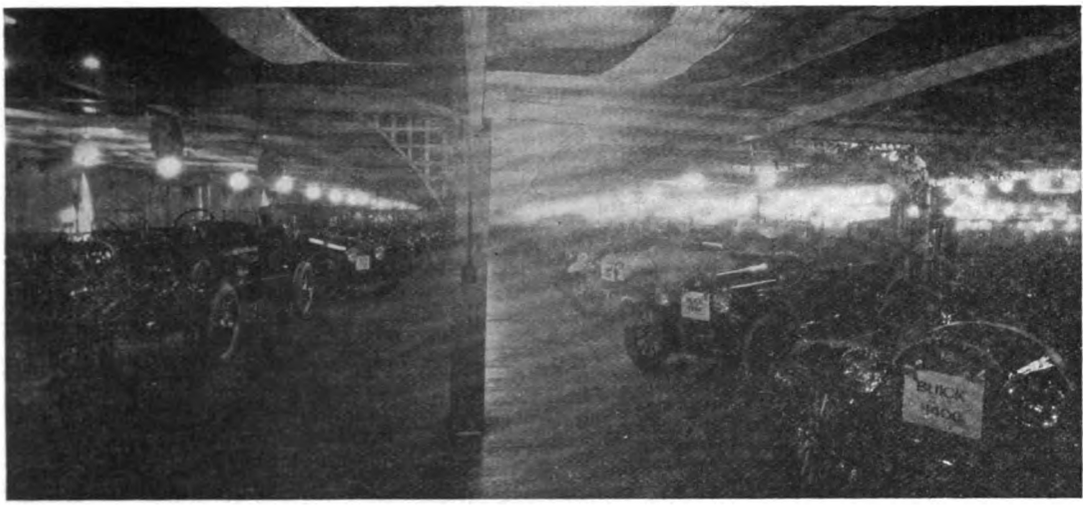
1909	7,000	1914	68,500
1910	12,500	1915	94,000
1911	19,000	1916	138,000
1912	28,400	1917	184,600
1913	45,800		



These figures indicate a steady increase each year for the past eight seasons, with three prominent seasons so far as increase in sales over preceding seasons goes. The year 1914 showed a big increase over 1913 and 1916 showed a big increase over 1915, and 1917 showed a heavy increase over 1916.

For two years the Northwest has suffered because of not being able to get enough cars, and the Pence company, Buick distributer for the States of Minnesota, North Dakota, South Dakota and Montana, started last April to get more cars than it was possible to obtain through regular shipping facilities, and incidentally exhibited one aspect of the push spirit of the Northwest.

In April the assembly of Buick cars was started in Minneapolis, and to-day Pence has a large three-story assembly factory in Minneapolis in which he has capacity for forty cars per day. Since July 1 over 2700 Buicks have been assembled, as against 450 machines shipped assembled from the factory in the same period.



The assembly building, 222 by 150 ft., is a three-story brick structure, alongside of which are two loading and two unloading railroad switches built specially for this job. The scheme of assembly is well laid out with metal tracks to guide the assembly trucks on which the chassis progress. There are overhead cranes to mount axles, engines and other parts. From this assembly floor the chassis move directly into a large steam cleaning room and then to the paint floor, where they are sprayed as in the factory. There is a drying oven that accommodates 36 chassis.

Only two models are assembled, the small six and the four cylinder, and these only in touring bodies. The bodies on the small four are enameled at the factory and are shipped ready to attach, but the bodies on the small six are painted by Pence, and he accelerates sales by furnishing color options that cannot be obtained from the

The truck exhibit at the Twin Cities show was only slightly smaller than the tractor exhibit and was placed in a room which measured 160 *by* 200 *feet*

Digitized by Google

Only one room at the Twin Cities show was devoted exclusively to passenger cars. Like the other exhibits, this was of truly heroic size, the room measuring 185 *by* 200 *feet*

factory. This color option is popular chiefly in Montana and the Dakotas, where as much brilliance in car finish is found as in any Eastern city.

Good economy in shipments is made by Pence in that the factory ships the materials in units, Pence aiming always to carry a stock of car units for two weeks' assembly. With the exception of the frames, which come direct from the frame maker, all car units come from Flint. These parts are shipped in carload lots; thus there is a carload of engines, another of axles, another of tops, another of bodies, and others of miscellaneous parts. It is possible to use 36-ft., small-door railroad cars, and in each can be carried the parts for 10 automobiles. This size of railroad car could not be used for shipping complete cars.

The economy of shipping ten automobiles in one small freight car appears when you recall that you can only ship four Buick cars, assembled, in one 40-foot railroad car.

The shipping capacity of a railroad car is increased over two and one-half times.

It is possible to ship 24 bodies in one car; forty motors can be shipped in a car; and other parts are shipped in carload lots, even to wheels mounted with tires that are inflated at Flint.

The example of the Pence company unquestionably will be generally imitated by other distributers serving large territories. It is one way in which you can obtain cars when it is not possible to get flat cars or automobile railroad cars to ship them in. It is equivalent to more than doubling railroad capacity so far as automobile shipments go. By this assembly plan Pence is able to get ahead on cars for his 450 dealers, and already is storing cars for dealers in many parts of the territory.

The distributing territory known as the Northwest must be seen to be appreciated. It embraces in the four States, Minnesota, two Dakotas and Montana, nearly 400,000 sq. miles. This represents a larger area than all of France. It is practically six times as large as the New England States, served by the Boston distributers.

James J. Hill once gave a good indication of the area served by the Twin Cities. He said that if you take the map of the United States, and, with Twin Cities as the center, draw a circle that cuts Jacksonville on the southeast, that circle on the west will not be outside of the Minneapolis-St. Paul territory.

From Minneapolis west you have a 36-hr. railroad trip, and you are still in the territory. It is no wonder then that Twin Cities automobile distributers cannot drive their cars overland even from the Twin Cities to their far-away dealers. Pence dealers drive approximately one-third of their cars from Minneapolis, but the distant ones in the Dakotas and Montana cannot.

Thinking automotively, the Twin Cities territory, while holding large possibilities for automobiles, offers the greatest market in farm tractors and motor trucks, as well as house lighting outfits and other applications of the internal-combustion engine. There were thirty-two different farm applications for the explosion engine exhibited at the show.

With 150,000 farmers in Minnesota alone, and with the average crop value per farm in 1917 of $2,868, there is no question as to the possible tractor market that remains to be developed, and it is not surprising that Minneapolis tractor builders consider the city a good center for manufacture.

The average farm size is 177 acres, which is well suited for the three-plow tractor as made to-day. In the Dakotas and Montana, average farm sizes are much greater, permitting the use of the largest type of tractor, those pulling as high as ten or twelve plows.

Crop conditions in all four of the Northwest States represent a higher money value than in any previous year; in fact, the crop valuation in the four States is nearly 60 per cent above that of 1916. The government figures place the crop valuation at $1,019,272,000, a new record. Some meaning is read into these figures when they are compared with past seasons. The 1916 crop valuation was but $649,297,000, and other crop valuations are:

Northwest Crop Valuations

1917	$1,019,272,000
1916	649,297,000
1915	618,456,000
1914	479,055,000
1913	435,082,000
1912	455,722,000

The following government figures of farm crops for 1917, and farm values in the four States of Minnesota, North Dakota, South Dakota and Montana, have special significance to all makers of automotive apparatus:

Four States	Quantity	Farm value
Wheat	183,952,000	$365,545,000
Corn	193,562,000	225,369,000
Oats	236,925,000	150,646,000
Barley	88,700,000	95,332,000
Rye	23,179,000	37,738,000
Flaxseed	7,990,000	23,798,000
Potatoes	50,085,000	49,122,000
*Hay	5,557,000	71,722,000
		$1,019,272,000

*Tons.

Standardization in Great Britain

STANDARDIZATION was the main topic at the recent fourth meeting of the Technical Committee of the Motor Industries in London. Recommendations were submitted for the consideratiton of the Engineering Standards Committee in regard to bolt type detachable wheels for pneumatic tires, tire sizes, loads and inflation pressures, road springs and chassis dimensions for carriage work. Three sub-committees were appointed to consider and report upon: (1) Fuel for internal-combustion engines; (2) the formation of an education committee; (3) the proposed laboratory for internal-combustion engine research. These are solely internal committees, and are not put forward in any way with a view to overlapping the work which is being carried out by other committees in the same direction. The standardization of automobile parts has now been under consideration by the Engineering Standards Committee for some considerable time, and the result of the work of the numerous sub-committees is beginning to bear fruit. The following reports have already been issued by that body, and may be obtained from the Engineering Standards Committee, 28 Victoria Street, S. W. 1: No. 71, Report on British Standard Dimensions of Wheel Rims and Tire Bands for Solid Rubber Tires; No. 80, Report on British Standard Dimensions of Magnetos; No. 45, Report on Dimensions for Spark Plugs.

Fundamentals of Tractor Design*

Size of Tractor, Horsepower and Drawbar Pull—Existing Tractors Analyzed as to Weight and Piston Displacement—Probable Future Development—A Liberty Tractor Design Suggested

By George T. Strite

THE first question to be settled in the design of a tractor is that relating to the size of the machine, the number of plows it will pull or the drawbar pull it will develop. This has been a very hard question to settle. For many years the tendency has been to keep increasing or trying to do just a little more, no matter what size you started with. Even in the days of the big tractor, of 8 and 10 plows capacity, the pressure exerted by customers calling for just a little more power was hard to resist, and the temptation was continually before us to build something larger, although even then most of us knew that the time would come when the small tractor would have its day.

Since the complete readjustment of the tractor manufacturing business, when most companies started with the two and three-plow machine, there has been a constant demand for just a little more pulling capacity. One of the hardest things in the tractor business is to have the nerve to stand pat and build one size and not keep constantly increasing the size so that it will do a little more work.

Power and Traction Required

The next step after the size has been determined is to deal with two related factors, the amount of power and the traction. Here again is a hard question to decide: Whether or not to provide sufficient power so that the motor will not stall but will turn the wheels regardless of the kind of ground or footing you have. If you put in 5 or 10 hp. more than required for ordinary work, then the entire transmission and tractor must have sufficient strength to take care of the additional load and turn the wheels under extreme conditions. Would we think of buying an automobile to-day with power enough (and transmission enough) so that we could spin the wheels on high gear and dry ground? This would be absurd.

However, from a sales point of view, there is one reason why we have done this in tractors. In demonstrating the tractor it is generally loaded to the limit, and if we kill the motor it is a hard knock against that tractor, while if there is sufficient power to keep on turning the wheels, even to the extent of burying the tractor in the ground, this brings out applause and the farmers will say: "Gee, but that tractor has got the power."

Personally, I am inclined to think that we have carried this to extremes. What the average wheel tractor needs is more traction in proportion to the amount of power. The farmer would then get a more efficient machine, and a better balanced one, a machine that could be used under extreme conditions, on wet soft ground or sandy ground. I am inclined to think that as soon as the farmer is educated on this point we will all begin to build tractors better balanced for average efficiency, and not build tractors that will do certain stunts, regardless of the average work the tractor will be expected to do. In other words, both the farmer and manufacturer will use more horse sense and keep an eye on average efficiency.

Weight and Ground Surface

When we have settled between power and traction the third item to consider is ground contact surface and weight of the tractor. In the old days we built tractors which were exceedingly long in weight and rather shy in supporting surface. The tractor of to-day is being built with less weight, this having been made possible by the use of multiple cylinder motors, high grade materials and more surface on the ground. The surface must also be backed up by the proper shape and style of grounders or lugs.

After the total weight of the tractor is determined, there arises the question of the proper distribution of this weight. If it is a four wheel machine with two drivers in the rear and two front wheels, then careful judgment must be used as to how much weight to place on the drive wheels and how much on the front wheels. The best practice to-day seems to be about 70 per cent of the total weight on the rear drive wheels and 30 per cent on the front wheels when the tractor is not exerting any drawbar pull. This means that when the tractor is pulling a reasonably heavy load, there will be 85 per cent to 90 per cent of the total weight of the tractor, plus a certain percentage of the drawbar pull, on the rear wheels. This last mentioned item depends upon the height of the drawbar hitch on the tractor, the height of the hitch on the plow and the load being pulled. This leaves from 10 per cent to 15 per cent on the front wheels, which for all practical purposes is enough to steer the tractor. However, in going up a steep grade the front wheels are apt to rise and make it hard to steer the tractor.

The motor horsepower for the tractor depends first upon the drawbar pull, which, however, does not mean anything unless the speed is taken into consideration. It takes practically the same power to pull two plows at 3 m.p.h. as it does to pull three plows 2 m.p.h. This is a point in regard to which the farmer has been greatly deceived. Some companies have sold their tractors on drawbar pull in pounds, saying nothing about the miles per hour, while other companies made a strong point of the miles per hour. Both factors together determine the drawbar horsepower.

Power Based on Total Displacement

In connection with the speed and drawbar pull the type of motor and the weight of the tractor must be taken into consideration. From an engineering standpoint—and I think, eventually for the convenience of the farmer—the power should be rated in the specification books on the basis of total displacement. In the following figures I am not going to take into consideration the speed of the different tractors in miles per hour. There is very little difference in the speed of the three machines in group A. In group B there is also surprisingly little difference in speed, in practical farm work, although there is a difference between groups A, B and C, as the small tractors will average from 10 per cent to 15 per cent higher in speed. However, for the sake of comparison, we will disregard the miles per hour in the table.

Out of ninety-five different models in the tractor specifications books, I have taken ten tractors which are among the most noted. The makers of all of them have 500 or more tractors actually in the field. The first three in group A are the large type, two two cylinder and one four cylinder. The next group, B, are the four cylinder 3 and 4 plow tractors of late models and light weight. In group C we have three of the two-cylinder 3 and 4 plow tractors of recent design, but possibly not the latest design. For comparison I wish to take up—

First, the cubic inches of piston displacement per minute for each 14-in. plow pull.

Second, the cubic inches of piston displacement for each 100 lb. rated drawbar pull.

Third, the cubic inches of displacement for each rated drawbar horsepower.

*Read at the S. A. E. tractor meeting held at Chicago on Feb. 1.

Fourth, weight of tractor for each 14-in. plow pulled.

Fifth, weight of tractor for each 100 lb. drawbar pull.

Sixth, weight of tractor for each rated drawbar horsepower.

You will note in column nine, tractor No. A-1 has a piston displacement of 147,250 cu. in. per minute for each 14-in. plow pulled.

Tractor No. A-2 has a piston displacement of 86,206 cu. in. per minute for each plow pulled.

Tractor No. A-3 has a piston displacement of 88,312 cu. in. per minute for each plow pulled.

In column nine, the average piston displacement per minute per plow, of the three tractors in group A is 107,256.

The average piston displacement per minute per plow of the four tractors in group B is 91,450, or 15,000 cu. in. less than group A.

The average piston displacement per minute per plow of the three tractors in group C is 85,771, or 21,000 cu. in. less than group A. You will notice that the two-cylinder tractors in group C have less displacement per minute than group B, the four-cylinder machines of the same size, or less power per plow.

In column ten we have in group A the average piston displacement per minute per 100 lb. pull on the drawbar, 14,581 cu. in.

In group B the average piston displacement per minute per 100 lb. rated drawbar pull is 11,247 cu. in., or about 3300 cu. in. less than in group A.

In group C the average piston displacement per minute per 100 lb. rated drawbar pull is 12,164 cu. in. You will notice that in this case there are 900 cu. in. displacement more than in group B and 2400 cu. in. less than in group A per 100 lb. rated drawbar pull.

In column eleven we have in group A the average piston displacement per minute for each rated drawbar horsepower, 25,846 cu. in.

In group B, the average piston displacement per minute for each rated drawbar horsepower is 23,544 cu. in.

We have in group C for the average piston displacement per minute for each rated drawbar horsepower, 22,728 cu. in. You will notice that group B, the four-cylinder machines, have 700 cu. in. more displacement than group C.

In column thirteen we begin the relative weights of the three different groups of tractors. You will notice the average weight of the three large tractors in group A is 21,866 lb. The average weight of the four-cylinder tractors in group B is 5160 lb. and the average weight of group C, the two-cylinder tractors, is 5800 lb. or 650 lb. more per tractor than the four-cylinder machines, while the average drawbar pull of group B tractors is 429 lb. more than that of the group C two-cylinder machines.

In column fourteen we have the weight for each 14-in. plow pulled. You will notice the average weight of the large tractor in group A is 2733 lb. for each 14-in. plow pulled.

The average weight of the tractors in group B, which are four-cylinder, three and four plow machines, is 1593 lb., or nearly 250 lb. less for each 14-in. plow pulled than the weight of group A machines.

The average weight of the group C two-cylinder tractors is 1815 lb. for each 14-in. plow pulled, or nearly 250 lb. more than the average four-cylinder machine and about 1100 lb. per plow less than group A.

In column fifteen we come to the weight of tractor for each rated drawbar horsepower. In the large tractor we find this to be 681 lb. In group B, the four-cylinder tractors, we find an average weight of 374 lb. for each rated drawbar horsepower. In group C we find a tractor weight in the two-cylinder tractor of 482 lb. for each drawbar horsepower, or 108 lb. more than in group B and 200 lb. less than in group A.

In column sixteen we have the weight for each 100 lb. of rated drawbar pull. In group A you will notice this to be 374 lb. In the group B four-cylinder tractors the average is 199 lb. or 75 lb. less than in group A, and in group C it is 258 lb. more than in group B and 117 lb. less than in group A.

It is interesting to note in this connection that the highest piston speed in feet per minute is in group A and the highest crankshaft speeds are in groups B and C.

Both Types Show Development

Both the four-cylinder and two-cylinder late type tractors show a wonderful development, especially so in regard to the weight per plow and per horsepower. There is every reason why the large tractor should weigh less for each plow and for each 100 lb. of drawbar pull than the small tractor. This is due to the initial weight of the tractor, which in a one or two plow tractor is very high. The more plows we have to distribute the initial weight over, the less the weight for each plow.

For instance, it takes an initial weight of 1500 to 2000 lb. to pull one 14-in. plow; 500 to 1000 lb. more to pull two plows and 300 to 700 lb. more to pull the third plow. The displacement is affected in the same way, as it takes a certain displacement for the machine itself.

You will note that there is some variation in these averages. I think these are caused by some tractors being overrated in drawbar horsepower and drawbar pull, while others are very conservatively rated. As a rule, the four-cylinder machine shows a higher state of development than the two-cylinder machine. You will notice that in one case the rated drawbar pull is almost equal to the entire weight.

There is a question as to how far we can go in reducing the

Digitized by Google

weight per 100 lb. for practical everyday use under average conditions of soil. I can see how we can eventually build tractors so that they will pull more than their weight, providing the speed is not too high, and that they are, as it were, geared to the ground, or used in certain sections where this is possible, I do not think it is possible under average conditions. However, our friend W. N. Smith will probably tell us later on that this can be done by the use of the "Never Slip" or "Caterpillar type." I admit that there is a big field in certain sections and for certain uses for the machine that Mr. Smith will tell us about, but the wheeled machine is going to be the popular machine and the big seller for average agricultural purposes.

Tractor engineers have been severely criticized in some cases for the past and present state of the tractor, with its various different designs. However, it is only through the development of different types and different designs that the law of the survival of the fittest can assert itself.

From now on the tractor industry is going to advance either by the survival of the fittest and the natural evolution of the right tractors succeeding and the wrong gradually dying out or getting in the right track, or, the tractor engineers and manufacturers getting together and through standardization avoid a lot of wrecks and failures which must come some time.

The tractor manufacturers of to-day have the greatest opportunity that any manufacturing industry has ever had in the history of the world. They have an opportunity of carrying standardization farther, if they will get together, work together, and, through the Society of Automotive Engineers, assist in putting through the standards which are necessary, and not try to hold back.

It has been said that eastern automobile manufacturers are going to try to get into the tractor manufacturing business. They are going to get in, and personally I believe that the sooner they get in the better, although they will probably spend fortunes to learn just what many of us have learned, but the automobile manufacturer has four advantages over the tractor manufacturer:

1—He has the money and is looked up to by the investor as a successful business man.

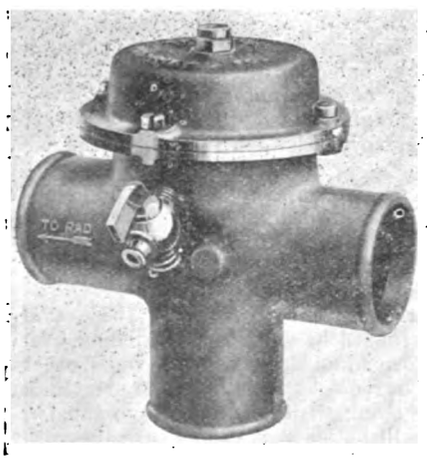
2—He knows how to get production, and he has the organization and equipment to get production.

3—By past experience in the automobile industry he knows the value of standardization, and will help standardize the parts of tractors.

4—He has learned to cut out petty jealousies and petty ideas, and to look at average results. One of the greatest troubles in the tractor business to-day is the prevalence of jealousy, of the craze to "beat" the other fellow, and of petty ideas. Some tractor men stick to these ideas until their company is bankrupt.

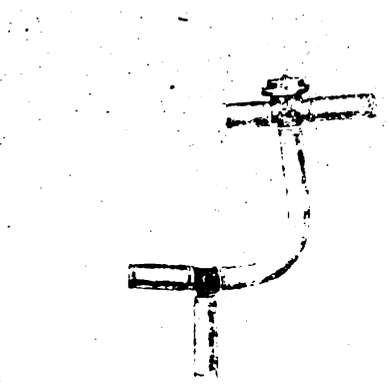
The tractor business is an important business. It is going to be one of the greatest in volume of all businesses. The tractor has a greater bearing on the food problem and the general happiness and welfare of mankind than any other machine ever brought out. It is going to entirely revolutionize farming in all parts of the world. It will lead to the adoption of better methods of tillage which are going to mean more food for the world at far less cost.

Considering the state of the tractor industry at this time, the inability of the companies to produce tractors fast enough and the quality of tractors that are being turned out, I believe that a Liberty tractor should be designed to be manufactured by the Government during the war. Any company should be free to manufacture this tractor as a whole or to use any feature thereof it might see fit, after the war. The corps of engineers appointed to design and build this machine should be given instructions not to do any experimenting, but to work on the lines of the best we have in the tractor as it is to-day.



This move would do more to bring about standardization and development of the tractor than any other move that could possibly be made. It would result in the greatest good to all and especially to the tractor manufacturer. The war has emphasized the need and advantages of standardization in other machines. Why should not the same apply to the tractor?

Standardization has been greatly misunderstood. It does not mean that the different tractors will lose their individual characteristics; it does not mean a standard tractor. It does mean standard dimensions for certain parts and cutting out odd sizes, which will cut out unnecessary time and expense in the engineering department. It will reduce cost of parts by reducing multiplicity of parts. It will mean quicker and better service to users. Standard dimensions as, for instance, a drawbar height of 17 in. and a standard speed of 2 1/3 m.p.h., will do away with confusion, misunderstanding and unnecessary expense.



Standard units or parts mean that parts of different makes will fit in the same place, with the same bolt, interchangeably. It means that any magneto, carbureter or clutch can be used on the same motor of the same size. It means that a Waukesha, Buda or Erd motor of the same size can be used without change. It will eventually mean that a Foote, Nuttall or any other standard transmission will fit the tractor without change, of even a bolt hole. Many different tractors have the Waukesha motor. Do they look alike? Doesn't each have its own individuality?

Rayfield Thermostat Control Involves New Principle

HERETOFORE thermostatic valves in cooling circuits simply obturated the circuit at one point when the temperature of the water dropped below a certain point, thus preventing all circulation through both the engine jackets and the radiator. There is a clearly defined object in shutting off circulation through the jackets—namely, to maintain the cylinder walls at a relatively high temperature. This object is not furthered, however, by preventing circulation through the radiator, as with the jackets shut off from the radiator no heat can be transferred from the former to the latter.

Rayfield thermostat

Method of installation

Charles Rayfield, engineer of the Findeisen & Kropf Mfg. Co., Chicago, has developed a circulation control system embodying two butterfly valves linked together, in connection with an expansion coil which opens the upper valve and closes the lower one when the circulating water reaches a temperature of 170 deg. Fahr., thus permitting circulation through the radiator, whereas if the engine is cold the upper valve is closed and the lower one open, water circulating through the radiator and pump only. Thus the water in the cylinder block is gradually displaced until all of the water in the system is raised to the predetermined temperature, which in this case is 170 deg. Fahr.

Fiat Tractor for Hauling Field Guns

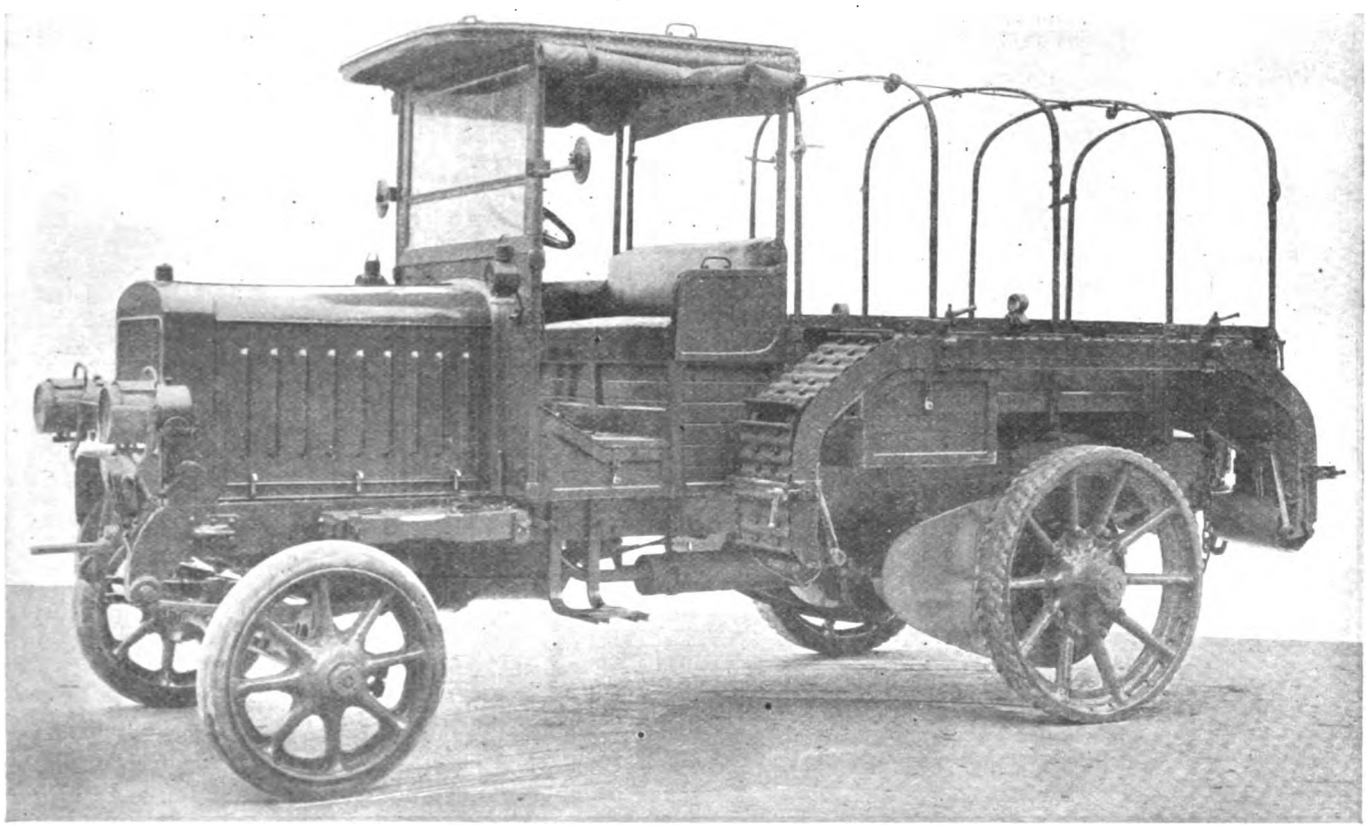
Weighs Eight Tons and Is Capable of Hauling 25 Tons Up a 15 Per Cent Grade—Chain Drive to Rear Wheels

A VEHICLE designed to haul guns naturally must differ considerably in design from a touring car or truck. Not only must it be capable of hauling heavy loads, but it must possess the ability to travel over any kind of country and get itself and its trailers out of every kind of difficulty. The three main types of artillery tractors are four-wheel drivers—in which power is delivered to the front as well as to the rear wheels; the caterpillar or track laying tractor; and the rear wheel driver with special driving wheels.

The most extensively employed of the latter is the Fiat 70 hp. tractor, used throughout the Italian artillery service, and also by the French. This tractor, which weighs nearly 8 tons empty and carries a load of 3½ tons on its platform, is capable of hauling 100 tons on good level roads and can climb gradients of 15 per cent with 25 tons in tow. Its road speed varies from 1 to 8 m.p.h. It is claimed to be able to handle the largest guns used in the field, and to have taken big guns into mountain positions altogether inaccessible to horse teams.

Chain Drive Inclosed

On the Fiat tractor the power is transmitted to the rear wheels through inclosed side chains, the housings of which not only act as radius rods but are sufficiently heavy to carry the weight of the vehicle if the wheels embed. Front wheels are cast steel shod with rubber tires, while at the rear there are big diameter steel wheels of a patented type designed to receive around their circumference an endless steel band. When not in use on the wheel these bands are carried on platforms which form mud-guards alongside the body. Being heavy, they are hauled into this position or lowered to the ground by means of a hand winch. These bands, which are only put on when roads are in very bad condition, or when the tractor has to operate away from made roads, increase the supporting surface and also increase the adherence.

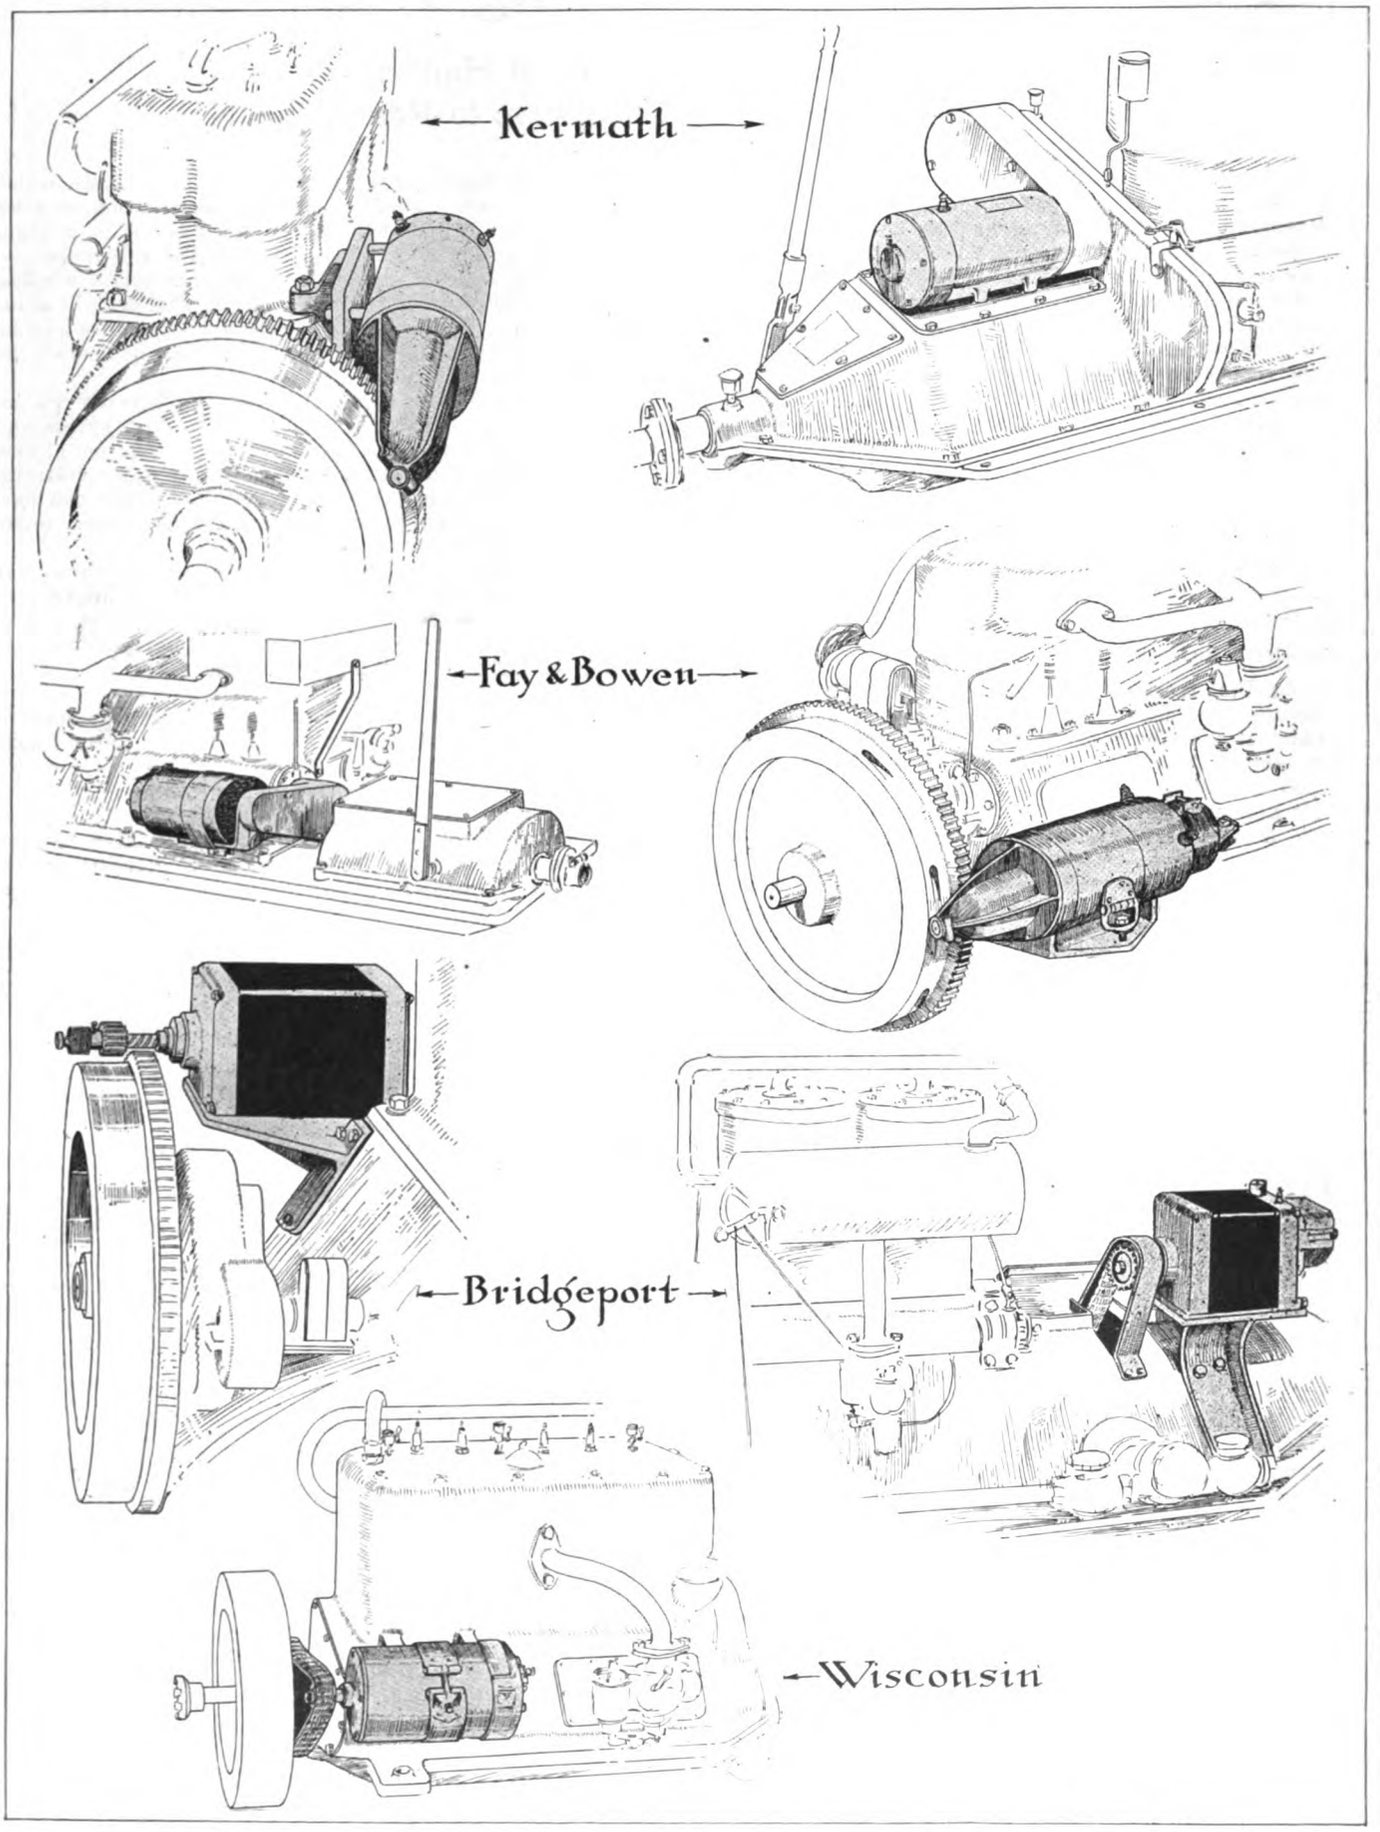


The tractor is fitted at the rear with a powerful winding drum having 60 yd. of 15 mm. steel cable. This drum is made use of when the tractor cannot get its trailers or its gun up a hill by direct haulage. Then it climbs alone, unwinds its cable and hauls its load up slowly.

The engine has four cylinders of 5⅛ in. bore by 8⅛ in. stroke, with a normal speed of 1000 r.p.m. Four speeds and reverse are afforded by the transmission. A differential lock and very powerful water-cooled brakes are other features. There is a special device whereby the hand brake can lock either wheel, as desired, thereby facilitating getting round corners on steep mountain roads.

The Fiat tractor is at present employed exclusively in war service. The results obtained in the haulage of artillery in the Alps have induced the makers to believe that it will be used extensively after the war in peaceful occupations, particularly in the colonies and new countries.

—



A SURVEY of aircraft traffic plans in Sweden was made at a recent meeting of the Aeronautical Society in Stockholm by Capt. Dahlbeck, the meeting being attended by the crown prince, the premier and members of the cabinet. Denmark has no air traffic society yet, but a large new factory for airplanes is in full swing. Denmark is interested in comprehensive international schemes, such as England-Denmark-Sweden and Germany-Sweden-Norway, that is as an intermediate link.

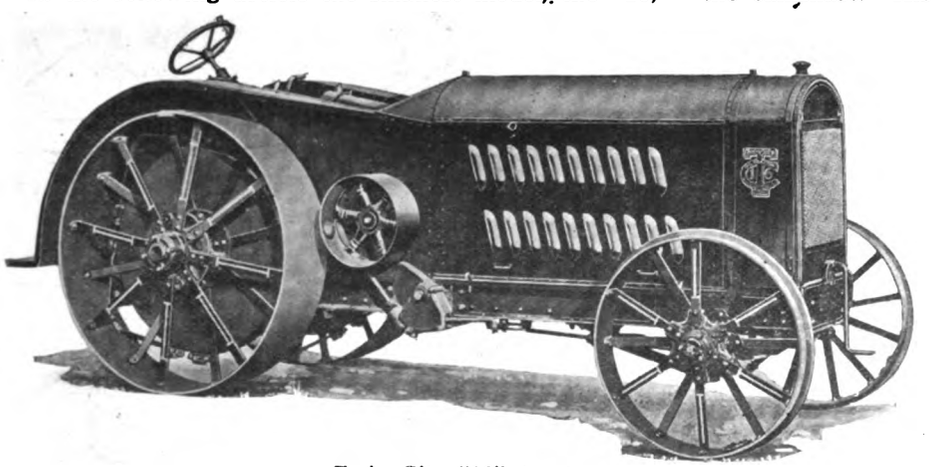
The Twin City "16" Oil Tractor



Built on Automobile Lines—Total Enclosure of All Working Parts, Extensive Use of Anti-Friction Bearings, Spring Suspension in Front and Rear, and Smooth Exterior Lines Its Chief Characteristics

By P. M. Heldt

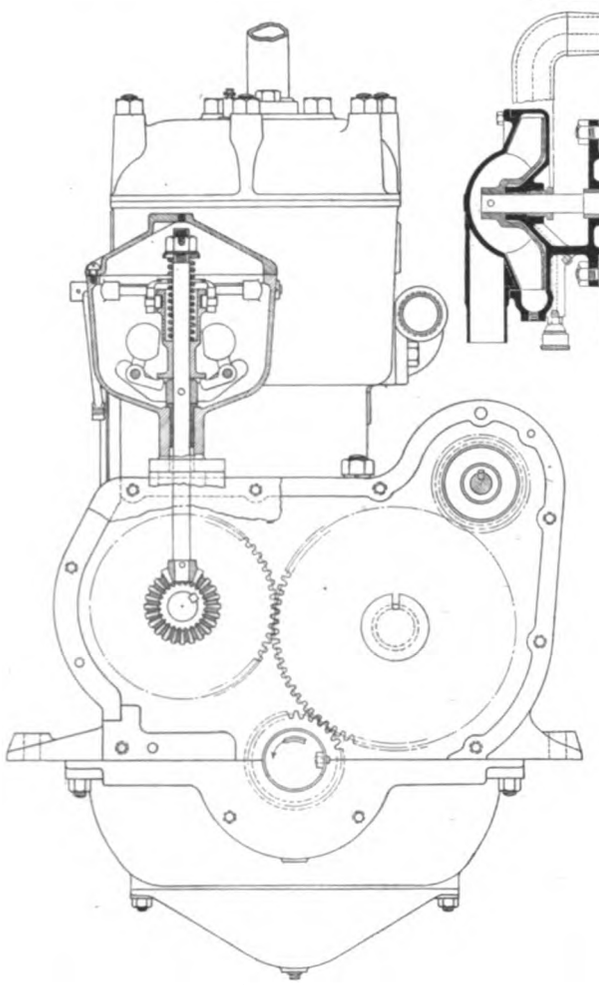
MINNEAPOLIS has long been a center of the farm tractor industry, and among the leading concerns in the business in the Flour City is the Minneapolis Steel & Machinery Co., which turns out the Twin City line of tractors, comprising four different models. The line ranges from the moderate sized "16-30" to the huge "60-90" and covers every requirement of farm work. Three of the four models are fitted with four-cylinder engines, while the largest has a six cylinder one. The cylinder dimensions and piston displacements are as follows:

16-30	25-45	40-65	60-90
5 x 7½ in.	6¼ x 8 in.	7¼ x 9 in.	7¼ x 9 in.
589 cu. in.	982 cu. in.	1486 cu. in.	2229 cu. in.

In the following article the smallest model, the "16," is specially dealt with. The latter is equipped with an engine of thoroughly modern design. Its four cylinders are cast in a block and the cylinder heads are detachable. The jacket space tapers slightly from the top to the bottom, so that the greatest amount of water is carried where the greatest cooling effect is needed. It will be noticed from the sectional view herewith that the water space is especially liberal around the head. The spark plug is so located as to insure effective cooling—a point of considerable importance where kerosene is the fuel used. A somewhat unusual feature is the high bosses for the cylinder head retaining bolts. Their object is apparent, however, for it will be seen that the faces of these bosses are in a plane with the faces of a number of other bosses on the head, so that all can be milled off in one operation. In order to obviate condensation of the fuel in the intake manifold, the latter is cast integral with the cylinder block, and there is only a single joint between the inlet pipe and the engine. The exhaust manifold is outside the cylinder casting and is of special design.

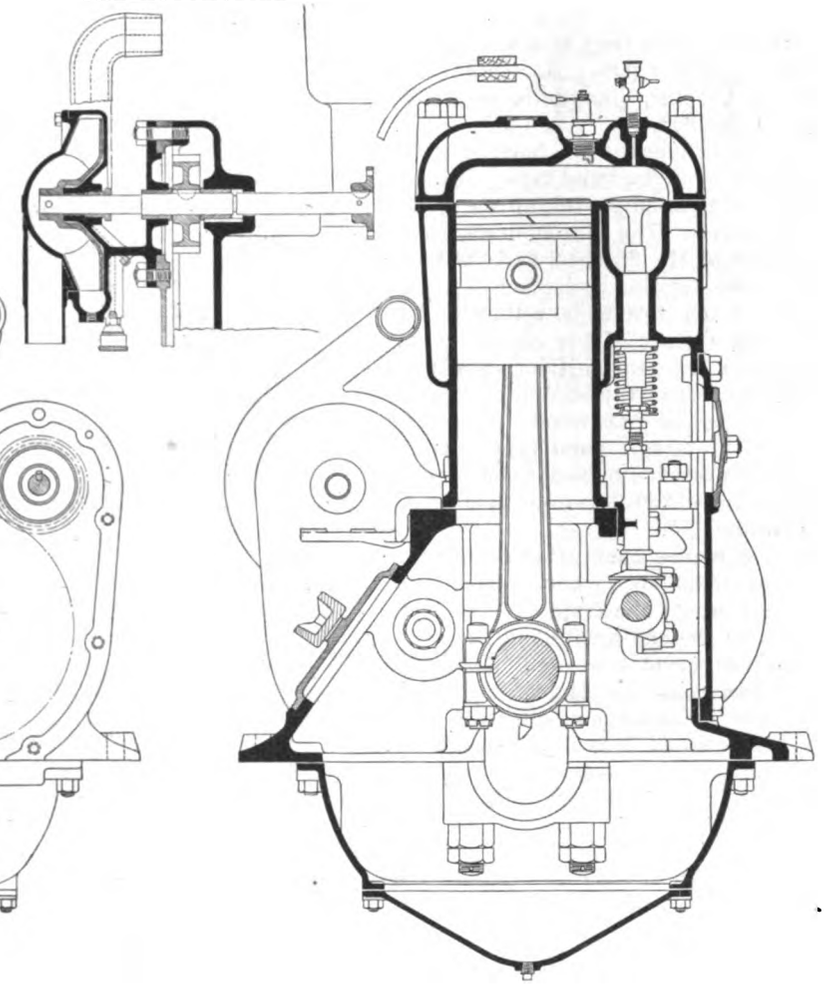
Twin City "16" tractor

The pistons are comparatively long and are provided with three compression rings at the upper end. Over the piston pin, the piston is deeply relieved, making it of what has come to be known as the hour-glass type. Adjacent to the piston pin ends the relief extends considerably farther up and down the pistons. A hollow, hardened piston pin is used. It has its bearing in the connecting-rod, being secured in the piston bosses by means of a key and set screw. The connecting-rods are drop forgings of the usual I section.



The small pinion on the crankshaft meshes with a large idler gear and the latter in turn meshes with the gear on the camshaft. Also meshing with the idler gear is a small gear for driving the water pump and the magneto shaft, both of which latter devices run at crankshaft speed. The crankshaft pinion is of forged steel. In fact, all of the gears of the camshaft drive are of steel and the idler gear is hardened. From the forward end of the camshaft the governor is driven through bevel pinions. The governor is mounted on a vertical shaft and acts on a forked lever the spindle of which extends through the wall of the governor housing. A lever arm secured to the spindle outside the housing connects to a butterfly valve in the inlet pipe. There is another, hand-controlled butterfly valve in the carbureter. By removing a plate at the forward end of the engine all of the gears of the camshaft and accessories drive are rendered accessible.

Valves of the usual 45 deg. poppet type are used and are located all on the same side of the cylinder block, which is of the L-head type. There are no caps over the valves, and in order to get at them it is necessary to remove the cylinder head. Valve caps or plugs often are a source of trouble, because of their overheating and causing preignition, and, besides, it is figured that when one valve needs attention it is generally good policy to look them all over and the cylinder head can be taken off as easily as eight valve plugs can be removed.



The push rods or cam followers, which have flat bottom ends, are mounted in guides bolted against the upper part of the crankcase, four guides being in one piece.

The entire side wall of the engine from the lower edge of the valve pockets to near the central flange on the

Digitized by Google

Front view of engine, showing gearing and governor

Section through engine, indicating accessibility of parts

crankcase is removable, but there are hand holes in this large side plate directly opposite the valve adjusting nuts, and the hand hole covers can be removed in case an adjustment is to be made. On the opposite side of the crankcase there are two large hand holes with cover plates through which the connecting-rod bearings may be adjusted and piston and connecting rods removed if desired. For the adjustment of the camshaft bearings it is necessary to remove the large side plates. The camshaft has its bearings between the side of the crankcase and bearing caps. It can be easily removed. All of the three crankshaft main bearings are supported by the upper part of the crankcase, thus making it possible to remove the lower half of the case without disturbing any other part.

A Kingston 1¾ in. carbureter is used, in connection with a special vaporizing manifold. The exhaust manifold is of what may be described as the looped type. A part of the lower branch of the loop is surrounded by the vaporizer. At each end of the upper branch of the exhaust manifold there is a butterfly valve by which means it is possible to let any part or all of the exhaust gases pass through the lower branch, thus increasing or decreasing the heating effects in the vaporizer at will. The vaporizer is in the form of a jacket over the exhaust pipe within which jacket there is a series of baffles compelling the gases to take a zigzag course.

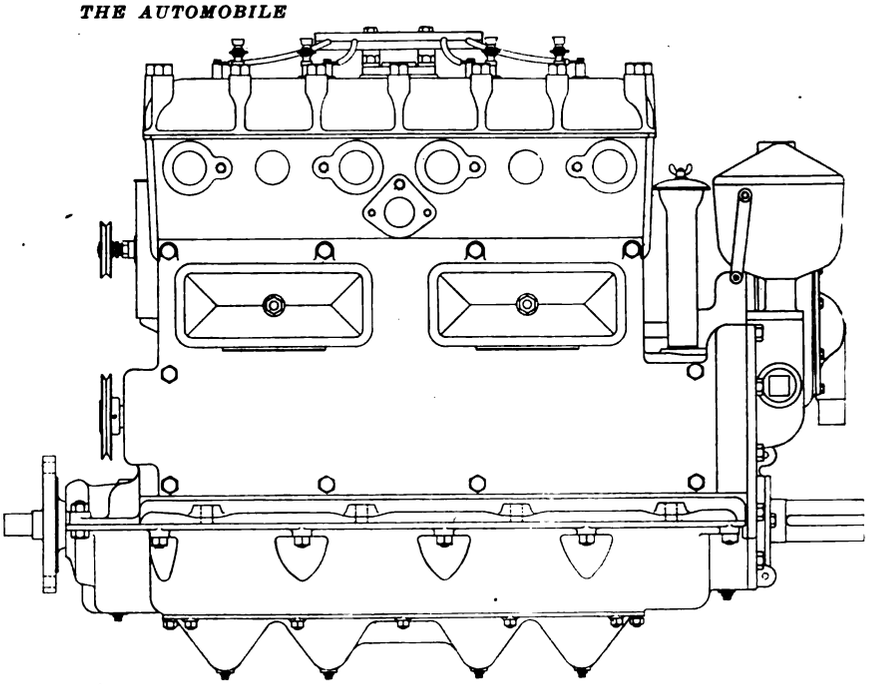
Under ordinary conditions, the Twin City "16" operates on kerosene, its carbureter being fed from a 33 gal. tank. The engine is started on gasoline, however, and a storage capacity of 3 gal. of gasoline is provided. By means of a three-way valve located close to the seat of the driver, the change from one fuel to the other can be made. The kerosene tank is located under the rear platform or floor and is of sufficient capacity for a day's work. The gasoline tank is cylindrical and is located on the left hand rear wheel guard. From the kerosene tank the fuel is fed to the carbureter by the Stewart vacuum system.

Ignition is effected by a K-W magneto with impulse starter. Timing of the spark is controlled by hand. Lubrication is by means of a Detroit lubricator which is mounted on a bracket at the side of the cylinder block. From this lubricator oil leads run to each of the three main bearings and to each cylinder. The lower part of the crankcase is made in the form of a set of troughs under the connecting-rod heads, and splash lubrication is used in addition to the force feed. Each connecting-rod cap is provided with an oil spoon which dips into the oil in the troughs. The lubricator is driven through a round leather belt from the rear end of the camshaft.

Liberal Cooling System

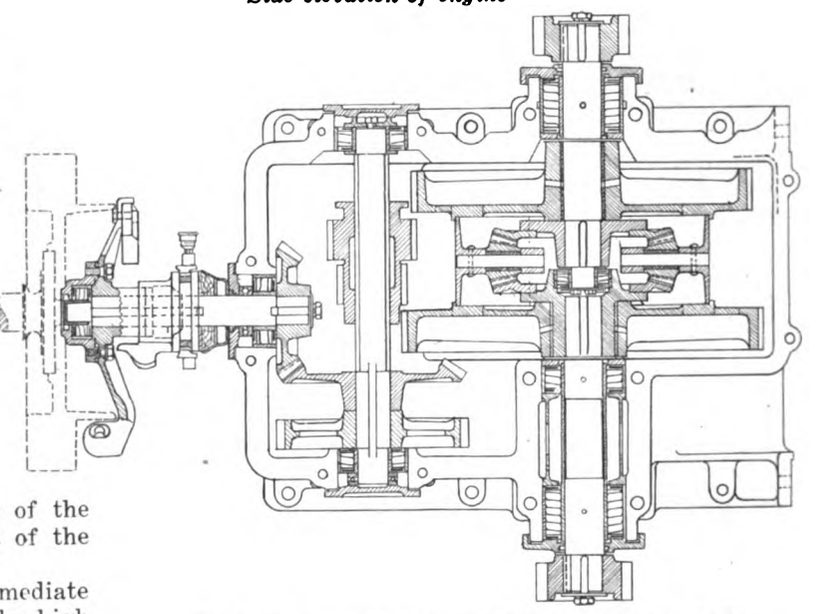
A centrifugal water pump of liberal size is mounted as a unit at the front end of the cam gear case. A horizontal, tubular type of radiator is used, the tubes being of small diameter and placed close together. There is no less than 154 sq. ft. of cooling surface in the radiator and the cooling system has a capacity of 35 gal. A four-bladed fan 24 in. in diameter is mounted on the front cover and is driven by a 2½-in. flat leather belt off the crankshaft at 1900 r.p.m. There is one water inlet to the engine jacket, at the bottom of same, and a single outlet centrally in the head.

Digitized by Google



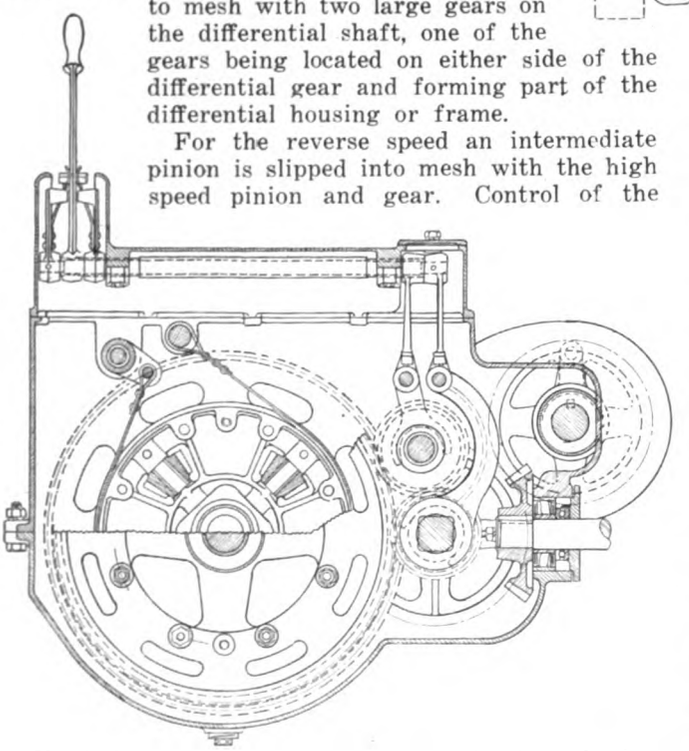
The engine is governed to run at a normal speed of 650 r.p.m. Its weight, including carbureter, magneto, manifold and fan, is 1650 lb.

Ease of adjustment is the feature of the clutch, which is of the band type. Adjustment may be effected by taking up on the anchoring screw. The clutch drum is an integral part of the flywheel and the band is lined with friction material. A cup and cone clutch brake is automatically applied upon release of the clutch, thereby facilitating the gear shifting operation. The male member of this clutch brake consists of a block of hardwood. Since the clutch is of the single band type, a counterweight is provided opposite the bracket supporting the clutch lever, to insure balanced running.



A short distance back of the engine is located the gear-box, whose shafts run transversely across the frame. Therefore, the pinion on the shaft entering the gearbox is of the bevel type, and it meshes with a bevel gear on the intermediate shaft of the transmission, effecting a reduction in the ratio of 3 to 2. Directly back of the bevel gear on the intermediate shaft is a spur gear which meshes with another spur gear on a shaft in the forward part of the gearcase. This shaft extends outside the gearbox and carries the belt pulley. Hence belt power is controlled by the same clutch as the motion of the tractor. The pulley is 17 in. in diameter and has a width of face of 8 in.; it runs at 528 r.p.m., giving a belt speed of 2350 ft. p.m. The intermediate shaft is squared over the greater portion of its length and carries a double sliding pinion, one of the pinions serving for the low gear and the other for the high gear. These pinions are adapted to mesh with two large gears on the differential shaft, one of the gears being located on either side of the differential gear and forming part of the differential housing or frame.

For the reverse speed an intermediate pinion is slipped into mesh with the high speed pinion and gear. Control of the change gear is effected selectively. All shafts of the transmission are of alloy steel, heat-treated and ground and the gears are of special gear steel and cut with stub teeth. All of the shafts are mounted in Hyatt roller bearings. The two forward speeds are 2 and 2¾ m.p.h., respectively, and the reverse speed is the same as the higher of the two forward speeds—2¾ m.p.h. The differential is of the bevel pinion type with four pinions and is so designed that all bevel gear thrust is self-contained.



The final drive to the rear wheels is by completely inclosed internal gears. The pinions of this gear are secured to the outer end of the differential shaft. The bull gears are centered on a turned shoulder on the drive wheel hubs, so that they are maintained perfectly concentric to the wheel, which permits of a correct mesh of the gears and pinions and of a silent and efficient drive. The bull gear, however, drives directly to the wheel rim through tension bars, thereby relieving the web of the bull gear and also the drive wheel of all torsional strain. Bull gears and pinions are completely inclosed by a sheet metal guard which telescopes the rim of the gear, making

a running joint between the gear and the guard. By the use of a special lining all dirt is excluded from the gear and efficient lubrication is made possible. The bull pinions are made of steel forgings and are hardened, and the bull gears are made of semi-steel.

The rear wheels are 54 in. in diameter and have rims 14 in. wide. They are mounted on Hyatt roller bearings on the stationary or dead rear axle. The latter is heat treated and ground, and is mounted in guide bearings which sustain the weight of the tractor through coiled springs. The front axle is of the automobile type, its main portion being of I section. Spring suspension is also provided for the forward end of the frame, the weight being carried on the axle through springs concealed in the frame, beneath the radiator. Hyatt bearings are used also in the front wheels, which are mounted on heat treated and ground steel knuckles. The hubs of all four wheels are provided with large grease chambers, an oil tight cap and end plate insuring perfect lubrication without the need of frequent attention. The front wheels are 36 in. in diameter and have rims 7 in. wide. A brake is placed on the housing of the differential gear. It is of the band type and operated by a pedal.

The frame is made of 6-in. structural steel of heavy section, and is reinforced by plates at both top and bottom flanges. All joints are hot riveted. The steering gear is of the worm and sector type and is inclosed in an oil tight case. A neat hood is provided over the engine which conforms exactly to the outline of the radiator and joins the wheel guards which are formed to line up nicely with it. It is securely held in place by spring clasps but can be easily and quickly removed.

The draw bar, which is spring cushioned, is located at a height of 15½ in. from the ground. The tractor has a wheelbase of 9 ft. and its total weight is 7800 lb.

New Instrument for Thermal Investigations

IN A PAPER published in a recent number of the *Revue de Metallurgie,* Pierre Chevenard describes a type of differential dilatometer which he has designed for thermal investigations on steels in connection with their heat treatment. He claims that this instrument is highly suitable for use in a steel works laboratory owing to the reliability and simplicity of its design. Only small quantities of metal are required; the instrument is easy to set up, and the readings are not affected by the vibrations which are unavoidable in a steel works laboratory. An instrument of the type referred to has been in use for some time for routine testing in a large steel works in France. It provides a useful complement to the chemical and micrographical examinations of certain steels. Finally, the instrument has proved useful in examining, qualitatively, slight modifications in the dilatability of metals owing to thermal or mechanical influences.

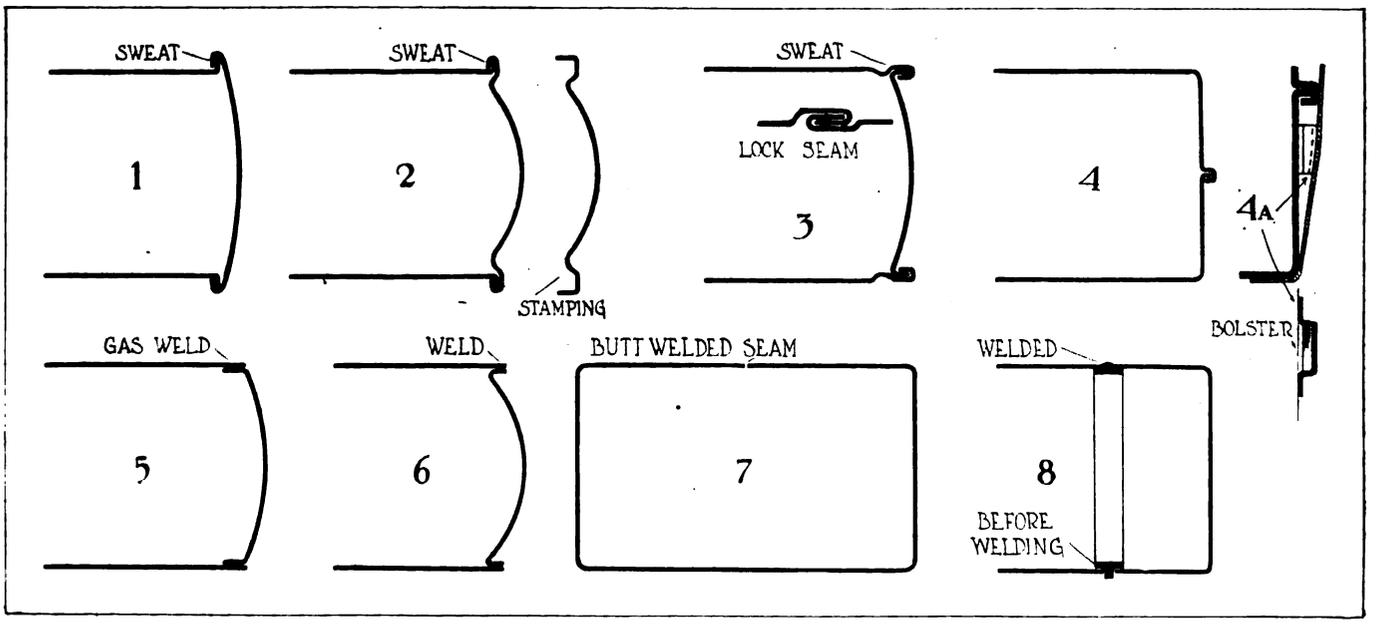
Fuel Tanks and Other Sheet Metal Parts

Tank Designs Worked Out by Geuder, Paeschke & Frey in Great Variety—Strong and Weak Points of Various Forms—Drawn Steel Oil Pans and Radiator Shells

FORMERLY the fuel tanks of automobiles were made from copper, riveted and soldered. This was a very expensive process because of the large amount of work involved. Copper was the material used, because it presents a clean surface and the solder flows well on it and adheres well. At the present time the commercial material for built-up type gasoline tanks is terne plate, which is sheet steel coated with an alloy composed of approximately 75 per cent of lead and 25 per cent of tin. The stock generally specified varies from No. 18 gauge to No. 22 gauge, the latter being used only where the tank is not exposed to injury. Where it is exposed it is better and quite usual practice to make the body of No. 20 gauge and the heads of No. 18 gauge.

There are numerous constructions of gas tanks, and the writer recently had occasion to discuss the subject with an engineer of Geuder, Paeschke & Frey of Milwaukee, who specialize in tanks of all kinds for use on motor cars, trucks and tractors, as well as in deep-drawn sheet metal stampings.

Forms of Seams Used



A few of the different types of construction are here described. The construction shown at 1 is unsatisfactory because the body of the tank is not properly supported. It will be noticed that the body is flanged out at the end—this being done in a flanging machine—and the convex head is then spun or beaded over the flange and sweated.

A better construction is that shown at 2. Here the head is pressed in the form shown on the right and is forced onto the end of the tank body. It is obvious that with such a tank there is much less likelihood of distortion from the cylindrical shape. The flange on the head is first spun over and the joint is then sweated as shown.

Another construction, and which is considered the best of all by the G. P. F. engineers, is that shown at 3. Here a small corrugation is rolled in the body sheet near the head to stiffen the body and support the head. The convex head with its outwardly turned flange is forced in, the edge of the body sheet is spun over and the joint sweated. One advantage of this construction is that there is no flange on the outside of the cylinder, so the tank can be put in a very restricted space. Also, the sweated joint is in a protected place. The form of lock seam used on the body of the tank is shown in the small sketch.

Baffle plates are sometimes riveted and soldered but generally only soldered. Of course, it is better to both rivet and solder them, as in that case all chances of their coming loose are eliminated. In the average 14-16-gal. tank, 12 in. in diameter by about 30 in. long, two baffle plates are usually specified.

Recently drawn tanks have come into use. These might be described as consisting of two deep pans joined together at their flanges. One advantage of the drawing process for making tanks is that it permits of irregular shapes as required in cowl tanks of great

Forms of seams and joints used in fuel tanks

Digitized by Google

strength. The drawn tank costs somewhat more than the ordinary built-up tank, but when a cowl tank is used no vacuum feed system is required and the saving thus effected may be made to more than offset the slight additional cost of this type of tank over one hung at the rear of the car.

Truck and Tractor Tanks

For truck and tractor purposes welded tanks of heavier stock, usually No. 16 gauge, are used. There are also several forms of construction in this line of tanks. The ends may be formed as shown at 5 or as shown at 6. There is probably very little difference between the two constructions as regards their merits, and it is largely a matter of taste—one engineer prefers one type and another the other. In both cases the tank body is supported on a wide circular ring. There are also two methods of making the longitudinal seams of these tanks. They may be either butt-welded, as shown at 7, or lap welded.

Cut 8 illustrates a distinctive Geuder, Paeschke & Frey construction. In this a T sectional piece of rolled material is provided to act as support. The web of the support extends slightly above the outside surface at first, but after being fused down, at the same time welding the body, head and reinforcement solidly together, it has practically disappeared.

Materials for Tanks

Tanks are furnished either in the black, galvanized or in terne coat. Baffle plates are usually omitted in truck tanks, on account of the low speed, the heavier stock used and the more rigid supports.

Designers of automobiles should realize the necessity of properly supporting the tank. Owing to the great weight of a full tank the stresses imposed on the supports at high car speeds are heavy, and the supports should be made of adequate strength to withstand the load and protect the joints of the tank. A rear-hung tank must not be supported too rigidly, as the frame weaves. Probably the best method is to use straps of 18 or 20 gauge steel about 1½ in. wide, lined with brake lining (or anti-squeak material). In the case of drawn tanks with projecting longitudinal seams, it is necessary to use bolster plates, as shown at 4A, to prevent the supporting straps from bending over the seams and breaking them open.

As an illustration of the troubles sometimes experienced with tanks and the reasons therefor, the engineer of the Geuder, Paeschke & Frey Co. told the writer of the following case: One automobile company received continuous complaints about end seam leaks in their fuel tanks, but the trouble seemed to be limited to the runabout and coupe models. An investigation showed that the spring clip hit the seam of the tank, which was due to lighter springs being used on these models than on the touring model, which permitted unusual deflection and side sway.

Soldered Seams Not Dependable

Solder should not be depended on to take strains, but only to act as a seal. The former applies also to spot welding. Where strains must be taken up rivets should always be used.

Gasoline tanks are made by the Geuder, Paeschke & Frey Co. both with and without sediment cups. If the gasoline feed tube enters at the top it is well to secure it at the bottom to prevent vibration. It has been found preferable to put the filler spouts on the body rather than on one of the heads. If the spout is placed on top of the body it is impossible to get an air trap and the tank can be filled full without difficulty.

Geuder, Paeschke & Frey have been specializing in deep drawing work since 1881. They confine themselves to drawings of light gauges, Nos. 10 and 11 being their heavy limits. Small drawings from heavy stock, such has hub caps, brake drums, rear axle housings, etc., are not made because the company's presses cannot be advantageously used for such parts.

Some of the automobile parts other than gasoline tanks which the firm is producing in great numbers are radiator shells, engine oil pans, gear covers, cylinder head covers, side cover plates, top water manifolds, flywheel housings, miscellaneous covers, rocker arm housings and pulleys for Vee belts. By reason of its electric spot and autogenous welding facilities in conjunction with its press and die sinking equipment the company can produce very complicated stamped and drawn assemblies.

Engine Oil Pans

Probably one of the most advantageous applications of deep drawing in automobile construction is in the production of oil pans for engines. In deep drawing the gauge of the metal is practically not changed. A drawn steel oil pan weighs about the same as an aluminum pan, but is much cheaper to make and, besides, it is practically indestructible. It can be dented, but the dent can be hammered out again.

A great deal of drawn work requires to be rust-proofed in some way, and if several parts are assembled they must be rust-proofed after assembling, for riveting and similar methods are apt to injure the rust proofing. This applies particularly in the case of oil pans for engines. Geuder, Paeschke & Frey either terne coat or galvanize the pans after assembly. After the pan has been galvanized or terne coated, it presents an ideal surface for soldering on fittings, so that the pan is made oil tight. The fittings that must be secured to the pan include drain flanges, gauge fittings and oil supply fittings. A starting crank bracket casting may be riveted and sweated to the timing gear cover in this way and thus provide a most satisfactory substitute for the grey iron or aluminum casting formerly used.

As regards interchangeability, drawn steel parts compare very favorably with machined castings. They are formed and perforated on dies and are fully interchangeable. All are inspected, of course, before leaving the plant.

Cork Gaskets Used

Wherever an oil-tight joint is required a cork gasket 1/16 in. thick is used, and is shellacked either on one side or on both sides. It is claimed that a properly designed stamping will not give any more trouble from oil leakage than a machined casting. The usual practice in connection with pressed steel oil pans is to let the end opening edges enter into grooves on the bearing caps, which are packed with felt. Some firms, however, machine the end openings of the stampings to exact dimensions and fit them against the bearings.

Drawn steel radiator shells are now very extensively used on passenger cars, except on cars of small production, which do not warrant the tool expense. The use of a pressed steel radiator shell reduces the cost of the radiator, because it makes it unnecessary to finish the core all over; it protects the core and tanks and yet makes them more accessible for repairs. Also, it is more in harmony with the finish of the rest of the car. Many car builders buy their radiator cores and shells separately, in which case they avoid the risk of damage in transportation and they enamel them them-

Concerning Wire Rope for Aircraft

Wire Must Show High Elongation as Well as Great Tensile Strength—Tricks in Wire Drawing Permit of Obtaining High Breaking Strength at the Expense of Toughness

IN *Aeronautical Engineering* for Jan. 9, J. and W. Ker Wilson discuss the subject of wire ropes as used in airplane construction. They express the belief that eventually it will be possible to make flexible cable in streamline form, and to dispense with the unreliable streamline solid wire. Wire rope is frequently the weakest link in strong engineering structures. The material should not only have sufficient strength, but also sufficient elasticity to withstand the severe stresses imposed upon it. In the authors' opinion, elasticity is fully as important a property as tensile strength, and a tensile test alone is not sufficient for judging the wire. There is a possibility that in the future a simple form of streamline fairing will be developed, which will eliminate the so-called "vibrant strains." Not only does the fairing reduce the vibration and consequently the strain upon the wire, but it greatly reduces the resistance to motion. It is claimed that a small wire vibrating rapidly offers as much resistance to motion as a flat surface as wide as the amplitude of the vibration.

Hardened by Drawing Process

All rope specifications should provide for not only torsion, bending and tensile tests of the individual wire after drawing, but also for the material in rod form before drawing. Wire rope of the requisite quality can not be produced from cheap material. The following practice is to be absolutely condemned. A manufacturer starts with low carbon rod, anneals it and instead of drawing it down by one-half to one-quarter gage sizes, pulls it down to the required size in steps of 1½ to 2 sizes. The stresses thus imposed upon the material harden the wire at the cost of elasticity. If tensile strength is the only test called for, such a wire may pass. In one instance a manufacturer ordered 120-ton quality wire from his wire drawer to show 135 to 140 ton tensile strength in individual wire form. The idea was that such abnormal wire would show a high tensile strength when made up into rope form, with a straight-pull test, and so satisfy inspection. With proper inspection no wire showing a greater breakage stress than 125 tons would be accepted. The authors emphasize that, in the future, specifications of wire rope must not only demand a certain breaking load but also specify the elongation.

Hardness may be further intensified by very high machine speed in stranding and closing the rope. If the elastic limit is not exceeded in the drawing operation no hardness results, but if the drawing subjects the material to stresses beyond the elastic limit, a certain amount of permanent set is produced and hardness is the result. The more the stress exceeds the elastic limit the greater the hardness. Of course, in all wire drawing the elastic limit is exceeded.

Hardness can be kept within reasonable limits in three ways, viz., (1) by giving careful heat treatment during manufacture; (2) by carefully drawing down the wire by one-quarter to one-half

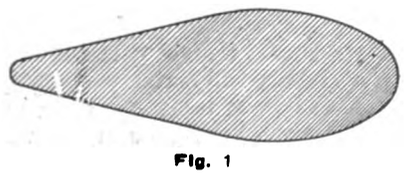

Fig. 1

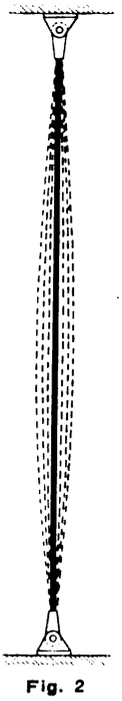

Fig. 2

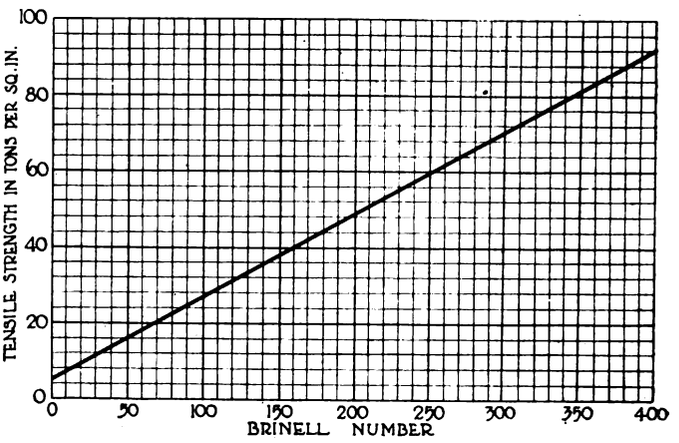

Fig. 3

sizes; (3) by using durable speed (moderate) for stranding and closing the rope. A certain amount of hardness is desirable, because, for a given weight, hard-drawn steel wire will support a heavier load than the untreated steel; but it must always be remembered that the increased tenacity has been obtained at the expense of elasticity, and the hardening should never be carried so far that the material becomes dangerously brittle. Fig. 3 shows how hardening the material raises its tensile strength and reduces its elasticity, or what is more correctly called its plasticity.

The authors made a study of the relation between the Brinell hardness numbers of drawn steel and its tensile strength. This relation may be very closely expressed by the following equation:

Tensile strength in tons per square inch = 0.213 Brinell number + 5.

In the report of the hardness test research committee Dr. Unwin stated that the ratio of tensile strength to hardness number was very nearly 0.325.

Stranding Produces Stresses

As previously pointed out, the usual practice in stranding wire is to draw the wire at high speed through imperfectly made machines, thereby subjecting the wire to terrific stresses. The wire is drawn from the spools through the closing die, thence around a large diameter drum and so on to a take-off reel. Unbelievable though it may seem, when drawing high tensile wire, the same speed is used as in stranding ordinary mild steel wire. It is the opinion of Messrs. Wilson that many failures of high tensile wire in service can be traced to the terrible stresses imposed on individual wires when being laid together and stranded at high speeds. The same criticism may be passed upon the operation known as closing, when the finished strands are laid together and twisted into rope form. Frequently, the wire forming the crown of the rope—the outside wires—are cut during their rapid passage through the closing die sufficiently to reduce their strength individually 50 per cent.

Steel rope intended for stranding members on aircraft need not possess as much flexibility as inner and outer drag wires, lift wires and diagonal bracing. These wires could be Lang's Lay instead of the ordinary Lay, the strands and rope being laid opposite and so causing additional stress.

For a test of wire ropes in the finished form the authors recommend the following: The load is run up to 25 per

Digitized by Google

cent of the guaranteed breaking load and is then taken off, when the permanent set can easily be measured with an ordinary rule. This operation is repeated for loads of 50 per cent and 75 per cent and finally the breaking load itself is determined. An extension of 5 per cent to 10 per cent on a length of about 25 in. should be insisted upon. Care must be exercised to insure that the initial straightening out of the strands is not measured as extension. To this end one-sixth of the breaking load is allowed for straightening out the wire. The ultimate tensile strength is then 6/5 of the value recorded by the testing machine.

It is recommended that the Air Board provide for analysis, tensile and bend tests of the steel in rod form before the manufacture of wire begins. A very searching torsion test should be made of the finished individual wires and of course also a tensile test. The specifications should also include a maximum rate of speed for all machinery forming high tensile wires into strands, to safeguard against over-stressing the wire at too high speed. Further, the sequence of gage sizes through which the wire is to be drawn might be specified, as well as the limiting hardness after drawing.

—

Increasing Oil Recovery from Sands

A COPY has been received of Bulletin 148 issued by the Bureau of Mines and dealing with methods for increasing the recovery of oil from oil sand. J. O. Lewis is the author of the bulletin. According to Mr. Lewis's investigation, less than 50 per cent of the oil in the average field remains unrecovered when the field is abandoned as exhausted. In the bulletin referred to are considered the principles involved in increasing recovery and methods of extracting more oil from the oil bearing formations than by the usual ways of producing. These methods are: The use of gas or vacuum pump, forcing compressed air or gas through the oil bearing formations, displacing the oil by water, and better utilization of the natural pressure in the oil bearing formation. Special attention is being given to a process—commonly known as the Smith-Dunn—for forcing compressed air through oil bearing formations.

—

Aspect Ratio and Critical Angle

IN a recent issue of *Engineering* C. H. Powell discusses the influence of the aspect ratio on the critical angle of inclined surfaces, which problem has a bearing on airplane design. In the case of a flat plate inclined to a wind it is known that there is a certain angle of incidence at which the lift or cross-wind force is a maximum. This may be called the critical angle. Mr. Powell refers to some experiments made by M. Eiffel on planes of aspect ratio varying from 1/6 to 9* and from these experiments he calculated the values of the critical angle for each plane. These are plotted against aspect ratio in Fig. 1, which shows very clearly the following experimental fact: The critical angle increases as the aspect ratio diminishes according to a definite function.

In view of the natural unsteadiness of the air flow usually experienced at the critical angle it is remarkable that a smooth curve can be drawn through as many as six points out of the eight. Supplementary to this, investigations at the National Physical Laboratory on a long inclined wire, which approaches zero aspect ratio, show that the normal force is very nearly proportional to $\sin^2\alpha$, where α is the angle of incidence, Fig. 2, *i.e.*,

$$N = N_{90} \sin^2 \alpha$$

roughly. This is quite in accordance with the foregoing, and it also appears that the nearer we approach to an infinitesimally small aspect ratio, or, the closer the inclined edges of a plane approach together and mutually affect each other, the more nearly will the normal force be proportional to $\sin^2\alpha$. It is interesting to note that Newton deduced this *sine* squared law for a purely hypothetical fluid.

An investigation is made of the value of the critical angle for the case where the normal force is coincident with the resultant and varies as $\sin^2\alpha$.

*"La Resistance de l'Air et l'Aviation, 1911," pages 44-134.

Let L represent lift and N normal force, then

$$L = N \cos\alpha = N_{90} \sin^2\alpha \cos\alpha$$

For maximum value of L we have by differentiating and equating to zero:

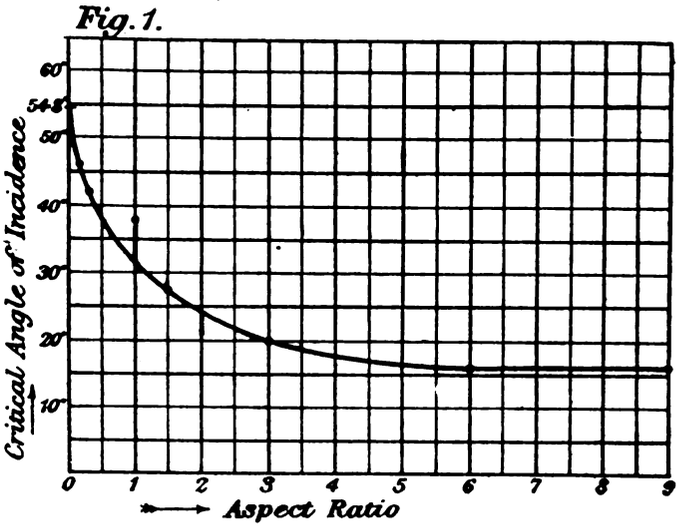
$$\frac{dL}{d\alpha} = N_{90} [2 \sin\alpha \cos^2\alpha - \sin^3\alpha] = 0$$

Whence

$$\text{Sin}\,\alpha = \frac{\sqrt{2}}{3} = .817$$

or

$$\alpha = 54.8 \text{ deg.}$$



This angle is marked in Fig. 1 in the position for aspect ratio → zero.

It must be understood that variations in speed have also a considerable effect upon the critical angle. In the case of higher speeds than that of the experiments a curve would be obtained similar to, but probably slightly above that in Fig. 1, still, however, passing through 54.8 deg. for zero aspect ratio; while for lower speeds the criticals would occur at lower angles.

The practical importance of high critical angles from an airplane designer's point of view is that a control surface, such as a rudder or elevator of high aspect ratio, will not give any further effect on the airplane after about 20 deg., whereas it is desirable for special maneuvers and "taxying" that the control surfaces should give a cross wind force increasing with angle throughout their range of movement, which at the present time on most machines is generally not greater than 40 deg.

The arrangement of having the controls as being part of the fin or tail, as the case may be, has the effect of increasing the critical angle because the aspect ratio of the combined surface is lower than that of either movable surface alone. There is no particular advantage of having the directive organs and control surfaces of a very efficient type usually associated with high aspect ratio. The main point is that they should respond evenly to the joy stick and rudder bar movements.

Digitized by Google

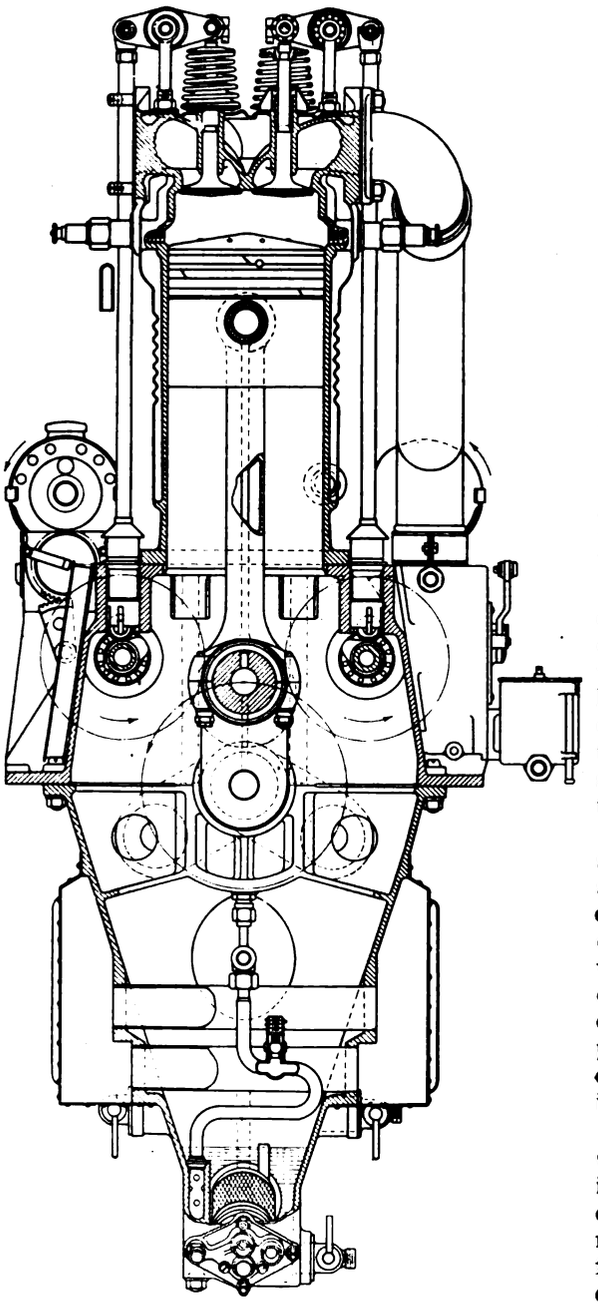
The Benz 230-Hp. Aircraft Engine

Has Cast Iron Cylinder and Head Castings in One Piece and Sheet Steel Jackets—Four Valves Per Cylinder Operated from a Camshaft in the Crank Case



A FURTHER instalment of data on enemy aircraft engines has been issued by the British Air Board, this covering in very great detail the Benz 230-hp. engine. The design is in many respects similar to the 160-hp. engine of the same make described in a recent issue and the weight efficiency is almost exactly the same, viz., 3.68 lb. per horsepower. Owing to the strong trend in the direction of increased power this larger engine is, of course, of the greater interest. The illustrations are reproduced from the *Automobile Engineer*.

The 230-hp. Benz engine, 145 mm. bore by 190 mm. stroke, as fitted to the Aviatik biplane, follows the usual German practice for aircraft engines of this type. It is a six-cylinder vertical water-cooled layout, each separate cylinder bolting to the crank case by long studs which pass through the top half of the crank chamber and secure the crank-shaft bearings between the top and bottom halves.

Two inlet and exhaust valves are fitted in the head of each cylinder, and they are operated through overhead valve rockers mounted on ball bearings, the rockers being actuated by push rods on either side of the cylinders in the usual manner. The two camshafts, which run in plain bearings, are, as usual, arranged inside the top half of the crank case, and the floating exhaust camshaft carries the usual half compression cams.

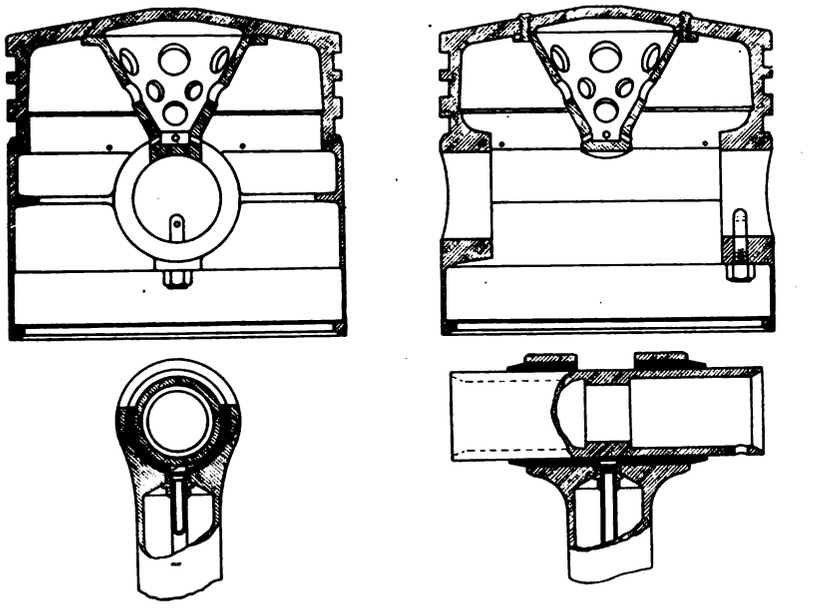
The pistons are of cast iron, fitted with three exceptionally wide rings, and the piston heads, following usual Benz practice, are supported by conical steel forgings riveted and welded to the piston crown, these supports bearing on the center portion of the gudgeon pins through slots cut in the connecting-rod small ends.

As in the 160-hp. Benz engines, two separate two-jet carbureters are fitted, each having its air intake passages through the top half of the crankcase casting. The carbureters supply three cylinders each, through independent branched induction pipes built up of light aluminium tube.

Transverse section through engine

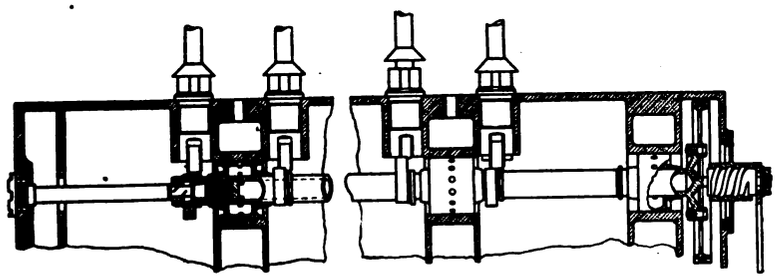
The lubrication of the crankshaft and connecting rod bearings is effected by a gear pump of very interesting design, which works in an auxiliary oil reservoir formed in the bottom of the air-cooled base chamber.

An oil-sealed fuel pump supplies gasoline to the carbureters in conjunction with a supplementary pressure reservoir enclosed in the main fuel tank. The pump is driven off the rear end of the inlet camshaft, the same driving spindle also operating the machine gun interrupter gear and the tachometer drive.



Except for the steel water-jackets, the cylinders are entirely of cast iron, the water-jacketed heads, including the twin inlet and exhaust valve passages, being cast integral with the cylinder bodies.

Pressed steel water-jackets are fitted, these being built up in half sections and welded together at the vertical joints. At the bottom they are welded to flanges machined on the outside of the cylinders. The cylinder walls are taper, being 5.5 mm. at the base and 6.5 mm. at the top. Exceptionally long water-jackets are arranged, these extending to within 45 mm. of the cylinder base flanges. Seven annular corrugations are formed about the center of the jackets to allow for expansion, and three transversely in the jacketing over the heads. The general construction of the cylinders and jackets with their water connections is clearly shown in the various illustrations.



The arrangement of the water space in the cylinder heads and around the valve pockets is well carried out, and, in addition, dished plates are welded in the water space above the crown of each cylinder to deflect the flow of water on to the exhaust valve pockets. The diameter of the cylinder head water connections is 60 mm.

The cylinder registers extend well into the crankcase top, being 10 mm. deep, and the cylinder flanges are held by four 12 mm. studs and also by dogs at four points. The dogs are pulled down through long studs that pass through the top half of the

The tubular connecting rod

crank chamber and are screwed into the bottom halves of the main bearing housings, cast integral with the base chamber. The portions of the holding-down studs that screw into the aluminium are of larger diameter and of coarser pitch. The nuts that secure the holding-down dogs are of interesting design, being of circular cupped formation drilled radially with four 12 mm. holes for application of the "tommy bar." The total weight of each cylinder, complete with valves, valve springs and valve rocker supports, is 44.25 lb.

Pistons

The pistons, with the exception of the small conical pillars, are entirely of cast iron, and weigh 7.62 lb. each, complete with rings and piston pin. Three rings are arranged above the piston pin, the lower one being a scraper ring. Each ring is 8 mm. wide, and the width of gap when fitted is .45 mm. The two top rings are 4.25 mm. apart, while the scraper ring is 10 mm. below; 4 mm. diameter pins are provided to locate the radial position of each ring, and six 2 mm. holes are drilled equally spaced around a slight annular recess below the scraper ring.

The hollow conical pillar supporting the piston head is machined from a steel forging, and is riveted in place, as shown in the sections of the piston. The lower end of the pillar, which is finished in position at the same time as the holes in the piston pin bosses, bears on the center part of the piston pin, and to accomplish this a portion of the top of the connecting rod small end and piston pin bush is cut away. By this construction the greater part of the force of the explosion is transmitted from the head of the piston to the connecting rod.

The piston pins are 38 mm. diameter, bored with a 30 mm. hole at the ends, while the center portion is bored 25 mm. for a length of 20 mm. where the conical piston head support bears. The diameter at the top of the piston is 144.15 mm., and at the bottom 144.67 mm. The piston ring side clearance is 0.004 in.

Connecting Rods

In general design these are fairly orthodox, as will be seen from the illustrations. The whole of the rod, including the lugs for the four bolts securing the halves of the big end, is machined all over from a steel forging. The outside diameter of the rod is 36 mm., and a 30-mm. hole is bored from the crank pin end to within 6 mm. of the piston pin bush, the hole being closed at the big end with a threaded plug. The big end itself is lightened by four 12 mm. holes and one 30-mm. hole drilled radially.

A 6-mm. steel pipe, for lubricating the piston pin, is fixed inside the center of the connecting rod, the pipe being supported in the center by two flanged discs, as shown in the illustrations. Two semicircular oil grooves are machined in the white metal big end bearing caps, and one lateral groove is cut in the top of the big end bearing. The total weight of the complete connecting rod is 7 lb. 1 oz., the big end weighing 4 lb. 12 oz. and the small end 2 lb. 5 oz. The total big end side clearance is 0.15 mm., and the float of the small end bush between the piston pin bosses is 14 mm.

Crankshaft

The six-throw crankshaft runs in seven plain bearings; it weighs 109.25 lb., including the propeller boss, and the cranks are, of course, set at 120 deg.

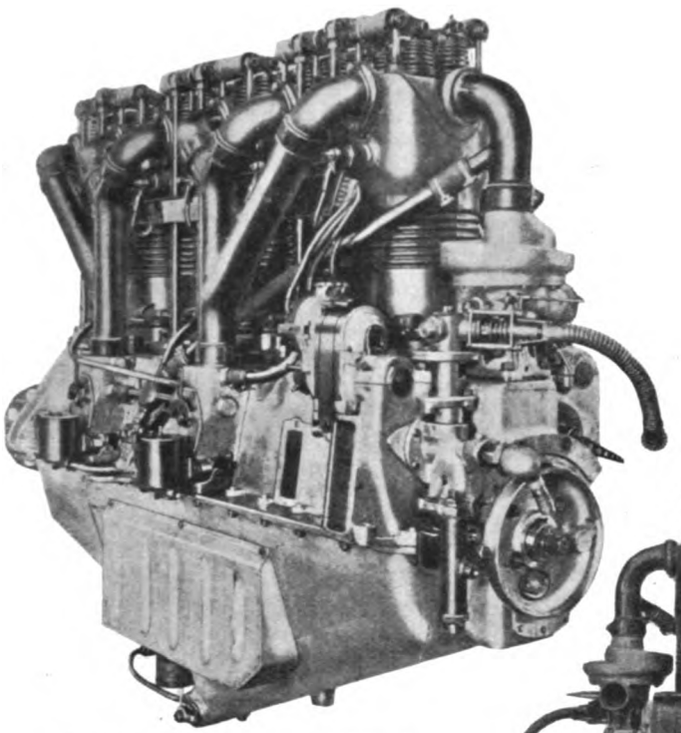
Digitized by Google

The diameter of the journals is 62 mm., while that of the crank pins is 60 mm. The length of the front journal bearing (propeller end) is 79 mm., and the length of the other journal bearings is 54 mm., with the exception of the rear end bearing, which is 55 mm.

The crank pins and journals are bored, the webs being drilled with communicating lubrication holes in the usual manner. The diameter of the holes bored in both the crank pins and journals is 27 mm., and the ends are plugged with sheet steel discs sweated into the recessed ends. All the discs which plug the rear ends of the holes in both the crank pins and journals are drilled with a central 5 mm. hole to provide a certain amount of splash lubrication for general purposes.

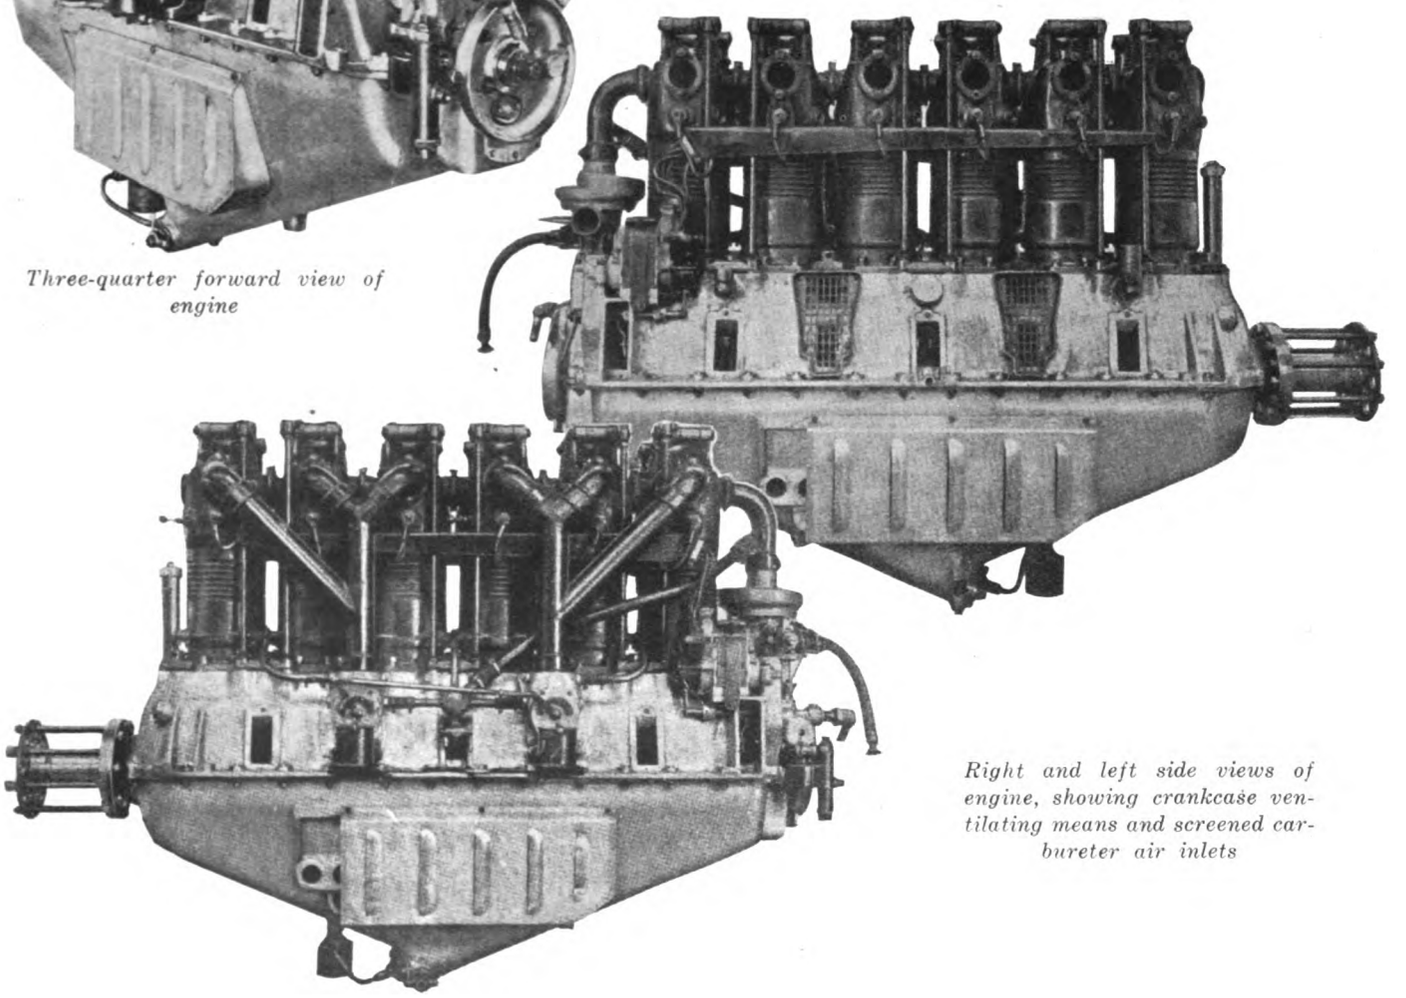
A double-thrust ball race, 120 mm. diameter, is fitted at the front end of the crankshaft behind the front flange to which the propeller hub is bolted. The thrust races are large enough to be assembled over the cranks, and are secured in position by a split collar which is screwed on to the crankshaft. The halves of the split collar are held together on the shaft by an undercut shoulder on the crankshaft which engages a recess in the split collar.

Fitted to the rear end of the crankshaft is a friction clutch for transmitting the wireless drive, the control being so arranged that the clutch can be operated from the pilot's seat. The propeller boss is coupled to the crankshaft by a flange which bolts to a corresponding flange on the end of the crankshaft; eight 14-mm. bolts are fitted.



Valves and Valve Gear

The twin inlet and exhaust valves are arranged vertically in the cylinder heads, and, as previously mentioned, are actuated through rockers mounted on ball bearings that are carried by supports screwed into the cylinder head.



The rocker lever actuates the valves through hardened steel rollers, mounted on eccentric bolts; these, in conjunction with adjustable spherical joints screwed into the top ends of the vertical push rods on each side of the cylinders, give a fine adjustment for the tappet clearances. Spherical joints on the valve rockers are provided to simplify the alignment of the valve rocker supports which are screwed into the cylinder heads.

Semi-spherical ends are arranged at the bottoms of the push rods, which work in steel cups inside the hollow tappets. Hardened steel rollers are fitted to the tappets, which are slightly offset from the camshaft centers. Each pair of tappet guides is held in position by a steel dog.

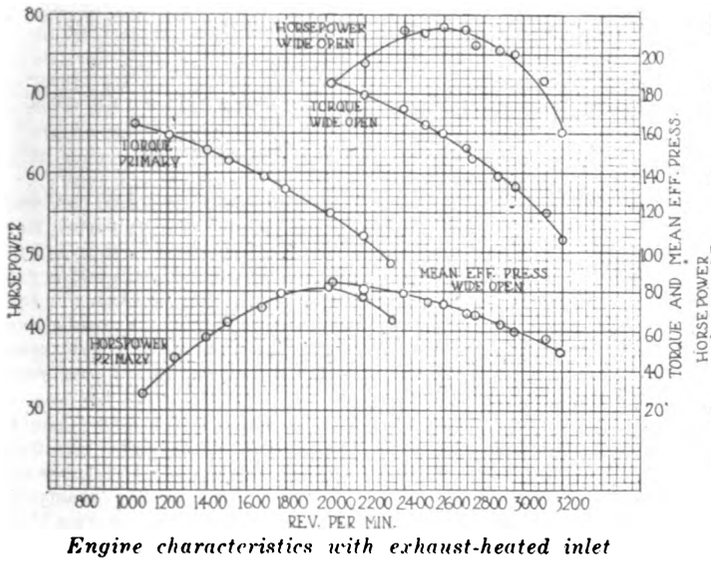
Changes in Peerless Eight and Reasons Therefor

SINCE the introduction of the Peerless eight-cylinder engine two years ago, some important refinements have been made, notably in the valve action and in the layout of the accessories. The sectional views give a general impression regarding the refinements which it has been possible to make in the light of experience and advanced practice.

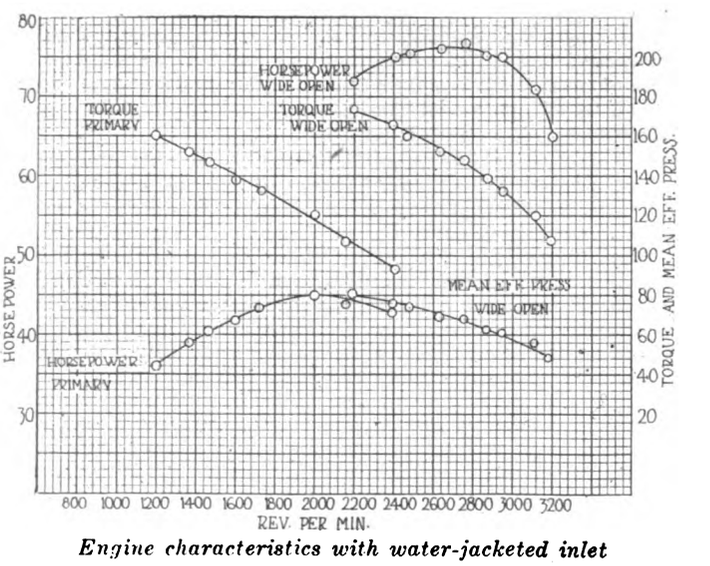
Probably the most radical change is in the valve action. The rocker arms formerly employed have been eliminated by inclining the valves, and at the same time water-jacket space has been gained and the valves are actuated directly by roller followers on the cam. This change in the valve action has necessitated alterations in both the crankcase and cylinder block castings, and, while adding a little metal to these, has more than compensated for this by greatly simplifying the valve action. By the old method a rocker arm was used, pivoted at one end and carrying a roller follower between this pivot point and the point at which the rocker arm engaged the push rod. Thus the action of the cam was multiplied to some extent, owing to the fact that the follower was closer to the pivot center than the point of contact with the valve push rod.

The valve mechanism as it stands now is lighter and simpler. Hollow tappets are used, with an increased amount of bearing surface and better adjustment features. The combustion chamber has been slightly altered in shape, this being made necessary by the valve entering it at an angle.



Another important change is in the mounting of the tire pump, which has been removed from the side, where it was driven by an extension of the fan shaft, and is now bolted in front of the engine and connected with a clutch to the camshaft. Formerly it was connected by means of wing nuts, as it had to be removed in order to render the valve action accessible. With the present arrangement the inside of the V is rendered much more clear and it is not necessary to touch the tire pump.

A great many other minor changes have been made to increase accessibility and facilitate manufacturing operations. For instance, the crankcase oil-gage cock operating handle has been brought up so that it is now on a level with the top of the cylinder, whereas it was formerly much lower and rather difficult to reach.



It is interesting to note the results which are obtained from a power plant of this capacity. The cylinders are 3¼ x 5 in., set at 90 deg. The S. A. E. rating is 33.8 hp., but the actual brake horsepower is approximately 80 at 2700 r.p.m. Two sets of curves are given herewith, one set showing the results with a water-jacketed inlet heater, and the other with exhaust heated inlet. Both are with a 1⅛ in. double standard Ball & Ball carbureter, with 66-67 primary jet and 54-57 secondary.

The two carbureter ranges are clearly brought out on these curves. With the primary, or lower running range, the maximum horsepower developed is 45 at 2000 r.p.m. The primary torque is above 160 ft.-lb. at 1000 r.p.m. on the primary range, and above 180 ft.-lb. at 2000 r.p.m. on the secondary, or wide-open range. The mean effective pressures are also plotted against r.p.m. for the wide-open range of the carbureter and show a pressure of around 85 lb. per sq. in. at 2000 r.p.m. These readings are all taken off the exhaust-heated inlet chart, and, as will be noted, are quite closely approximated in the other chart which shows results obtained with the inlet water-jacketed.

The Ball carbureter used on this engine is shown in Fig. 3. It is a two-stage instrument, the primary operation being taken care of by means of the air inlet *A* and auxiliary air spring valve *B*. The gasoline for the primary action enters through the jet *C* by means of the venturi *D*. For the secondary range, the throttle *E* is opened by means of a connecting link with the throttle above the mixing chamber, bringing into action the jet *F* and an additional supply of air through the opening *G*. There is also an acceleration well with a pick-up plunger at *H*, giving a quick supply of gasoline when the throttle valves are opened suddenly. Under normal conditions, the primary jet *C* is a No. 65 drill hole, and the secondary a No. 58. For higher altitudes, from 68 to 70 may be used on the primary, and No. 60 on the secondary.

Advantages of a Hand-Controlled Air Valve

By Charles E. Manierre

THERE is, of course, every reason at the present time to save as much as possible in the use of gasoline. The rising price of this commodity is the least of several reasons which need not be specified. Each of the various ways in which gasoline is wasted is worthy of consideration, and the stoppage of waste in each direction saves just so much of the fuel.

The particular loss which is at the moment considered is that sustained while the car is descending a steep grade and the engine is being used as a brake. Of course the throttle is closed. As a matter of fact, it is well understood that a so-called closed throttle is partly open. In truth it is so far open that the engine is capable of idling with the throttle in that position. Moreover, while idling, the spark is much retarded and therefore the engine is performing at a great disadvantage and also turning very slowly.

Far more mixture is drawn in through the "closed" throttle at touring speed. In fact it has been stated by one investigator that enough gasoline was consumed to run the car at the rate of 20 m.p.h. on a good level road. However that may be, it must be evident that an appreciable portion of gasoline is wasted.

There is but one apparent remedy for this loss, and that remedy is a sufficiently large opening in the intake manifold above the carbureter, which can be controlled from the dash. The necessary size of this seems to be the equivalent of what would be needed for a ⅜ or ½ in. pipe. When this opening is uncovered very little suction would be evident past the gasoline needle valve, particularly when the throttle is closed.

All authorities agree that the use of the engine as a brake does it no harm and is a proper and sometimes a vital and necessary procedure.

In a country of steep hills a very considerable saving should result from the use of such an opening in the manifold.

There are now upon the market a variety of devices to be installed upon the intake manifold, some of which supply only water and others of which supply in addition or exclusively either a fixed or a variable amount of air. A considerable saving of gasoline is claimed by all of these devices. It is probable that all of them do make such saving, and for two reasons. The water, whether in the form of steam or liquid, tends strongly to keep down the quantity of carbon formed in the cylinders and perhaps to cause it to assume its powdery amorphous condition. Certainly an engine supplied with sufficient water even at irregular intervals is capable of keeping up its efficiency and this naturally results in a very considerable saving of gasoline.

So far as these devices automatically admit air, they may be regarded as supplemental to the carbureter and they become practically a part of it, and must receive due consideration in the adjustment of it.

Whether the air opening in these devices is adjustable, either by hand or automatically by a spring, or not, the device constitutes an auxiliary air valve and it has this marked peculiarity, that it is above the throttle and only indirectly subject to the effects of throttle opening and closing. In fact, the closing of the throttle, which diminishes the suction of air below, increases the suction at these auxiliaries.

At high speeds, with open throttle and with some forms of carbureters, the extra air supplied by these auxiliaries is exactly what is not wanted, and this is true also of moderate speeds where the car is upon a slight up grade.

The best results in the running of the car can only be obtained by governing these openings from the dash by a driver sufficiently skillful to know when the valve should be opened, and how much, and equally important, when it should be closed.

There seems to be on the market to-day no carbureter so arranged as to obviate the advantages of the use of such a valve. The effort of all carbureters has been to obtain a mixture of gasoline and air of a fixed proportion to be delivered to the cylinders under all circumstances, the only choice to the driver being to set the instrument either slightly rich for the greatest power, or a little lean for the greatest economy. This arrangement does not take into consideration that very usual condition of running, in which the throttle is nearly closed and the cylinders take in a minimum quantity of the mixture on the suction stroke, and therefore a mixture much under atmospheric pressure. The compression stroke following is partially ineffective, starting as it does with gas below normal pressure, and the burning of the gas under this diminished compression is not as satisfactory as it would be if the mixture were slightly more lean and a measured quantity of additional air had been allowed to go into the cylinders and thus increase the compression.

The carbureter proper cannot supply this air but a hand controlled auxiliary device on the manifold can, and under the circumstances mentioned actually permits a greater spark advance than is otherwise possible.

Such a device when opened slowly but fully, and if of sufficient capacity, has also the effect of stopping the explosions in the engine. But it does this gradually, diminishing the force of successive explosions, as contrasted with the cutting off of the spark, which brings them to a sudden stop. And likewise, upon slowly closing such a valve, the first explosions are weak and increase smoothly in power, whereas the sudden cutting in of the spark brings a full strength explosion and the strains incident thereto.

In using such a device the sudden wide opening of the air valve is apt, at least with the older form of engines, to sweep into the cylinders a quantity of liquid fuel contained in the manifold and to produce the exact opposite of what the driver intends, *i.e.*, the engine speeds up when he intended it to cease its explosions, and if the clutch is out it races. Likewise the sudden closing of the air valve, when the car is not moving at a suitably high speed, will put a great strain on the clutch and differential mechanism—the counterpart of starting in high gear.

These are both, of course, abuses of the machine, but a careless or an incompetent driver can produce both of these abuses in other ways, and there should therefore be no objection to the use of the device.

Power Generator That Won't Work

By Joseph E. Bissell

IT was with interest that I read your editorial on one Garabed's free power device. I mean your editorial was interesting. Now won't you be so kind as to give your attention for a moment to the device here illustrated and while you are doing it forget all about perpetual motion, so that you can approach the subject with an unbiased mind. I would like you to publish the sketch in your periodical and ask your readers to explain why it will not function after being once brought up to speed.

I tried a small clumsy model and timed it the best I could. I found that it would run 10 sec. longer in the right direction than it would run backwards, which was a very favorable indication. Considering the fact that the mercury seems to squirt out between the shaft at the top bearing, it seems that the mercury stands practically perpendicularly.

Digitized by Google

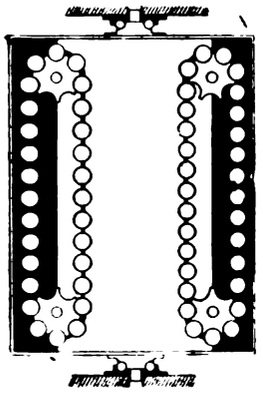

Diagram of the device

Now, if the apparatus, with a radius of 6 in., is spun at 2000 r.p.m., why will not the mercury stand up? And if the balls are as heavy as the mercury, why will they not bear down on the inner side as they hang in the air? If we took the two inner rows out altogether then the two outer rows would not move at all, but stand still, because, weighing the same as the liquid they are immersed in, there is no tendency for them to either rise or sink or move in any direction whatever.

Please look at this seriously. If you are the man who wrote that article I feel quite sure you will. It makes no particle of difference what "they" say; I want to learn the principles of the thing and that is the reason I would like your readers to cast a bias eye at it—not a biased one, though.

Ans.—There are two ways of looking at this proposition, but whichever way you look at it, you arrive at the same result—namely, that there is no reason whatever why there should be any tendency for the chain to turn its sprocket. Disregarding the mercury for the instance, one-half of the chain exactly balances the other half. You will say that owing to one-half of the chain being immersed in mercury and the balls being lighter than the mercury, there will be an upward buoyancy on the balls or chains. This is true. However, there are other effects which neutralize this. The buoyancy results from the fact that the pressure of the mercury increases with the depth and therefore is less on the top surface than on the bottom surface of any ball. The additional force referred to is the lateral buoyancy as the balls enter and leave the mercury. The pressure of the mercury against the half-excluded ball is much greater than the pressure of the air. Even when the ball is completely immersed in the mercury there is a radially inward buoyancy force on the balls, as the pressure within the mercury due to centrifugal force increases from the inner surface to the outer surface, the same as the pressure due to the weight or to gravity increases from top to bottom.

Let us look at the problem from the standpoint of work done by and upon a ball in passing through the mercury. First, to get the ball entirely into the mercury at the bottom, you have to do work upon it, the same as you have to do upon a piece of wood to submerse it in water. The ball in rising through the mercury from its lowest to its highest position, by reason of the buoyancy of the mercury, is capable of doing a certain amount of work. As a result of the pressure of the mercury upon the ball as the latter passes out of the vertical layer, the ball is capable of doing an additional amount of work. The work which must be done upon the ball to get it into the mercury at the bottom is equal to the sum of the amount which the ball is capable of giving out due to its rise in the mercury and the amount of work due to its exclusion therefrom, consequently the ball will give out only as much mechanical energy as has been expended upon it, leaving no surplus. This result is arrived at by neglecting the friction. Owing to the friction of the balls in the mercury some of the energy given to them is converted into heat and the mechanical energy they are capable of giving out is therefore even less than that imparted to them.—Ed.

University Course for Personnel Managers

New Course of Instruction Designed to Give the Training Required to Men in Charge of Factory Help Opened at Columbia

PERSONNEL management has become a very important phase of factory administration during the past few years. The development of industry on a large scale and the growing strength of organized labor have created a demand for resourceful, wide-visioned, and trained men to handle the human problems arising in the big industries of the country.

The head of the personnel work in a large plant to-day should know the experience of other plants in dealing with their industrial relations problems and the history and purposes of trade unionism, and he should be able to apply this knowledge in the light of the particular circumstances of his own organization.

Columbia University, New York City, has established a course to investigate the complicated problems which personnel managers are called upon to solve. This class, which started Feb. 8, is intended for those who are in the administration end of factory labor departments, for executives who wish to extend their knowledge of methods of meeting employment problems, and for men or women who expect to enter the field of personnel management.

The course will first of all attempt to establish a human point of view toward labor. This sounds academic, theoretic; but it is rather of the utmost practical use. The personnel manager must first of all shape a definite policy, subject to change if it proves unsatisfactory, toward his employees. His methods of carrying out that policy are a comparatively minor matter. Labor's demands are by no means always a matter of dollars and cents. The demand, for instance, is frequently made for the union shop as a matter of principle, without regard to the wage scale. Should the union shop be recognized? What has happened where it has or has not been recognized? How will it work out in any given industry? For settling practical questions such as these, the personnel manager should first have a "point of view," as the announcement calls it, toward labor. In other words he should have a definite attitude toward his subject based on a clear understanding of his employees both as an organization and as individual human beings.

Industrial Relations Work Analyzed

Industrial relations work, represented by the establishment of clubhouses, benefit associations, athletic fields, clubhouses, has been introduced into many large plants. In some cases the experiments have been failures, in others successful. More frequently the projects have been partly satisfactory and partly objectionable. The original "welfare" idea which started this type of work has been practically done away with. The employees will not stand for anything that sounds like charity, and whatever is done in respect to providing recreation and health facilities for the workers must be offered on the principle that it is a partial wage equivalent and a stimulus to greater production. The concrete experiences of industrial relations work in different plants will be used to show how policies of this nature may be worked out.

Labor turnover will be discussed, together with methods of record keeping, and analysis of turnover costs. In connection with the selection of employees existing methods and systems will be considered; and the underlying elements of a sound method will be studied. Successful experiments in the manner of selecting new workers who will "make good" have been carried out at various plants, and these will be brought to the attention of students in this class.

Handling grievances is a job that bothers every labor executive and one that has dynamic possibilities for either the good or the evil of the organization. The stories of men who have been able to solve the question of "kicks" and discharges harmoniously will be used to indicate principles which personnel managers may apply in their own factories.

Ordway Tead, a partner in the firm of Valentine, Tead, & Gregg, industrial counselors, is the instructor in the course which will meet every Friday evening at Hamilton Hall on the university grounds.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Standards and Competition

IT appears that some tractor manufacturers look askance at the proposal to introduce standardization in their industry, believing it to be a scheme of the automobile manufacturers to annex the tractor business. It is not only likely that automobile manufacturers will enter the tractor field, but some of the largest of them—Ford, Olds and Maxwell—are already actively engaged in it. However, the entrance of these firms into the tractor field was not in any way related to the standardization plan. All the firms mentioned are among the largest producers in the automobile industry, and they will no doubt operate on a large scale also in the tractor industry. Now, it is a well known fact that standardization is of the greatest benefit to the small and moderate-sized firms. Where a machine is produced on the scale of the Ford car, there is little advantage to the manufacturer in having parts or fittings interchangeable with similar parts on other cars, as the parts have to be produced in such enormous quantities that the pro rata tool cost is insignificant. This is borne out by the fact that the Ford car uses fewer S. A. E. standards than probably any other car made in this country.

If standardization served to help outsiders to enter an established industry, it is not likely that automobile manufacturers would have supported it in their own field so whole-heartedly. It tends to enable the smaller concerns to hold their own against the larger ones, and there have been instances of leading firms in some parts lines opposing standardization, but when carried out rationally standardization has so much inherent merit that even this strong opposition could not stop its progress.

Let no one be deceived as to the future course of the tractor industry. If farming conditions favor the tractor so that the demand can be greatly increased, new firms will continue to enter the industry and will make a bid for patronage in competition with the older firms. Sooner or later the supply will catch up with the demand, competition will become keen and some of the weaker firms may be forced to the wall. This, however, is the natural course of development for any new industry, which cannot be altered by ostrich methods such as antagonizing rational standardization.

Starter Mountings

ONE thing that mitigated against the success of electric starting and generating apparatus on automobiles in former years was that inadequate provision was made in the design of the engines for mounting the starters and generators. By extensive experimentation a method of mounting was finally arrived at which seemed to be superior to all others, and its advantages were so generally admitted that it was standardized by the S. A. E. It is known as the flange mounting, the starter or generator being provided with a substantial flange at the driving end by which it is bolted to the flywheel housing or the timing gear housing. The flanges are provided with pilots to locate the starter or generator accurately in a bored hole in the housing if gear drive is used, but in the case of chain drive for the generator the pilot is given a certain amount of play and adjustment can be made by means of slots in the flange for the two upper bolts, which permit the machine to be swung toward and away from the crank axis around the axis of the lower retaining bolt.

Electric starting and lighting apparatus is rapidly being adopted in motor boat work, especially in connection with large engines which are difficult to start by hand. In fact, some manufacturers specializing in large engines have made it a rule not to sell them without starters, for the reason that if hand cranking is relied upon the owners soon meet with difficulty and in consequence rather heavy demands are made upon the service department.

Unfortunately the avidity with which marine engine manufacturers have taken to the starter is not an index of the good judgment shown by them in mounting the device. This was plainly evident at the recent motor boat show and the evidence is reproduced in this issue in the form of two pages of sketches of starter and generator mountings which one of our artists drew at the show. In most cases it is quite plain that these electrical machines were

Digitized by Google

not considered when the engines were first designed, but were after-thoughts.

Next to the flange mounting the clamp mounting is probably the best, as it permits of quick removal and replacement of the machine, and—if well worked out—holds it securely. At the present time not all marine engines fitted with electric starters have their flywheel enclosed, so the flange mounting is not universally applicable. However, the practice of enclosing the flywheel is gaining ground in marine practice and it can hardly be denied that a flywheel with a gear crown for starting should properly be enclosed. Generators also are best driven by enclosed gearing, even though marine engine men do not have to provide against road dust. Therefore, it is to be expected that the flange mounting will eventually also prove best for marine engines.

At present there are only two sizes listed by the S. A. E. for both starter and generator mountings, and these were worked out for automobile service. For marine work, in which low-speed engines up to several hundred horsepower output are used, the mountings have to be larger, and it is to be hoped that through co-operation between the marine engine division and the electrical equipment division of the Standards Committee, the list of standard mountings will be extended in the near future so as to cover the heavier marine practice.

Aerial Mail Service

EVERY one of the large nations hopes that after the war practical uses may be found for aircraft which may warrant keeping in operation at least some of its large works for aircraft production. Millions upon millions are being invested in buildings, machine tools and special equipment, and if all of this plant had to be liquidated at the end of the war the loss would be enormous. Consequently there has been a great deal of speculation as to possible commercial uses of aircraft, and several papers on the subject have been presented to British aeronautic bodies.

The chief attribute of the airplane being its speediness, its greatest possibilities seem to lie in the transportation of mail matter. Our fastest trains make only about 50 m.p.h. average over long distances, and this can be more than doubled by the airplane. The advantage of such fast mail service is very considerable to business, and would be especially appreciated in times like these when trains are oftener hours behind schedule than on time.

A serious attempt to introduce an aerial mail service between New York, Philadelphia and Washington will be made next summer, calls for bids for suitable machines having been issued by the Post Office Department. It appears from an announcement made by the Department that the practicability of the scheme will be fully determined before the service is really begun. This we take to mean that a considerable number of trips back and forth will be made with equivalent loads to determine the reliability of the machines and the competency of the operators before any regular mail will be carried. To make the plan feasible, it was necessary for the War Department to release the necessary number of aero engines, but this was probably done gladly because anything tending to expedite the transaction of business between these important centers will facilitate the work of that Department.

Kerosene Carburetion

IT is quite apparent from the discussion at the recent Minneapolis S. A. E. section meeting that, although practically all modern farm tractors are being sold as kerosene-burning, they are far from burning this fuel satisfactorily in the service of farmers. Many tractor engineers (and perhaps also carbureter engineers) in the past have proceeded on the theory that a tractor engine works substantially under constant load, and though this assumption has some foundation in fact, there still is enough variation in the load to cause difficulties in the way of carburetion.

To effect vaporization of the kerosene in the exceedingly short period of time available for the operation, it must first be very finely divided by spraying. When kerosene thus finely divided is mixed with the proper proportion of air it will either remain in the liquid state, as a mist, or become gasified, according to the temperature and pressure of the mixture. High temperature favors gasification, as does low pressure. But both high temperature and low pressure mean a rarefied charge, low volumetric efficiency and small maximum horsepower from an engine of given dimensions. Thus it does not seem to matter much whether gasification of the fuel is induced by raising the temperature or by lowering the pressure of the charge as it enters the cylinder—the effect on the output is equally detrimental.

If the fuel is not finely divided by spraying but is emitted from the nozzle in relatively large drops, as will happen under a weak suction, then, of course, the difficulties of gasifying it are greatly enhanced. This is due to the fact that the rate at which heat can enter a globule of the fuel is proportional to the surface area of same, which latter varies at a lesser rate than the volume. Therefore, even though the temperature and pressure conditions in the cylinder during the suction stroke are such as to permit of the existence of dry gas, liquid fuel may still get into the cylinders if the spraying pressure is too low. If the fuel could be sprayed by means of compressed air or gas under a pressure of several atmospheres, controlled in proportion to the throttle opening, very fine division of the fuel could be insured under all conditions. This, however, would necessitate the shutting off, by automatic means, of either the nozzle or the air pressure upon the fuel whenever the suction ceased, and would entail serious complications.

The use of a well-regulated heat supply together with the most energetic spraying possible with the engine suction seems to be the simplest solution of the problem. The best method of heat supply and regulation remains an open question.

Automotive Show Draws 178,270

Automotive Idea Triples Attendance at Twin Cities—Tractors the Best Card

MINNEAPOLIS, Feb. 9—After running seven days, the Twin Cities automotive show held in the large Overland storage building came to a successful close to-night with a total attendance for the week of 178,270 as compared with an attendance of 67,000 a year ago. The present figures entirely dispel any question as to the necessity of war shows, and they also indicate how desirable it is to have an automotive show; that it, one with cars, trucks, tractors and the thirty-two other applications of the internal combustion engine, which were on exhibition.

It was the broad automotive idea that was responsible for the unprecedented crowds, and undoubtedly next year the Twin Cities people will have a better representation of motorcycles and airplanes, as well as motor boats and small stationary gas engines, all of which fall within the automotive sphere.

During the middle of the week the greatest interest was in tractors and trucks, and the forty different tractor makers present did a good business. There were retail sales and many agencies were placed. One tractor maker admitted selling 70 per cent of his output through motor car dealers, or automotive dealers as they will soon be known. Several of the largest Minneapolis distributers have recently taken on tractor accounts and are planning a campaign with the 150,000 Minnesota farmers and the farmers of the Dakotas and Montana.

Estimates of show sales mean more at the Twin Cities show than they do at a Chicago or New York show, and reports of at least 200 tractors being sold give some indication of the interest. The fact that over 5000 dealers were registered by Thursday night was the best proof of the increased interest in the show. These dealers came from all parts of the four States that make up the 400,000 square miles of Twin City territory, an area that is roughly six times as large as the six New England States combined; an area larger than all of France or all of Germany. This area would accommodate all of our 104,000,000 people and the population per square mile would then be only about as dense as in the State of Massachusetts.

The truck show did not attract so generally as the tractor show, due perhaps to the greater novelty of the tractor. Truck sales were made, but in relatively small numbers and these were confined to the Twin Cities. Various estimates have been made as to the value of car sales, figures going as high as $1,000,000, but nothing definite can be computed further than that there were many retail sales and not a few dealer accounts closed.

The growing importance of the Twin Cities in automotive circles was emphasided by the Society of Automotive En-

Ford to Make Complete Liberty Engines

Packard Now in Production—Marmon and General Motors in 30-60 Days

WASHINGTON, Feb. 12.—The Ford Motor Co., Detroit, will be the largest single producer of Liberty airplane engines. Although the company has been producing only cylinders, under a new program the engines will be made complete. The Ford company has so perfected the processes of manufacturing cylinders that a saving of from 40 to 50 per cent in their cost has become possible. According to its contract with the government, the Ford company is entitled to but 25 per cent of the saving, the remainder going to the government.

It is understood that the Ford company will commence the production of complete engines this month. Already the Packard company is in production on 12-cylinder types. It is expected that the Nordyke & Marmon Co., Indianapolis, and the various General Motors Co. divisions will be in production in from 30 to 60 days.

—

Class AA Trucks Going to Washington

WASHINGTON, D. C., Feb. 12—The four Class AA Quartermaster ¾-ton war trucks assembled by the Willys-Overland Co., Reo Motor Car. Co., Maxwell Motor Co., and Federal Motor Truck Co. are en route to Washington and will probably arrive here Thursday morning, Feb. 14. The trucks reached Pittsburgh last night and left there this morning for Chambersburg, Pa.

—

Eidlitz to Direct Housing of Labor

WASHINGTON, Feb. 12—Otto Eidlitz, a New York architect, has been appointed Director of Housing by the Department of Labor. He will direct a huge program for housing labor other than that engaged on ship building. Congress has been asked for an appropriation of $50,000,000 to carry on the work.

Tractor Makers Work at Capacity

Twin Cities Makers All Are Rushed—Many Companies Add to Their Plants

MINNEAPOLIS, Feb. 9.—Tractor makers in the Twin Cities are working at capacity and factories are being added to in order to speed up production as fast as building work can be pushed. Emerson-Brantingham is adding a stock warehouse, the steel framework of which is up. The company has 600 employees working exclusively on tractors and will produce approximately 3,000 machines this year. A new engine testing room with eleven engine test stands is being fitted up. In this test the engines will be run with their complete tractor equipment including radiators.

The Minneapolis Steel and Machinery Co. which manufactures the Twin City tractor has just completed a new testing laboratory fitted with a 100-hp. Sprague electric testing dynamometer. There are two testing stands one at each end of the Sprague unit so as to admit of having two engines worked on, one under test and the other being prepared for test or otherwise used as needed. The Sprague unit is made for 100-hp. at 500 r.p.m. and will serve for high speed work up to 2,000 r.p.m. The new building is a brick structure, with tile floor and fitted with all modern conveniences.

The Gray Tractor Co., busy with export orders has already shipped 160 tractors to France, has forty more awaiting shipment and a large order yet to complete. The company is assembling two machines per day at present.

The Wilcox-Bennett Carbureter Co. maker of kerosene carbureters and the Bennett air cleaner for tractors and trucks is busy on both of these devices.

—

Mobilize Schools to Train Soldiers

WASHINGTON, Feb. 12—Secretary of War Baker has organized a committee to mobilize the various schools and colleges of the country, including automobile schools to give technical training to soldiers. It is estimated that 100,000 soldiers will be trained in these schools in the next 6 months. The committee is composed of: Col. Hugh S. Johnson; Lieut-Col. Robert Rees; Major Grenville Clark; Dr. Charles R. Mann, Massachusetts Institute of Technology; Dr. James R. Angell, dean of the faculty of the Western Electric Co.; J. P. Monroe, Boston, and Dr. Samuel Capen, Washington.

Airplane Mail Route Planned

Government Wants Round Trip a Day Between Washington, Philadelphia, New York

WASHINGTON, Feb. 12—An airplane mail service between Washington, Philadelphia and New York with a schedule of a round trip per day will soon be in operation, according to plans made public to-day by Postmaster-General Burleson.

The Post Office has asked for bids for construction and provision of the five airplanes to be used in the establishment of an air route for delivery of first-class mail. It is expected the service will be greatly increased later.

The War Department has arranged to release a sufficient number of Hispano-Suiza 150-hp. engines to equip the planes. Bids will be open Feb. 21 and the contract will be awarded to the bidder whose machines meet the service tests of the War and Navy Departments.

The airplanes and parts are to be delivered at such points in Washington, Philadelphia and New York as the Post Office designates not later than April 25. The contractor will also be required to furnish in addition to the five planes a sufficient stock of spare parts and to have in reserve a sixth airplane. He must detail to the Post Office Department a supervisor for 3 months to try out the aviators and mechanics in the operation of the planes.

Stipulations include that the machines must be capable of carrying 300 lb. of mail matter a distance not less than 200 miles without stop, maximum speed of 100 m.p.h., minimum of 45 m.p.h., and climbing speed of 6000 ft. in 10 minutes.

The Government will make a special postage rate not exceeding 25 cents per ounce for the transmission of mail by the air route, and will guarantee to observe a regular time schedule.

Congress has already made an appropriation of $100,000 for preliminary steps establishing airplane postal service.

Postmaster-General Burleson states that once the scheme is established it will remain a permanent service.

Favor Daylight Saving Bill

WASHINGTON, D. C., Feb. 11—The daylight saving bill was given a favorable report by the House Interstate Commerce Committee Saturday. The bill has already passed the Senate and it is expected to find no opposition in the House. As amended, it makes daylight saving effective from March 30 to Oct. 30, during which period an extra hour of daylight will be obtained by turning the clock back one hour.

Washington News Letter

Transportation Under One Head—No Word on Fuel—Rubber Exports Licensed—War Department Reorganized

WASHINGTON, D. C., Feb. 11—Washington is seething this week with undercurrents reported to include radical changes in handling of army trucks, considerable discord between individuals and companies in the industry, and rumors that imports and exports will be subject to regulation. There is also an undercurrent pertaining to fuel as regards the industry and which carries reports of personal interest and internal difficulties.

As has been told frequently, the truck business of the army now is more or less chaotic. The standardized war trucks of the Quartermaster Corps, really the army war trucks, have not been taken up by all departments, with a result that there are numerous makes of trucks, and various other so-called standardized trucks with the attendant confusion.

Complaints this week have been received from tire makers who point out that there is no standardization of tire sizes; for example that the 1½-ton signal corps truck carries a tire that does not correspond in size with the standardized A truck. In addition there have been complaints of duplication of effort created by the separate truck divisions.

A fairly substantial report this week is to the effect that all of the motor transportation work of the army, including design, procurement and maintenance, will be first under one head. The report has it that the head of this work will be an automobile man working as a civilian under a high army officer.

It is quite likely that Christian Girl, chairman of the motor truck section of the Quartermaster Corps and president of the Standard Parts Co., Cleveland, will

(Continued on page 387)

Farm Tractors Follow Automobile Design

Kansas City Show Reveals Reduction in Weight and Inclosure of Parts

KANSAS CITY, Feb. 12—The third annual farm tractor show opened here to-day with forty different makes of tractors, exhibited in a special one-story frame building erected for the purpose and which is a great improvement on the tent used for the last 2 years.

The present show is one of the largest tractor exhibits ever staged in this country and while the majority of the leading makers are represented there are several important makers not here.

The exhibit shows a very great change in design in the last year, the two most notable lines of improvement being:

1—Reduction in weight and,

2—Inclosing of parts to protect them from water and dust.

The influence of automobile design is plainly seen in many new models and in improvements on old models. There is shown a new Trojan tractor which might be designated as the first tractor built with a live rear axle design and with all parts as completely inclosed and in which use is made of 60-in. rear driving wheels yet without pressure on the teeth of the gears higher.

Tendency Toward Four Wheels

In a word what was declared a year or two ago as the impossible in tractor design has been accomplished. In this Trojan tractor is used the Foote gearset and rear axle and rear wheel design, and as the Foote company manufactures parts for all concerns wishing to buy them there will not be any restrictions on the new design shown here for the first time.

There is a very marked tendency toward the use of four wheels instead of three, and the single front wheel in tractors is almost at an end. It is rumored that some of the important concerns using the single front wheel have new designs in which two front wheels for steering are used. There is also a notable tendency toward the use of larger diameter front wheels for steering.

The reduction of weight is very apparent in not a few models. One concern which has a new model which is not shown here has succeeded in cutting 2200 lb. out of its tractor which has largely been done by a new design of gearset in which forged gears are used and by improving the design of the rear wheels and both axles. The weight has not been

Kerosene Burning Problem Discussed

Heat Supply Must Be Regulated to Maintain the Volumetric Efficiency

MINNEAPOLIS, Feb. 9—That the ordinary hotspot manifold or double manifold does not fully solve the problem of burning kerosene in tractor engines was the consensus of opinion among engineers attending the regular monthly meeting of the Minneapolis Section of the S. A. E. held here on Wednesday evening and concerning which a short report appeared in AUTOMOTIVE INDUSTRIES.

Professor Mowry of the State Agricultural College took the stand that the increased use of kerosene and heavier fuels is more dependent on engine designers than on carbureter or manifold makers. A questionnaire addressed to 400 tractor owners in Minnesota brought out that none of them was using distillate or motor spirit in his machine. The majority replied that they used kerosene, less than 12 per cent using gasoline, except for starting. That many of these owners are not satisfied with the performance of their machines on kerosene was indicated by the fact that only 40 per cent of them agreed that they would recommend tractors to their neighbors. This was apparently not due to the cost of maintenance, because Professor Mowry showed figures in which the average maintenance or repair cost for 200 tractors in the state, all of which were less than 3 years old, was $28.05 per tractor, an unexpectedly low figure. No figures were given to show the average number of days these machines worked per year.

University Tests

Professor Mowry quoted figures from tests made by his university on keresene fuel with hotspot manifolds. The tests were made with a four-cylinder, L-head engine with a removable head and the duration of the tests was 1 hr. Water temperatures ranged from 190 to 212 deg.

The test with the Clapper manifold was made at an engine speed of 750 r.p.m. and the dilution of the crankcase oil due to kerosene cutting the oil film on the cylinder walls and getting past the piston into the crankcase was 0.1 lb.

With the Holley vaporizer the engine was run at 850 r.p.m. to get the same horsepower and the crankcase dilution was 0.7 lb.

With the Duplex manifold an engine speed of 820 r.p.m. was necessary to give the power and the crankcase dilution was 0.3 lb.

In some manifold tests the engine did not run the 1 hr., but stopped after 35 min. due to pre-ignition.

W. G. Clark, engineer of the Wilcox-Bennett Carbureter Co., maker of the Bennett kerosene carbureter, and who has just returned from a 3-months investigation trip among tractor farmers from Texas to Montana, in opening the discussion declared that the situation with the farmer so far as burning kerosene in tractors is concerned is much more serious than tractor makers generally imagine, due to tractor makers selling tractors that are supposed to burn kerosene satisfactorily but which fail to do it in the service of the farmers: As a result farmers in many sections are beginning to look with disfavor on kerosene as a tractor fuel.

Mr. Clark held that tractor makers are apt to rely too much on laboratory testing and experimentation methods, rather than getting out into the field. He claimed that the hotspot manifold is not the solution of the kerosene problem, because it increases the temperature of the mixture too much and cuts down the volumetric efficiency of the engine so that from 25 to 30 per cent of the engine power is lost.

Farmers Complain

He cited examples of farmers complaining to tractor makers that their tractors would not handle kerosene although advertised to do so, and quoted letters in which these tractor makers practically admitted that they would not, by recommending to the farmer that he use gasoline instead.

Spark plugs are giving very satisfactory service, Mr. Clark citing cases where plugs had been used for 2½ years in a tractor without changing.

With regard to lubricating oil the consensus of opinion of those engineers present was that the lubricating oil that is best for the burning of gasoline is best for kerosene, and that where very heavy oils are used with kerosene it is just that they will withstand the action of unburned kerosene a little longer and so postpone the dilution of the crankcase oil. Oils with good viscosity were recommended.

E. R. Greer, engineer of the Emerson-Brantingham company, thinks that the hotspot manifold to accomplish its object must have some form of heat control. Consideration must be given to the speed of travel of the mixture in the manifold as well as the temperature of the manifold. When there are high gas speeds with open throttle less heat is needed; in fact, you want to get the gases in as cool as possible in order to keep your power up; but when the throttle is closed on light loads and the manifold gas speed is cut down you must have added heat to prevent loading up.

—

More Power for Automobile Industries Committee

WASHINGTON, Feb. 9—Directors of the Motor and Accessories Manufacturers Assn. met in Washington last week to discuss means of enlarging and broadening the scope of the Automobile Industries Committee. No definite decisions were reached and a second meeting is to be held Thursday, Feb. 14, in New York, which will be attended jointly by directors of the Motor and Accessories Manufacturers Assn. and the National Automobile Chamber of Commerce. The Automobile Industries Committee believes that its functions can be more efficiently handled and its results greatly augmented by the addition of efficiency experts, plant surveyors and production men to its present organization. This is one of the matters being handled by the directors of the M. & A. M. A. at the present meetings.

—

No Fuel Restrictions on St. Louis Show

ST. LOUIS, Feb. 11—Fuel restrictions have been withdrawn from the St. Louis Automobile Show, to be held in the Exhibit Bldg., Feb. 18-23. The 30,000 sq. ft. of floorspace required were allotted last week to dealers, and preparations for the opening are going forward rapidly.

—

Jordan to Add $200,000 Capital

CLEVELAND, Feb. 13—A 50 per cent increase in the production of Jordan cars, made possible by a largely increased demand and the immediate acquisition of $200,000 additional capital, and the placing of Jordan stock on a definite dividend-paying basis, is part of a plan announced after a meeting of the board of directors following the annual stockholders' meeting held last week.

Jordan has, during the past year, done a business of approximately $3,000,000 on a working capital of $300,000 producing and selling more than 2000 Jordan cars.

In the last quarter of 1917 Jordan earnings amounted to 16.7 per cent on the capital, which is equivalent to 66.8 per cent for the year.

The expense incident to starting a new business, putting a new car on the market, and establishing Jordan reputation has now been absorbed, and the earnings as shown by the last quarterly statement have been satisfactory.

The new plan provides for the sale of $200,000 of preferred stock now in the treasury, with one-half share of common stock given as a bonus with each share of preferred. This stock would be fully paid and non-assessable. The preferred stock now held by the original stockholders, together with the new preferred issue, will be placed on a 7 per cent annual dividend basis, to be paid quarterly. The new issue will first be formally offered to the present stockholders who may subscribe pro-rata to their present holdings. In the event that the new issue is not all taken by them it will then be available to new subscribers. The control of the Jordan company remains in the hands of Mr. Jordan and his working associates.

—

Strikes Reduce Copper Output

WASHINGTON, D. C., Feb. 11—The Mediation Committee appointed last spring by President Wilson, states in a report that the strikes during the summer in Arizona resulted in a loss of one hundred million pounds of copper.

England Restricts Use of Gas

Substitute Motor Fuel Is Limited to Owners, Who May Also Use Gasoline

LONDON, Jan. 9—By a new order issued to-day, the use of gas for motor cars and trucks has been limited to those cases where it is legal to use gasoline as a motor fuel. This ruling represents another curtailment on the industry. It was thought that coal gas might be used since it allowed the conservation of gasoline, but the government has apparently decided to restrict the use of automobiles, irrespective of the fuel used.

On Feb. 9, a still further curtailment order is expected to go in force. On that date a motorist must decide whether he will use coal gas or gasoline as a fuel. In other words, after Feb. 9, if your permit allows you to use gasoline, then you cannot use coal gas and vice versa.

This new ruling suggests a possible development in automobile fuels which will continue after the war. There are some sections of the country in which the use of gasoline may cease entirely, particularly those where gas is plentiful, such as bituminous coal mining areas. There the voluminous gas bag will undoubtedly disappear and the steel cylinder take its place. With the use of steel cylinders and compressors, coal gas will be carried more easily than gasoline, and in such sections, coal gas may supersede gasoline as a fuel. It is not likely that the gas bag will disappear during the period of the war, due to the difficulty of securing steel cylinders.

Another aspect to the post-war fuel situation in England is the possibility of using benzol. There will be gigantic supplies of benzol when the war is over, because the huge plants which have been put up to produce this satisfactory fuel are now doing war work only, but afterward it should sell at a lower price than gasoline.

—

Standard Parts Holds Midwinter Meeting

CLEVELAND, Feb. 11—Increased output and standardization were the principal subjects discussed at the midwinter meeting of plant and production managers of the Standard Parts Co., held in the Hotel Statler, Feb. 4 and 5. In order to prevent delay or cancellation of orders for the goods which were damaged in the fire at the Cincinnati plant, it was decided to divert this work to other plants of the company, and likewise to transfer the Cincinnati workmen to other factories for the time being.

Company executives and managers of other departments joined the production men at the midwinter dinner. Addresses were made by Christian Girl, president of the Standard Parts Co.; E. J. Hess, vice-president; T. E. Borton, treasurer; P. A. Connolly, secretary; Dan C. Swander, sales director; W. C. Keys, acting engineering director; and H. H. Newsom, director of purchases. W. E. Perrine, director of production, presided.

—

Overland-Curtiss Union Increases Engine Output

BUFFALO, Feb. 11—A large output of engines for training planes is the result of the close manufacturing union of the Willys-Overland Co. and Curtiss Aeroplane & Motors Corp. The January output of Curtiss engines by the Willys-Overland company was 110, and in addition the Buffalo and Hammondsport Curtiss plants turned out 400, making a total well in excess of 500.

At present Willys-Overland is turning out more than 15 engines of the OX type daily, and when the Elyria (Ohio) plant, which has hitherto been devoted to the manufacture of Knight engines, swings into production about the middle of February, the total will be greatly augmented.

Under the expanded manufacturing schedules the Overland and Curtiss plants should produce jointly in February between 750 and 800 engines. Within 60 days it is expected that they will reach a stride of 1000 a month.

—

Detroit Has 118,489 Industrial Employees

DETROIT, Feb. 13—According to the report by the Michigan Labor Commission, the automobile industry employs practically 50 per cent of the industrial employees in the six largest Michigan cities. Detroit, alone, employees, 118,489; Flint, 18,262; Lansing, 7875; Jackson, 4683; Muskegon, 2847; Pontiac, 5747.

—

Loans Urged for Tractors

COLUMBUS, OHIO, Feb. 11—That farmers who want to purchase tractors should be given preference in loans was urged upon all Ohio bankers by Philip Berg, state superintendent of banks. He says that large crops are a war necessity, and that "worthy farmers should have the fullest line of credit, consistent with good banking principles, for the purchase of farm tractors."

—

Government Requests Airplane Device Ideas

WASHINGTON, Feb. 11—The National Advisory Committee for Aeronautics has invited all inventors of airplanes or airplane equipment to submit their ideas. A comprehensive outline of the proposed device, with necessary data, and the results of any tests that have been made, should be sent to the committee. All suggestions of inventions will be considered confidential, and those of merit will be turned over to the proper officials, with suitable recommendation. A special sub-committee has been formed to examine these inventions, and it is suggested that inventors obtain scientific and technical advice before taking the time of the government for ideas which violate scientific laws or are contrary to the best aeronautic practice.

Ford Starts Work on Sub-Chasers

Keel of First Boat Already Laid—Side Frames Ready to Go Up—Designed in 10 Days

WASHINGTON, Feb. 9—Henry Ford laid the keel for the first of the new type patrol boats to be built in the Ford plant yesterday. The side frames are ready to go up.

Secretary Daniels made public to-day a number of details regarding the Ford contract. In December, Henry Ford offered, by letter, to build naval vessels in his plant. A few hours after the letter was received a telegram was sent requesting Mr. Ford to come to Washington for conference. A few days later Mr. Ford and his staff went into consultation with officials of the navy, following which the Ford party went to Philadelphia to inspect shipyards and plants. They returned to Washington for further consultation, and on Dec. 31 had the preliminary plans and specifications of the boats to be built. Several days later complete plans were delivered to Ford, who on Jan. 15 telegraphed his proposition to Secretary Daniels, and in return received a contract for a large number of the boats. Rear Admiral C. W. Dyson representing the Bureau of Steam Engineering, and Naval Constructor Robert Stocker, representing the Bureau of Construction and Repair, are in Detroit assisting Mr. Ford.

The Ford company, according to Secretary Daniels, is pushing construction at a rate that will probably exceed all previous records for building steel naval vessels.

The new type of patrol boats being built by Mr. Ford was designed in ten days. A model was made and tested at the Washington navy yard before the placing of contracts.

—

Goodyear Must Pay $750,000 Tax

COLUMBUS, OHIO, Feb. 11—The Goodyear Tire & Rubber Co., Akron, must pay the Willis tax of 3/20 of 1 per cent on its $50,000,000 increase of capital, a total tax of $750,000. This decision was made by Attorney-General Joseph McGhee, who ruled that when a corporation files an increase of capital within 6 months prior to the time of filing the annual report, that part of the increase which is subscribed, or issued and outstanding at the time the report is filed, must be taken into consideration in computing the franchise tax.

—

Marshall Vice-President of Jones

WICHITA, KAN., Feb. 11—Deering J. Marshall has been elected vice-president of the Jones Motor Car Co., and John Engstrom has been made a new director to fill the place of J. W. Farmer, resigned.

Chicago to New York Truck Line

Master Truck Transportation Co. to Operate Motor Freight Fleets on Schedule

CHICAGO, Feb. 12—Details of the arrangements for the Chicago and New York truck service of the Master Truck Transportation Co. indicate very thorough preparation for maintaining the movement of truck trains on schedule. As previously reported, this new service is to operate a freight line between Chicago, Buffalo and New York, and the first fleet of 24 2-ton Master trucks is expected to be ready for the pioneer trip as soon as the weather conditions permit. Some idea of the thoroughness of the preparations will be gained from the fact that the fleet will have with it one truck devoted entirely to carrying oil and gasoline for the convoy, another is equipped as a kitchen to prepare meals for the drivers and mechanics en route, while a third will carry tents and sleeping equipment for the men. It is designed to eliminate the necessity for depending upon any hotel or restaurant accommodations.

According to General Manager Goldman, this method of freight transportation will be sufficiently popular for it to become general with other truck concerns, as already the new company just formed has had requests from more Chicago and New York manufacturers to make deliveries between the two points than a fleet three times the size could handle.

All of the hauling will be done under contract, and there will be no "less-than-truckload" shipments taken. Further, these full loads must all go to one destination. There will be no intermediate stations for the present, shipments being taken only for Buffalo and New York delivery at first. Officials announce that contracts have been signed to insure full loads for the trucks for the return trip.

The trucks will run in convoy formation, and 10 or 11 hrs. will constitute a day's run. The drivers that start with the trucks will continue with them throughout the trip. The character of the freight to be handled will include everything that moves by a truck of this capacity.

Rates for hauling will be the same as for express, but there will be the added feature that the power that carries the shipment across the country will deliver it at the door of the consignee. Present plans do not include way stations for concentrating freight or for unloading for further distribution. By handling all this business under contract there will be no necessity for interstate commerce regulations.

One feature of the truck will be a pneumatic tire equipment, with the use of which a speed of 25 to 30 m.p.h. is anticipated. Special changes in construction to permit of this speed have been made. In addition to the 2-ton internal gear drive there will be also probably some 3½-ton worm-drive trucks in service. All will have special bodies of the stake type, with tarpaulin covers, the loading capacity being 12 by 6 by 6 feet.

California to Have Tractor Demonstration

DAVIS, CAL., Feb. 13—A tractor demonstration will be held on the University of California Farm, April 17, 18 and 19 under the auspices of the California Tractor and Implement Assn. This association was formed by tractor manufacturers and their representatives for the purpose of conducting such a demonstration.

A special effort will be made to show the broad scope of modern power-farming and the versatility of the modern tractor. There will be a complete showing of tractor tools, including plows, discs and drag harrows, cultivators, sub-soilers, scrapers and checkers.

Practically every make of tractor sold on the Pacific Coast will be shown. These include the Holt, Yuba, Best Tracklayer, Waterloo Boy, Cleveland, Samson, International, Avery, Case, Monarch, Bean, Moline, Wallis, Fageol, and Sandusky. Implement lines will be exhibited by the John Deere Plow Co., Oliver Plow Co., Pacific Implement Co., Baker & Hamilton, I. H. C., Moline Plow, Case, Avery, Holt, and Yuba.

The use of the tractor as a stationary power plant will also be demonstrated, and tests will be conducted as to actual drawbar horsepower and short-turning ability in plowed ground as well as on ordinary surfaces. Tests will be under the direction of Professor Davidson of the University of California.

The demonstration committee in charge of the show is composed of W. H. Gardner, Yuba Co., chairman; W. E. Price, Pacific Implement Co.; W. D. Boswell, distributer, and Prof. J. B. Davidson. Eugene Smith will manage the demonstration.

Washington-New York Truck Line

WASHINGTON, D. C., Feb. 11—The Liggett-Riker-Hegeman Drug tores have inaugurated a truck schedule between New York and Washington to overcome the uncertainties of rail shipments. A 6½-ton Packard is used and it is expected that with clear weather conditions the 300-mile journey can be made in 2½ days.

Detroit-Cleveland Truck Route Ready

DETROIT, Feb. 11—The local traffic department of the Board of Commerce has received a letter from the Highway Motor Transport Co. of Cleveland, asking for 500 tons of Detroit commodities to carry to Cleveland as soon as possible. The company has already 500 tons of Cleveland goods awaiting truck transport to Detroit. It is planned to operate these trucks in trains of from eight to twelve each, each truck being capable of carrying 6½ tons. The rate from Detroit to Cleveland will be $1.35 per hundred, and the trip each way will take not longer than 3 days.

Link Mid-West Cities by Truck

Detroit, Cincinnati, Cleveland, Toledo and Chicago to Be Regularly Served

DETROIT, Feb. 11—Detroit, Cincinnati, Cleveland, Toledo and Chicago will be connected by an inter-city motor truck line within 60 days if plans now under way mature.

A Toledo concern known as the National Motor Transport Co. is planning to put 50 trucks into operation in 2 months, and as soon as these are in successful operation to add 100 more. It is expected that 150 trucks will be on the road in 90 days. F. V. McCormick of Detroit is in Toledo organizing the company. It is stated that 25 men, most of whom are Toledo business men, are interested, and it is expected to incorporate soon for $1,500,000.

The routes between the four cities have been mapped out and test trucks have been sent over the roads that show that fast time can be made. According to tentative schedules, the distance from Toledo to Detroit will be covered in 6 hours; from Toledo to Cleveland in 12 hours; Toledo to Cincinnati in 18 hours; and Toledo to Chicago in 24 hours.

The truck equipment will be decided upon as soon as the board of directors is organized. Traffic Commissioner H. G. Wilson of the Toledo Commerce Club has taken the matter up with the Interstate Commerce Commission and has been assured that charges made by the truck company will not be interfered with, at least until after the war, as the government favors the establishment of such transport companies now to relieve railway congestion. The same assurance has been given by the Ohio Public Utilities Commission. It is planned to run the trucks in trains of five each, and it may be that branch lines will be established along the routes later. All kinds of parcels, express and freight will be carried.

Indianapolis-Chicago Line

INDIANAPOLIS, IND., Feb. 9—Racklind & Farber, produce merchants of Indianapolis and Chicago, have inaugurated a motor freight line between the two cities. The run is 186 miles, and recently a Maxwell truck loaded with 23,000 lb. of perishable freight went through in 18 hours.

Producing 60 Ford Tractors a Day

DEARBORN, MICH., Feb. 11—Henry Ford & Son are completing the order of 7000 tractors for the British Government and are now turning these tractors out at the rate of 60 per day. Six thousand of these tractors are completely assembled, while the other 1000 are made in service parts. Production is still being stepped up, and it is predicted that the output will probably reach seventy-five a day during the coming summer.

To Make Essex at Hudson Plant

Preliminary Work of Getting New Car in Production Now Going On

DETROIT, Feb. 13—The Essex car, which will be produced by a concern headed by W. J. McAnenny, vice-president of the Hudson Motor Car Co., will be manufactured in the Hudson plant. The car was to have been built in the old Studebaker plant No. 5, which was bought for the purpose, but this was leased out for war work. Meantime, the preliminary work of getting the Essex car into production is going forward at the Hudson plant. Nothing definite regarding the entrance of the Essex into the commercial field nor any details of its specifications can be announced at present. Plans for going ahead with the production are being formulated, and extensive tests are being given to the car in its experimental form.

—

AA Trucks Reach Washington

WASHINGTON, Feb. 13—The four sample ¾-ton Quartermaster trucks, Class AA, arrived in Washington last night, making the journey in less than four days from their respective factories. The trips were made without any serious mechanical troubles. The average speed was 18 miles per hour and the gasoline consumption 10 miles per gallon.

—

Dahlquist and Finkenstadt Promoted

WASHINGTON, Feb. 13 — Captain Charles S. Dahlquist, formerly engineer for the Timken-Detroit Axle Co. and now in charge of axle inspection for the Motor Transport Section of the Quartermaster Corps, has been promoted to be a major. Second Lieutenant Rudolph Finkenstadt, formerly assistant to Christian Girl of the Standard Parts Co., Cleveland, now assisting Girl in the Motor Transport Section of the Quartermaster Corps, has been promoted to the rank of captain.

—

Labor Shortage a Myth

WASHINGTON, Feb. 13—In direct contradiction to the cry of labor shortage and the threat of labor conscription, Secretary of Labor William B. Wilson states to-day: "The immediate labor needs of the shipyards are filled and the man who leaves his present position to seek employment in shipyards is likely to find no work. The coming month, however, will necessitate an increase in the present number of shipyard workers by several hundred thousand men who have had experience in trades used in shipbuilding.

"The Department of Labor is now enrolling men of these trades through its United States Public Reserve who are willing to go to shipyards when they are advised. The shipyard volunteers will be placed through the Department of Labor when it has full details as to when and where the men are needed, the wages and housing and other conditions.

"We appeal to all qualified men to enroll during the coming week in the reserve and to stick to their present jobs until they are called."

—

To Cut Ford Car Production 50 Per Cent

DETROIT, Feb. 14—Reports that the Ford Motor Co. will abandon the manufacture of passenger cars are denied by factory officials. The Ford plant will be largely devoted to war work on airplane and submarine destroyer parts, with the result that passenger car production will be cut about 50 per cent. At present, the normal output of the factory is about 3000 cars daily. A reduction of 50 per cent would bring this to 1500 cars a day.

The Ford company is behind with its orders in practically every section of the country, and the resulting cut in production will naturally cause a country-wide shortage of Ford cars, as soon as available supplies in branch plants are used up. Ford dealers have been urging prospects to place orders early in order to take care of the demand.

—

American Machinery Plant for Shells

DETROIT, Feb. 14—The American Machines Corp., Port Huron, Mich., a munitions manufacturing company subsidiary to the American Canadian Resources Co., has purchased the American Machinery plant. Men have already been put to work on a $500,000 government contract for the manufacture of shells.

The American Machines Corp. is controlled entirely by outside capital, and the machinery and plant were purchased outright. The plant of the American Machinery Co. is fully equipped for the manufacture of shells as it was recently engaged in making shells for the Russian government. It is expected that 300 men will be employed and the factory run on a 24-hr. basis in a short time.

—

65,000 Hercules Engines for Allies

CANTON, OHIO, Feb. 13—The Hercules Motor Mfg. Co. has started work on a contract placed by Henry Ford & Son, Dearborn, Mich., for 65,000 farm tractor engines for use in the allied countries. Additional workmen are being employed, and full capacity and facilities utilized for this work. Extensive repairs are being made in the plant to speed up production, and it is expected that more than 100 engines will be produced daily. These will be shipped to Cork, Ireland, where Henry Ford & Son have an assembly plant.

—

$500,000 to Transport Labor

WASHINGTON, D. C., Feb. 12—The Department of Labor has asked Congress for $500,000 to be used for transporting workers about the country. An appropriation for $50,000,000 for housing and transportation will be asked in the near future.

Stettinius to Push War Work

Purchases Surveyor Will Maintain Even Flow of Production—Pierce for Priorities

WASHINGTON, Feb. 12—In making plain the exact functions of Edward R. Stettinius of New York, who has recently been appointed Surveyor of Purchases and Supplies, the War Department has indicated that Stettinius is "associated with and subordinate to Brig.-Gen. Palmer E. Pierce," who will have supervisory charge of all purchases made by the several purchasing bureaus of the War Department.

The function of Mr. Stettinius will be largely that of surveyor of the industrial field and an accelerator of war supplies. In other words, he will be largely instrumental in maintaining an even flow of production to the purchasing agencies of the War Department. He is to keep track of the capacity and production of contractors and will pass along orders for changes in the requirements of the American expeditionary forces to harmonize production with demand. General Pierce will determine priorities and make estimates of requirements, but will not take over the routine purchasing activities of the various bureaus which will be continued as heretofore.

Quartermaster General George W. Goethals has been given additional duties. He will act also as director of storage and traffic as well as quartermaster general. Among other things he will direct priorities of storage and war traffic in the United States, the embarkation of supplies and troops, inland war transportation and storage at inland points, embarkation points and overseas points.

—

All Aviation Training in U. S. Now

WASHINGTON, D. C., Feb. 12—The demands of France for American soldiers to be given advance training in the French aviation schools have been met and all advance training in France is now filled up. Hence all of the American soldiers enlisted in the flying service are being given their advance training in this country.

It is considered likely, however, that France will ask for more men to train as soon as the several thousand now undergoing flying instruction in France have completed their courses. At this time we will again send aspirants for aviation service abroad for their advance training.

—

Heatless Mondays Abolished

WASHINGTON, Feb. 12—Fuel Administrator Dr. Harry Garfield has formally abolished heatless Mondays. He has stipulated, however, that certain State fuel administrators have discretion to take steps similar to the heatless order when deemed imperative.

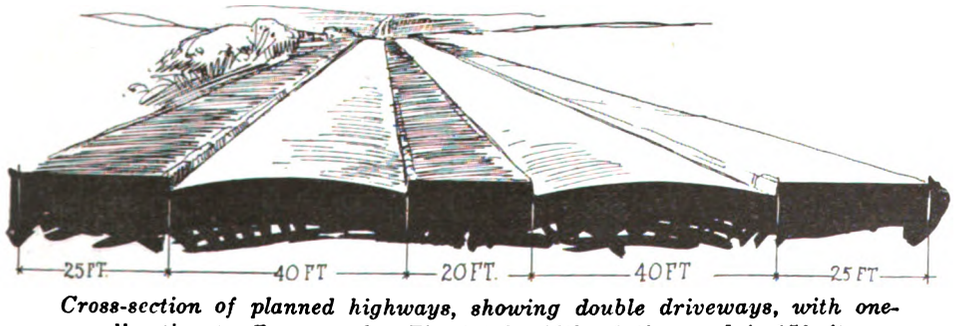
HighwayTrunkLines for England

To Be Built on Straight-Line Principle and Pass Large Towns at Easy Distance

LONDON, Jan. 9—England is already seriously considering the development of a line of motor highways laid out largely on the principle of trunk railroad lines, which would be used exclusively for motor transportation, and built with the object of opening up cheap land transportation and connecting the large market centers.

This new system of roads, according to plans, would be built on the straight line principle and would not enter large towns, but rather pass them at easy distances. The roads would be as straight as possible, 150 ft. wide, with double driveways, and only one direction traffic on each. It is not the purpose of these roads to increase in size the already large towns, but to provide good transport facilities through the country. They will also reduce the congestion of large towns by providing cheap lands on which trades which cannot be profitably carried on in town may be developed. Factories would spring up alongside these roads just as they have followed railroads and waterways in the past. Opportunities for town and city planning would be provided, and also cheap land for homes in connection with those industries developed.

According to plans, England's highway system will run directly from Portsmouth to the northern manufacturing area. No attempt is made to have the road pass through the large towns



Factories Served by Motor Vehicles

Factories and buildings in connection with these new roads would rely entirely on motor vehicles for transportation, and delivery of merchandise to the retailer, the consumer or the ports for export trade. Trans-shipment would thus be eliminated and congestion of railroads greatly reduced.

No definite scheme for the entire country has been worked out, but undoubtedly there would be one main road from London to the great southern export port of Southampton. There would be a road leading north from London to Manchester and Liverpool, and others to the northern manufacturing cities such as Leeds, Bradford and York.

That such a system of roads would be of great military value has been proven by the value of those in France. These new roads would be laid out without regard for existing highways, but an existing highway, coinciding with the planned road, would be incorporated into the scheme.

A road system of this nature would thread all of the great manufacturing and producing districts. The building of such a highway system would follow as one of the after-war developments of the country, and the work of construction would absorb practically all the surplus labor of the nation.

Cross-section of planned highways, showing double driveways, with one-direction traffic on each. The total width of the road is 150 *ft.*

—

England Restricts Tractor Importation

LONDON, Jan. 9—On account of increasing freight difficulties, the importation of farm tractors is being materially reduced, and it is understood that no permits will be given for the importation of tractors excepting where the individual importer can show that he has already sold a reasonable percentage of the number he wants to import. Heretofore the importation of tractors has been encouraged and the present action indicates that the government plans to restrict tractor importation as carefully as that of motor trucks.

—

December Oil Output Slightly Decreased

WASHINGTON, Feb. 11—The December output of oil was 19,807,143 barrels, as compared with 20,492,712 in November. The decrease is due to the lessened output of the oil fields north and east of Oklahoma, where the weather was coldest. In all other fields the output showed a fair increase.

The reserve oil stocks were requisitioned in December in all fields except the Appalachian and Rocky Mountain districts, where moderate additions to stocks were made. Except in the Oklahoma-Kansas field, the surface reserve of crude oil at the end of 1917 was appreciably less than at the end of 1916.

—

477 St. Louis Automobile Men in Service

ST. LOUIS, Feb. 11—A canvass of the motor trade here shows that 477 men have gone from the industry into military and naval service. The Dorris Motor Car Co. alone sent 158 men, many of them enlisting as repair men and drivers. Othere figures are: Ford Motor Co. (St. Louis branch), 53; Chevrolet Co., 25; Overland Co., 18; Hudson-Phillips and Cadillac companies, 15 each.

United States Rubber to Change Laws

Amendments Approved by Board of Directors to Be Submitted to Stockholders Mar. 19

NEW YORK, Feb. 11—The United States Rubber Co. will submit several amendments to the by-laws for consideration of the stockholders at the annual meeting on March 19. These have already been approved by the directors.

First, it is proposed to change the date of the annual meeting from the third Tuesday in March to the corresponding day in April, and the hour from 12:30 to 11:30 a.m. The second amendment, if adopted, will increase the number of directors from 21 to 25. The third provides for the optional election of a chairman and vice-chairman of the board of directors and a controller of the company. These offices do not exist at present, and it is understood that even if the amendment is adopted, they will not be filled in the near future. This amendment also provides that the vice-presidents need not be directors.

The chairman of the board of directors will have greater powers, according to the fourth amendment. He will be the chief executive officer of the company, subject to the board, and shall be in general charge of the affairs of the company. He will preside at all meetings of the stockholders and board, and be chairman of the executive committee. The directors, at their discretion, may elect a vice-chairman, who is to perform those duties prescribed by the executive committee, the directors or the chairman of the board.

If a chairman is not elected, the president, subject to the directors, the executive committee and the chairman of the board, will have general charge of the business of the company relating to purchasing, selling and general operation.

The seventh amendment provides that the treasurer, jointly with the president or one of the vice-presidents, shall have custody of the securities belonging to the company. The controller is to be the principal officer in charge of accounts.

Proxies for the annual meeting on March 19 are being asked for in the names of Samuel P. Colt, James B. Ford, Lester Leland, Walter S. Ballou, Nicholas F. Brady and Charles B. Segar, who comprise the executive committee.

—

Maxwell Truck Ends Endurance Run

NEW YORK, Feb. 11—The Maxwell truck which left New York Dec. 1 on an endurance and demonstration run has reached its destination at Washington after covering 2488 miles by way of Philadelphia, Washington, Richmond, Atlanta, Ga., to Jacksonville, Fla., and return through Savannah, Augusta, Columbia, S. C., Raleigh and Richmond. The run was made entirely under the supervision of the American Automobile Association, James A. Hemstreet being official observer, and the official sanction, No. 1080. The average gasoline consumption was 10.56 miles to the gallon though in places this was as high as 15.1 m.p.g. The average consumption of oil was 2.0497 qts. per 100 miles and of water 1.334 pts. per 100 miles. During the entire run the weather was unfavorable, the temperature ranging from 30 deg. above to 12 below zero, Fahr. The total load transported was 2039 lbs., and during the run no adjustments except minor ones on carbureter and gasoline feed line were made. One coil radiator spring and one fan belt were replaced. The vehicle was a stock Maxwell 1-ton truck.

—

National Price Increases

INDIANAPOLIS, Feb. 11—The National Motor Car & Vehicle Corp. has increased the prices of all 6 and 12-cylinder models, excepting the convertible sedan. The new prices go into effect immediately, in accordance with the prediction made at the New York and Chicago shows.

Prices follow:

Model	New Price	Old Price	Increase
6-cyl.			
7-pass. touring	$2,150	$1,995	$155
4-pass. roadster	2,150	1,995	155
4-pass. phaeton	2,150	1,995	155
Sedan	2,820	2,820	...
12-cyl.			
7-pass. touring	$2,750	$2,595	$155
4-pass. roadster	2,750	2,595	155
4-pass. phaeton	2,750	2,595	155
2-pass. dispatch roadster	2,850	2,750	100
Sedan	3,420	3,420	...

Automobiles Relieve St. Louis Car Strike

ST. LOUIS, Feb. 11—A street car strike lasting from Sunday, Feb. 3 to Thursday, Feb. 7, emphasized the thoroughness of the motorization of the city. More than 60 per cent of the workers got to their places of business in automobiles. The immediate lifting of all fuel and light restrictions on garages and repairshops was one of the beneficial results of the strike.

Local dealers and accessory stores had the busiest week on record, and passenger cars and trucks, of every description were brought into use.

—

Chandler 1917 Output 15,000 Cars

CLEVELAND, Feb. 11—The Chandler Motor Car Co. manufactured 15,000 cars in 1917, and showed, before deduction of Federal taxes, net earnings of about 34 per cent on the $7,000,000 outstanding stock. War taxes amounted to $7 or $8 a share, and after allowing for these, the company earned its $12 dividend rate more than twice over.

The foreign trade of the company included almost every country in the world outside the fighting nations of Europe, and those where embargoes exist. This foreign business, carried on in spite of high freight rates, is taken as an indication of the demand that will exist after the war.

Plan Uniform U. S. Registration

Secretaries of State Draft Law Making Operators' Licenses Necessary in All States

TOPEKA, KAN., Feb. 11—The Association of American Secretaries of State is the sponsor for a uniform registration measure, which will apply to all states. At the second annual meeting of the association held last fall a committee was appointed to draft a law, and this has now been done. It will be submitted to all secretaries of state, and if approved will be introduced into the legislature of every state in the union. The measure provides the usual registration of a car and makes compulsory the obtaining of a license to operate a car. It also requires manufacturers and dealers to make monthly reports of all cars sold. The measure is intended primarily to discourage the theft of cars and would require secretaries of states to maintain card indexes giving the engine number and other identifying marks on cars. Persons who destroy identifying marks are to be deemed guilty of a felony, and any dealer who sells a car with a defaced or destroyed engine mark shall be deemed guilty of a misdemeanor which is punishable by a $500 fine. The measure also provides for headlamps with "dispersive lenses or glass mechanism or apparatus or otherwise so regulated as not to blind or dazzle other users of the highway or make it difficult or dangerous for other users to ride, drive or walk thereon."

—

Automobile Industry Uses Little Coal

WASHINGTON, Feb. 11—Although the automobile industry is one of the largest in magnitude, it uses a very small amount of coal. The last figures available are those compiled by the U. S. Bureau of Census for 1914, and these show that 41 other industries consumed more coal. Less than 500,000 tons were used in automobile and motor truck plants, while 31 other industries used more than 1,000,000 tons each.

—

CLEVELAND, Feb. 11—Frank Willis, president of the Hal Motor Car Co., denies the rumor that he has resigned. He said that a meeting was held recently, at which there was a discussion as to whether the company should liquidate. No final decision was reached, although it seems probable that liquidation will occur.

—

Jordan Ships 1727 Cars

CLEVELAND, Feb. 11—The Jordan Motor Car Co. manufactured and shipped 1727 cars during 1917, the total volume of business amounting to $3,000,000. More cars were sold in the last three months than any other quarter of the year.

Michigan Manufacturers Fall Back on Drive-Aways

Characterize Freight Situation as Impossible

DETROIT, Feb. 14—Manufacturers here, and in Toledo, Flint, Jackson and other centers characterize the freight situation as impossible. It is almost useless to try to move cars by freight, and manufacturers have had to fall back entirely upon drive-aways. The only drive-away gate that is open runs through Toledo, as roads to Grand Rapids and the West are still impassable.

Rains have held up the Buick drive-aways, so that they are down to 25 or 30 a day, but the company has been able to ship about 200 cars daily by freight.

The road situation is temporary, and no doubt drive-aways will be back in full swing in a day or so. The Buick output runs from 300 to 350 cars a day, so that unless drive-away conditions are improved, the output will exceed delivery. Oldsmobile drove 40 cars through to Toledo on Saturday, 40 Sunday and 40 Monday.

—

Motor Transport Gets New Office

WASHINGTON, D. C., Feb. 11—The Motor Transport Section of the Quartermaster Corps is now located at Sixth and E Streets, 1421 I Street, Union Depot Office Building and the Treasury Building. Gen. Chauncey B. Baker, who heads the Motor Transportation Division, has moved with his staff, including Col. Edward Drake and Col. James Furlow, from the State War and Navy Building to the Georgetown University Building at Sixth and E Streets. This move follows the relieving of General Baker as chief of embarkation. Christian Girl as chairman of the Motor Transport section continues his office at 1421 I Street, although it is anticipated that these will be moved shortly to a temporary Government building. The draftsmen of this section are housed in the Treasury Building, and the engineering is handled in the office building of the Union Depot.

—

3 Companies to Make Nash Trucks

CHICAGO, Feb. 13—Arrangements have been made whereby the Nash Quad 4-wheel drive and steer trucks are to be manufactured for the Government by the National Car & Vehicle Corp., Indianapolis, the Paige-Detroit Motor Car Co., and the Hudson Motor Car Co., Detroit, under the Nash Motors Co. patents. It is understood that these are for the Ordnance Department, and are to be produced in large numbers. The tooling and equipment of the three factories to manufacture these is going forward and production will start as soon as possible.

—

Form Kalamazoo Munitions Co.

KALAMAZOO, Feb. 14—A munitions corporation is being formed here by industrial men in line with organizations formed in other industrial centers, such as the Detroit Shell Co. The corporation will have a capital of at least $100,000, 10 per cent of which will be paid in. The business will be controlled by a board of directors of seven disinterested business men. There will also be a technical board of seven engineers acting in an advisory capacity on estimates, bids, distribution and completion of contracts.

Through centralized efforts, Jackson has already received war contracts amounting to $8,000,000 and the plan has also worked out to advantage in Grand Rapids, Cadillac, St. Johns and other cities.

—

Washington Office for Highway Industries Association

WASHINGTON, D. C., Feb. 11—The Highway Industries Association, recently formed in Chicago, will hold a directors' meeting in Washington Feb. 16 to arrange for location of an office here and complete its organization. S. N. Williams, sales manager for the Garfield Motor Truck Co., chairman of the association, is already in Washington arranging for future activities. It is expected that the National Automobile Chamber of Commerce and the Motor and Accessories Manufacturers' Association will name directors for the new association this week, including one to represent the accessories makers, another to represent the motor car makers and a third the motor truck makers.

—

Retire $4,000,000 Curtiss Notes

BUFFALO, Feb. 12—It is understood that the convertible 6 per cent notes of the Curtiss Aeroplane & Motor Corp. will be called soon at 102½. There are two issues of $2,000,000 each. Retirement of the notes means that a possible increase in stock amounting to 80,000 shares will not be made.

—

License Rubber Exports

WASHINGTON, D. C., Feb. 11—The War Trade Board has issued a conservation list of materials which may not be exported to any country except under license and the list contains rubber and all commodities containing rubber. The War Trade Board will regulate the export of rubber tires by this form of license.

—

Claim Against Hal Motor

CLEVELAND, Feb. 13—A petition asking that the Hal Motor Car Co. be adjudged an involuntary bankrupt was filed in the Federal Court here yesterday by the Universal Machinery Co., the Keyless Auto Clock Co. and the C. H. Hanson Co. The petitioners presented claims aggregating only $1,500.

—

Chicago Pneumatic Earns $2,000,000

DETROIT, Feb. 14—The Chicago Pneumatic Tool Co. shows net earnings of $2,000,000 for 1917. This is an increase of 30 per cent over 1916 and amounts to $18 a share on the company's stock of $7,500,000, of which $6,485,800 is outstanding. The profits were calculated after deducting income and excess profits taxes.

Pennsylvania Crude Oil Advances 25 Cents a Barrel

Sets New High Price and Low Production Records

PITTSBURGH, Feb. 11—The price of Pennsylvania crude oil has been advanced an additional 25 cents a barrel, the present price being $4. This is a new high record.

All other grades have been marked up 5 cents a barrel, as follows: Corning to $2.85; Cabell to $2.77; Ragland to $1.25; and Somerset to $2.60.

The advance in the price of crude oil at this time is construed by oil men as government recognition of the necessity of higher prices. For some time the production in Pennsylvania has been decreasing, and the pipe line in the Pennsylvania, Kentucky and Mid-Continent fields during the last two months have set a new low record for the last 10 years.

For some time there has been an agitation for higher prices among producers, but these demands were refused by the big interests, particularly the Standard Oil Co., because of the critical situation in the oil industry.

On the strength of the Pennsylvania increase, 10 per cent premiums were posted on Ohio, Indiana and Illinois products, establishing North and South Lima at $2.18, Wooster at $2.48 and Princeton and Illinois at $2.22.

—

Packard Truck Prices Higher

DETROIT, Feb. 13—The factory prices of Packard trucks will be increased on March 1. The prices follow:

Model	New Price	Old Price	Increase
1-ton	$2650	$2450	$200
1½-ton	3000	2800	200
2-ton	3400	3200	200
3-ton	4100	3900	200
4-ton	4450	4375	75
5-ton	5150	4900	250
6-ton	5400	5150	250

—

Supervise Liberty Engine Testing

DETROIT, Feb. 11—D. McCall White, vice-president and chief engineer of the Cadillac Motor Car Co.; H. M. Crane of the Wright-Martin Aircraft Corp.; John Wilkinson, vice-president and consulting engineer of the H. H. Franklin Mfg. Co., have been appointed a committee of three to supervise all testing work on the Liberty airplane engine. The duties of this committee are wide in scope, and they will pass final judgment on the engine, making their reports and recommendations direct to Howard Coffin, chairman of the aircraft board.

—

Ajax Earns $1,955,293

TRENTON, Feb. 12—The Ajax Rubber Co. increased its sales during 1917 by 63½ per cent over 1916 and earned profits of $1,955,293; from this Federal war excess profit and income taxes are to be deducted and amount to about $495,000. The balance sheet as of Dec. 31 shows assets of $11,920,449; the profit and loss account shows sales of $13,828,282.

Washington News Letter

(Continued from page 379)

be considered and chosen for this position owing to Girl's exceptional capabilities and experience. His handling of the Class A, Class B and Class AA trucks has successfully demonstrated his ability to efficiently assume the duties of the prospective position co-ordinating the truck work of the army.

It is also likely that Gen. Chauncey B. Baker, who is head of the motor transport division of the Quartermaster Corps, has successfully displayed his ability will be the military chief to handle all motor truck requirements.

The fuel committee appointed a few weeks ago to hold further conference with the Fuel Administration regarding coal allowance for the industry has not yet called a meeting, and rumor has it that the Fuel Administration is becoming impatient and will not brook much delay. It was reported last week in Washington that one of the largest motor car makers made a flying trip to Washington and satisfactorily arranged the coal allowance for his own ompany.

Reports of Dissension

Reports of dissension between individuals of the automotive industries in Washington are frequent. The latest include difficulties arising between several truck makers submitting bids in the Ordnance Department which included approval of one make of truck in one office with blue penciling of the order in another with consequent wrangling between both companies and individuals until the order was finally placed for decision before Gen. Pierce, chief of purchases for the entire army.

There has been frequent discussion in Washington of the trouble caused by some companies which are taking every contract they can secure, regardless of what consequences may be, instead of confining their activities to a specific line. Reference has been made to several companies which are making everything from anchors to trucks. It is thought that the diversified activities reduce the efficiency of the companies so engaged.

Rubber Exports Licensed

The order of the War Trade Board prohibiting the export of commodities containing rubber except under license may have an important effect on the tire industry. At this writing it is impossible to ascertain how much, if any, limitation will be placed on the export of automobile tires.

The Presidential proclamation regulating import and export for the conservation of ship tonnage has not up to this time been approved and is still pending.

The War Credits Board, created to pass upon advances of funds to contractors engaged on war work, has approved advances of one hundred and fifty million dollars. This has stimulated the production of war material greatly. Both large and small contractors have availed themselves of the system. The law permits advances not exceeding 30 per cent of the contract price for supplies.

When a concern holding a war department contract displays to the board its financial needs and complies with the act by giving adequate security, the advance is approved and the money given without delay—in some instances the same day the application is filed. Many manufacturers on account of delays caused by railroad congestion, etc., used up their own capital, borrowed all they could from banks and still did not have the necessary requirements to complete the contracts.

Offer Financial Help

In some instances they were on the verge of closing down because of inability to meet payrolls. Many such companies as these have been relieved by the advance payments. The board will be of a particularly great value to the manufacturer of limited working capital.

Secretary McAdoo's "War Finance Corporation Bill" to provide credits for industries and enterprises in the country necessary or contributory to the war and for the licensing of "non-essential" industries met with a halt in the Senate this week when Senator Lodge asked Secretary McAdoo for an explanation of the so-called non-essential industries Secretary McAdoo has promised to take this up this week. His plan of licensing non-essentials is designed chiefly to prevent diversion of capital and labor to these industries.

War Department Reorganized

The Secretary of War has announced an entirely new schedule of operation for the war department designed to eliminate red tape and facilitate army activities. Under the new scheme there will be an executive division, war plans division, purchase and supply division, storage and traffic division and army operation division.

The purchase and supply division will be under a director of purchase and supplies and his duties will include direction of all purchases, procurement and production for the entire army, representation of U. S. army with the Allies, determination of purchasing and manufacturing priorities between the several departments within the war department and in relation to other U. S. Government agencies and also determination of preference to contractors for supplies in case of shortage of fuel or raw materials, supervision of all appropriations and other financial matters relating to purchase of munitions.

The storage and traffic division will control the transportation of all branches of the army, munitions and other supplies of land and sea under a director of storage and traffic. His duties will include all movement of troops, provisions, all supplies during manufacture and after assembling to points of embarkation, interior points, overseas points and in and out of all storage, all inland traffic, including employment of army trucks and all storage of munition.

—

Pearce Rubber in Temporary Difficulty

PHILADELPHIA, Feb. 13—Henry C. Thompson, Jr., has been appointed temporary receiver for the Pearce Rubber Co. The action was taken because of difficulties which can be straightened out in a few months. Machinery ordered by the company for its new quarters did not arrive, and this, in conjunction with a coal shortage, necessitated the shut-down of the plant. There are plenty of orders on hand, which will be filled as soon as the company can operate again. The concern is solvent, and its assets exceed its liabilities.

—

Lincoln Completes First Liberty Engine

DETROIT, Feb. 11—The Lincoln Motors Co. has completed its first Liberty engine. This concern has built and equipped its plant in record time, having been incorporated in August, 1917, by Henry M. Leland and Wilfred C. Leland, who resigned as president and general manager of the Cadillac Motor Car Co. to engage in airplane manufacture for the Government in the plant formerly occupied by the Rands Mfg. Co. Since this time additional land and buildings have been acquired.

—

Government Position for Tripp

WASHINGTON, D. C., Feb. 11—Guy E. Tripp, heretofore chairman of the board of directors of the Westinghouse Electric & Mfg. Co., has been appointed head of the production division of the Ordnance Department with the rank of colonel. He will work directly under Secretary Baker.

—

Automotive Show Draws 178,270

(Continued from page 378)

gineers' dinner of the Minneapolis section, on Wednesday evening, when over 150 attended. The dinner was followed by a discussion on tractor fuels, which turned into a discussion on the merits of hot spot manifolds for burning kerosene in tractors. Already Minneapolis and Kansas City have been added to the winter circuit of S. A. E. meetings. The tractor makers in the Twin Cities are sure to make a big success of the Minneapolis section, which is the baby section of the S. A. E.

Dealers' meetings during the week were better attended than in former years, and while the number of dinners was not great, those held were good ones. Generally, several factory representatives were present and good talks on general conditions were given. No better opportunity could have been desired to get the dealers into the true war spirit than during show week.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

General Motors Plants Co-operate for War Work

SAGINAW, MICH., Feb. 11—The Michigan plants of the General Motors concerns are co-operating in the manufacture of war materials, and the Peninsula Shell Co. will be used as an assembling plant in this connection. The parts for assembly will be supplied by other branches of the General Motors Co. The Saginaw Malleable Iron Co. will make all the malleable iron castings to be used, and is now installing equipment for this purpose.

—

Mutual Motors Buildings Bring $212,000

JACKSON, MICH., Feb. 11—The purchase of the Mutual Motors buildings by the Susquehanna Finance Corp., of Buffalo, N. Y., winds up the affairs of the company which made the Marion-Handley, Marion and Imperial automobiles. The sum of $212,000 paid for the plant will enable the referees in bankruptcy to pay about 30 cents on the dollar on outstanding obligations.

—

Roddis Veneer Ordered by France

MARSHFIELD, WIS., Feb. 11—The Roddis Lumber & Veneer Co. has received from the French government a contract calling for veneer for airplane parts. The company is filling contracts for various kinds of wood material for the United States government.

—

Oneida Truck Moves to New Factory

GREEN BAY, WIS., Feb. 11—The Oneida Motor Truck Co., Green Bay, has completed the transfer of the machinery, equipment and stock from the temporary quarters it has been occupying during the past year into its new and modern works at the southwestern limits of Green Bay, and the capacity is being increased to 100 Oneida trucks per month. The new factory is 150 x 476 ft. in size, affording 70,000 sq. ft. of floorspace, and is of fireproof construction, one story high, all departments being under one roof. A Pacific coast branch is being opened in San Francisco. Eastern trade is being handled through a New York branch established some time ago.

—

Heil Steel Bodies for Government

MILWAUKEE, Feb. 11—The Heil Co., manufacturer of electrically welded steel dump bodies for motor trucks, has received a second Government contract for a special design of dump body for use on truck chassis used in road building and bridge construction. The company recently completed a large addition to its plant, to be used exclusively for this work.

—

Bliss Mfg. Co. Adds Equipment

MILWAUKEE, Feb. 11—The Bliss Bros. Mfg. Co., 208 Manufacturers' Home Building, which established a plant about a year ago to produce tools and dies, is adding equipment and machinery to occupy all of the available area of the present quarters to meet its orders.

United States Trucks for Philadelphia Contractors

CINCINNATI, Feb. 11—The United States Motor Truck Co. has obtained an order for a fleet of 5-ton heavy duty trucks from the Keystone Construction Co., Philadelphia. The contract amounts to $30,000,000.

—

Barnhill, Inc., Elects New Officers

NEW YORK, Feb. 10—J. D. Barnhill, Inc., 110 East 34th Street, has elected the following officers: Philip S. Dodd, president; Clayton DuBosque, vice-president and treasurer, and William T. Andrews, secretary and art director.

—

DIVIDENDS DECLARED

The Studebaker Corp. has declared a quarterly dividend of 1 per cent on common stock and 1¾ per cent on preferred, payable March 31.

The Jones Motor Car Co., Wichita, Kan., has declared an initial 10 per cent stock dividend, payable to holders of record Jan. 10.

The American Radiator Co., Detroit, has declared the regular quarterly dividend of $3 and an extra dividend of $4 a share on common payable in Second Liberty Loan bonds. The regular quarterly dividend of 1¾ per cent on preferred stock was also declared.

—

Autocar Chassis Price Raised

ARDMORE, PA., Feb. 10—The Autocar Co. has increased the price of the Autocar chassis from $1,815 to $2,050. Orders placed prior to Feb. 6 will be accepted at the old price.

Men of the Industry

Changes in Personnel and Position

Toback Elected President of Redden Motor Truck Co.

CHICAGO, Feb. 10—Samuel S. Toback, who quite recently was appointed general manager of the Redden Motor Truck Co., has been elected to the presidency of the company.

—

A. E. Vinton has been made advertising manager of the National Motor Car & Vehicle Corp., Indianapolis. For more than 8 years, Vinton has been in the sales department, in charge of the company's export trade, and in 1910, when National cars were well-known among racing cars, served in his present capacity of advertising director. He will retain his position as export sales manager.

—

C. E. Pioch has been appointed chief engineer of the Fruehauf Trailer Co., Detroit. He was formerly connected with the Packard Motor Car Co.

—

H. F. Harris has been made industrial engineer of the Republic Motor Truck Co., Alma, Mich. He was formerly assistant branch manager and controller of the New York branch of the Willys-Overland Co.

—

A. W. Russel, president of the Russel Motor Axle Co., has become an assistant secretary of war at Washington with the huge salary of $1 per annum.

—

A. T. Van Scoy, assistant secretary of the International Harvester Corp. of America, in charge of the company's Milwaukee office, has been elected president of the Milwaukee Assn. of Commerce. This is a reorganization of the Merchants' and Manufacturers' Assn.

—

C. W. Owston, formerly purchasing agent of the McCord Mfg. Co., Detroit, has been commissioned a captain in the Ordnance Officers' Reserve Corps. He will have charge of the Detroit district production office for the carriage section.

—

E. C. Grant has been promoted to the position of purchasing agent of the McCord Mfg. Co., Detroit.

—

Earl R. Martin has been appointed employment manager of the Templar Motors Corp., Cleveland. Formerly he held a similar position with the Curtiss Aeroplane & Motors Corp., the Rubay Co. and the Aluminum Castings Co.

—

F. D. Palmer has been appointed used car manager for the Reo Motor Car Co. of New York. He was formerly connected with the New York branch of the Studebaker Corp.

—

Y. E. Stewart has been appointed sales manager of the Economy Motor Co., Tiffin, Ohio. Mr. Stewart has been connected with Cleveland manufacturers heretofore.

—

Frank C. Kip, formerly sales promotion manager of the Packard Motor Car Co., has returned to his previous position as sales manager of the Motor List Co., Des Moines. He will make his headquarters in Detroit.

—

H. W. Biddle and **C. L. Ughetti** have become associated with the sales department of the Silvex Co., South Bethlehem, Pa. Biddle was formerly supervisor of sales with the Champion Spark Plug Co., and Ughetti in charge of the Indiana and Michigan territories of the same concern.

—

INCREASES OF CAPITAL

CADILLAC, MICH., Feb. 11—The Acme Motor Truck Co., formerly styled Cadillac Auto Truck Co., has increased its capital stock to $1,000,000. The company is building a large addition to its plant, and plans to double its output in 1918.

—

INDIANAPOLIS, Feb. 11—The Weidely Motors Co. has increased its preferred stock from $100,000 to $500,000 to provide for enlargement of its plant and purchase of new equipment. The company recently increased its contract with the Cleveland Tractor Co. for airplane and tractor motors from $3,000,000 to $20,000,000. This covers a period of 3 years, and calls for 15,000 engines the first year, 25,000 the second and 30,000 the third.

—

AKRON, OHIO, Feb. 11—The Falls Rubber Co. has increased its capital from $500,000 to $1,000,000.

—

PORT WASHINGTON, WIS., Feb. 11—The Turner Mfg. Co., maker of engines and tractors, has increased its capital from $150,000 to $250,000. Much of the increase will be used for the expansion of the tractor department. An output of from 400 to 500 tractors is planned for 1918 without any reduction of the usual output of gas engines.

—

GREEN BAY, WIS., Feb. 11—The Oneida Motor Truck Co. has increased its capital from $300,000 to $500,000, to provide for increased production. An output of 1200 trucks has been planned for 1918. The company was organized last March.

—

COLUMBUS, OHIO, Feb. 13—The Columbus Varnish Co. has increased its capital to $400,000.

—

CHICAGO, Feb. 13—The Vulcanized Products Co. is now capitalized at $1,000,000, and in future will be styled Curtis Tire & Rubber Co.

New Companies Formed

Latest additions to ranks of Automotive Industries

Noble Trucks to Be Made by New Indiana Company

KENDALVILLE, IND., Feb. 11—The Noble Motor Truck Corp. has been organized with a capital of $1,000,000 to take over the business of the Noble Motor Truck Co., a $30,000 concern formed last February. The Noble truck, which was designed and manufactured by the original company, will now be placed on the market. Plans are under way to enlarge the present output, and to erect a new factory building. The following officers have been elected: President, C. J. Munton; vice-president, J. L. Hauff; secretary, G. M. Patterson; treasurer, H. W. Bradtmiller. The directors include A. M. Jacobs, H. L. Postel, C. J. Munton, G. D. McLeod, J. L. Hauff, G. M. Patterson and W. G. Roberts.

—

TOLEDO, Feb. 11—The Pronovost Wheel Co., a new corporation with a capital of $350,000, has purchased a 60-acre site for a factory. Until this is finished the company will manufacture an automobile wheel, which by means of torsion springs does away with the need for pneumatic tires, at the plant of the Central Machine & Tool Co. Dies have been completed, and quantity production will soon begin. The wheel was invented by Joseph Pronovost, who is president of the company.

—

NEW YORK, Feb. 9—The Commercial Motorbody Corp., organized to systematize the distribution of commercial bodies used by the motor trade, has leased the buildings that were to be occupied by the Essex Motor Corp., as the first unit of its warehouse system. The corporation will carry a large stock of bodies of all kinds to facilitate rapid delivery to commercial car distributers. Owing to the freight congestion, a warehouse system is greatly needed. The Detroit building covers 90,000 sq. ft. of floor space. Warehouse sites in Chicago and New York are now being considered and will be added before April 1.

—

Cygnet Rear Car Reorganized

BUFFALO, Feb. 11—The Cygnet Mfg. Co. has been formed to take over the business of the Cygnet Rear Car Co., which manufactures motorcycles with rear car attachments used for delivery purposes. The business also includes the production of similar vehicles intended for the transport of munitions and for other military purposes. The capital stock of the company is $600,000 and the principals are Otto L., L. J. and E. A. Heintz.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Iron and Steel Industries Recover Slowly

Milder weather and a somewhat freer movement of traffic have given a more cheerful tone to iron and steel market reports, but the derangement of the whole machinery of production and shipment was so complete that many days will be required, even with no return of severe winter, for any approach to normal. It is to be remembered that excepting October and November, each month since April of last year has shown a decline in iron and steel output, so that the causes go deeper than the weather.

Steel works operations in the Central West are generally at 60 to 70 per cent of capacity and some steel plants, owing to freight embargoes and the large accumulation of unshipped product, are today doing little better than 50 per cent.

The industry continues to look to Washington for its impulse toward better or worse conditions. Its latest concern is the sharper restriction put upon exports, the War Industries Board having warned producers not to begin rolling such steel until export licenses covering it have been issued by the War Trade Board. Blast furnace, steel works and rolling mill products, the trade is now advised, are on the conservation list and all shipments are subject to the new restriction unless bills of lading had actually issued previous to Feb. 11.

This tightening of export regulations following recent efforts to make Government prices apply to certain iron and steel exports, even though not intended for war purposes, is disconcerting to those that have thrived on foreign trade.

Steel manufacturers are still much at sea as to the amount of steel they can supply apart from war uses, and the new business going on their books is small. It is plain that even in plates a considerable amount will be available for ordinary commercial purposes whenever capacity output can be reached. Both plate mills and fabricating shops have had their operations badly upset by the unreadiness of certain shipyards to take material as scheduled.

It will be some time before a new distribution is made of shell steel, deliveries on the 1,500,000 tons now under contract running to June 15. Meanwhile the British Mission is inquiring for 120,000 tons of plates, but modification of some of the unusual widths and lengths, 46-ft. lengths in many cases, will need to be made, in the same way that was necessary with our own Government's first orders, to insure early rolling.

The Government has divided among eight car builders the 4500 cars long under consideration for France, but the new car program for domestic roads drags unaccountably.

A New Service

Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

A new ruling of the railroads that special permits for the movement of freight will be granted only on the application of the consignee, indicating need of the material and ability to unload promptly, is expected to help in reducing congestion.—*Iron Age.*

—

Maxwell Dividend in Scrip

NEW YORK, Feb. 14—The Maxwell Motor Co., Inc., has declared a quarterly dividend of 1¾ per cent on the first preferred stock, payable in first preferred dividend certificates, deliverable April 1 to stockholders of record March 15; it will be due April 1, 1920, with interest at 6 per cent payable semi-annually. The dividend certificates are subject to redemption at face value, with accrued interest.

—

Ohio Jobbers Organize

COLUMBUS, OHIO, Feb. 13—The Ohio Automobile Accessories Jobbers' Assn. was organized here recently by representatives of eleven jobbing houses in the Buckeye State, during a special meeting of the Ohio Automobile Trade Assn. The organization has for its object the good of the jobbing trade and the bettering of relations between manufacturer and jobber.

The organization will be affiliated with the National Assn. of Automobile & Accessory Jobbers with which practically all of the members are individually affiliated. A committee on membership and another on constitution and by-laws were named to report at a meeting to be held in Cincinnati March 18. The membership committee consists of H. G. Smith, Cleveland; A. I. Fishbaugh, Columbus, and Victor Moon, Toledo. The constitution and by-laws committee consists of J. C. Hipp, Cleveland; H. H. Brenner, Dayton, and E. C. Deardorff, Toledo.

Officers were elected as follows: President, H. M. Dine, Canton; vice-president, J. C. Hipp, Cleveland; secretary, Victor Moon, Toledo, and treasurer, H. H. Brenner, Dayton.

These firms are represented in the organization: J. I. Cooper Rubber Co., Cincinnati and Columbus; Dine-DeWess Co., Canton; Fen-Far Co., Cleveland; Justus & Parker Co., Columbus; Griswold-Sohl Co., Columbus; Ohio Rubber Co., Cincinnati; Roberts Toledo Auto Co., Toledo Rubber Co., Toledo Tire & Supply Co. and the Union Supply Co., Toledo.

—

Faeh Returns to Baker R. & L.

CLEVELAND, Feb. 10—A. C. Faeh, who resigned as advertising manager of the Baker R. & L. Co. to become sales and advertising manager of the Osgood Lens & Supply Co. of Chicago, has returned to his former position.

—

Walsh Joins Randall Agency

DETROIT, Feb. 10—Robert Walsh, former advertising manager of the Maxwell Motor Co., Inc., has joined the Fred M. Randall Co., advertising agents.

—

Mackie Joins Saxon Sales

DETROIT, Feb. 9—J. H. Mackie has been appointed assistant sales manager of the Saxon Motor Car Corp. He formerly was president of the Mackie Motors Co. of Des Moines.

—

Detroit S. A. E. to Hear Schipper

DETROIT, Feb. 12—At the meeting of the Detroit Section of the Society of Automotive Engineers to be held at the Hotel Pontchartrain Thursday, Feb. 21, J. Edward Schipper, Detroit editor of The Class Journal Co., will deliver a paper entitled "Automotive Design and Transportation as Developed by the War." The paper will deal with efficiency in transportation, the influence of war time on the buying public, and improvements in design during the past year with reference to future trends.

—

Madden and Andrews Back from France

WASHINGTON, D. C., Feb. 11—Col. John F. Madden and Major Joseph Andrews, both of the American Expeditionary forces, have returned to Washington from France, where they have been engaged in motor transportation work under General Pershing. They are at present conferring with Col. Chauncey B. Baker, giving him messages from General Pershing, dealing with the motor truck experiences he has had in France.

—

Hupp Production 1250 a Month

DETROIT, Feb. 12—Since November the average production of the Hupp Motor Car Co. has been at the rate of 1250 cars per month, or between 40 and 50 per day.

Digitized by Google

Working Standards Set by Sharpe

Major-General Says Good Hours and Wages Essential to High Wartime Production

WASHINGTON, Feb. 13—"Industrial history proves that reasonable hours, fair working conditions, and a proper wage scale are essential to high production," says Major-General Henry G. Sharpe in a pamphlet which is being circulated under the title "Standards of Employment in War Work." The principal recommendations are:

1. A day's work should not exceed the customary hours in the establishment and should not be longer than 10 hours for an adult workman. For women, an effort should be made to restrict the hours to eight. Eight hours should be the limit for a shift.
2. Overtime is tacitly recognized as unnecessary and undesirable and should be discouraged. The employment of women on night shifts should be avoided as a necessary protection.
3. There should always be one day of rest in seven and the half-holiday on Saturday is advantageous throughout the year.
4. An effort should be made to maintain temperatures in workrooms and factories as nearly normal as possible.
5. Wages should not be lowered beneath an established standard and should be increased in relation to increases in the cost of living.
6. At least 30 minutes should be allowed for meals and this should be increased to 45 or 60 minutes if the working day exceeds eight hours.
7. No children under 14 should be employed under any conditions and children between 14 and 16 should not be employed more than eight hours a day and night work is prohibited.

—

Garford Overland Deliveries

LIMA, OHIO, Feb. 11—The Garford Motor Truck Co. is making one of the largest overland deliveries of trucks ever attempted at one time. A fleet comprising thirty-eight trucks of all the various models from 1½ to 7 tons capacity left the plant at Lima last Wednesday in the face of the most severe weather conditions imaginable. Battling with snow drifts mountain high over roads that had become well nigh impassable, these freight haulers are bucking their way over a long haul to New York City. The itinerary for this run includes Findlay, Fremont, Oberlin, Cleveland, Warren, Beaver Falls, Pittsburgh, Philadelphia, and over the Lincoln Highway to New York City.

—

Gier Steel Re-elects Officers

LANSING, MICH., Feb. 11—At the recent annual meeting of Gier Pressed Steel Co. stockholders all the old officers of the company were re-elected. These are: President, W. K. Prudden; vice-president, Harry E. Bradner; secretary and general manager, Burton S. Gier; treasurer, D. F. Edwards. These officers constitute the board of directors. A stock dividend of 25 cents per share was declared. Since its last annual meeting the Gier Pressed Steel Co. has completed and equipped its new factory home on North Larch Street, at an expenditure of $650,000. The company has an authorized capitalization of $1,000,000 and has a substantial business in its regular lines in addition to government work.

—

Farm Tractors Follow Automobile Design

(*Continued from page* 379)

cut out of the engine and there has not been any added cost by the weight reduction; but the company further states that nearly 600 lb. more could be cut out of the weight if the maker would accept a $50 increase in the manufacturing cost.

Other makers have changed the rear wheel designs with a cut in weight into the bargain. Parrett has a new tractor; similar in design to the present one but with a new design of gearbox giving three forward speeds instead of two. It has enclosed internal gear drive to the rear wheels which gives a lighter construction. In this new model a new type of Buda engine is used which has forced feed oiling to all of the engine bearings and also has detachable cylinder heads. The price is $125 more than the old model.

Each year sees the average tractor tend to the three-plow machine, although the four- and six-plow machines still have a following. The three-plow job is the one with the greatest field.

There are fewer of the huge traction engine types pulling ten or twelve plows than there were a year ago.

The use of the four-cylinder engine has made much greater progress in the last year than was expected. It is now the recognized type of tractor engine, and the two-cylinder opposed design and the two-cylinder twin design are not so strong in totals as a year ago.

Remy is another example of how the automobile industry is working in the tractor field and is showing for the first time a special electric motor governor and also a water- and dust-proof magneto, which is exhibited operating in a bell jar through which passes a veritable cloud of dust and also in a basin of water with a spray constantly playing over the magneto. Remy shows a complete tractor electrical system, including the electric governor, a generator and combined ignition and also a special starter, which is soon to be equipment on a new tractor design.

This indicates the entry of the thin edge of the wedge in the extended use of electric equipment on tractors, the possibility of women and perhaps maimed soldiers having to operate tractors lends importance to the desirability of having tractors as easily operated and controlled as possible.

A subject generally discussed with tractor makers is that the efficiency of the machine is cut down by the slow speed at which it must operate due to plow design and it is generally elieved that the design of plows must be changed to permit speeds of 3 and 4 m.p.h. and maybe higher speeds can be made when the ground is suitable.

Official Sanction for Army Sales

Before Selling Supplies to Officers, Dealers Must See Proper Authority

WASHINGTON, Feb. 11—Purchasers of supplies for government-owned cars and trucks must have official sanction, and dealers must insist on seeing proper authority before selling supplies to uniformed soldiers or officers.

When an officer or private requires supplies for a car or truck owned by the government, he must first obtain from the officer in charge of his division, written permission to make the purchase. This officer obtains the authority from the highest officer in charge.

A dealer selling supplies to an officer or private, should ask to see this written authority, and make a note immediately of the organization number, the name of the officer who signed the purchase order, and the name of the purchaser. The bill should be sent by the dealer to the Depot Quartermaster in charge of that section of the country where the purchase is made. The bill should be an itemized account of all articles bought, and to get recognition, should give the organization number, the name of the officer who signed the purchase order, and the name of the purchaser.

Each dealer should be sure, in every transaction of this sort, to obtain a written receipt from the purchaser.

—

Teetor-Hartley Plant Closed by Coal Shortage

INDIANAPOLIS, Feb. 13—The plant of the Teetor-Hartley Motor Co. at Hagerstown, Ind., has been closed for one week because of a lack of coal. Industrial coal consigned to the company was confiscated before its arrival for other purposes. About 200 men were thrown out of employment.

—

Fuel Tanks and Other Sheet Metal Parts

(*Continued from page* 365)

selves. These shells are usually made of No. 18 and No. 20 gauge material. The shell, of course, carries the hood lacing and the hood rod support. Formerly the shells were made with the regular offset hood ledge, but this is now being done away with, the hood being designed to rest directly on top of the shell.

In truck radiators it has been customary to use cast tanks and cast spacers or side members, but pressed steel is now coming in, as the makers are glad of a chance to reduce the weight on the front wheels. The pressed steel shell may be a little more expensive than cast iron, but it affords a better finish and it eliminates danger from frosts. Such a shell can be made just as rigid as required.

Utah-Nevada Highway Bill Passed by Senate

WASHINGTON, Feb. 11—The Senate has passed a bill granting to the Lincoln Highway Assn. a right of way 500 ft. wide, passing through the public lands of the United States from Tooele County, Utah, to Granite, Mo. and thence west through Nevada to Overland Canyon and 10 miles into the canyon, a total distance of between 400 and 500 miles. The bill also gives the association the right to take materials on adjacent public lands for the construction of the highway.

Before the bill becomes effective, a map of location and an outline of rules and regulations by which the association will govern the highway must be filed with and approved by the Secretary of the Interior. The association must construct the highway within 5 years after the Secretary of the Interior has given his approval.

It is understood that F. A. Seiberling has contributed $100,000 for this work, John N. Willys $50,000 and Carl Fisher $25,000.

—

Boston A. A. Recruits Mechanics

BOSTON, Feb. 9—Through the efforts of the Bay State A. A. the Federal government obtained 100 skilled motor mechanics for the ordnance and aviation forces last week. When the notification came, Secretary J. Franklin Brown called up members of the club, visited motor dealers, and secured the co-operation of the newspapers in a campaign to enlist the men. His efforts were more successful than the army officials expected, and he has received a letter of thanks from Secretary Baker.

—

Cincinnati Speedway to Be Preserved

CINCINNATI, Feb. 13—The Cincinnati Speedway Co. has been placed in the hands of Harry S. Leyman, former president of the company, as receiver. This action was taken to preserve the plant, which would have cost $20,000 per year to maintain and on which the directors had previously decided there would be no racing during the period of the war.

—

Oil Situation Improves

HOUSTON, TEX., Feb. 10—With the end of labor troubles in the Gulf States oil production is increasing and many new wells are being drilled. The number of completions during January is the greatest in several months. The original discovery field at Spindle Top is showing evidences of revival and last week a well of 200 barrels daily flow was brought in at a depth of 800 ft. Oil operations continue to center around Goose Creek, which is the largest producing area in the Gulf territory.

—

2000 Mechanics Trained Each Month

KELLY FIELD, SAN ANTONIO, Feb. 13—The training school for enlisted mechanics at Kelly Field is turning out graduates at the rate of 2000 a month and assigning them to squadrons for the care of engines and airplanes. New students come in and a class is formed every two weeks. The school is under the command of Major George E. Stratemeyer, who came here from Columbus, Ohio, recently. The mechanics' school here has been completely organized on a war basis and has three departments of instruction. They include a department of aeronautical instruction, a department of trades, and a department of motor instruction.

—

Rockford Dealers on Cash Basis

ROCKFORD, ILL., Feb. 13—At a recent meeting some of the principal members of the Rockford Automobile Dealers' Assn. voted to go on a cash basis and also to use the trade acceptance system. The Joslyn Automobile Co. has cut down the number of its charge accounts from 1250 to 207, and will do all other business for cash or acceptance, the latter being due on the 10th of the month following the date of purchase.

Calendar

ASSOCIATIONS

April 18-20 — Cincinnati, Fifth National Foreign Trade Convention.

June 5-12—Hot Springs, Va. National Assn. Automobile & Accessory Jobbers.

"and the upholstery is filled *with* Wilson Woven Curled Hair"

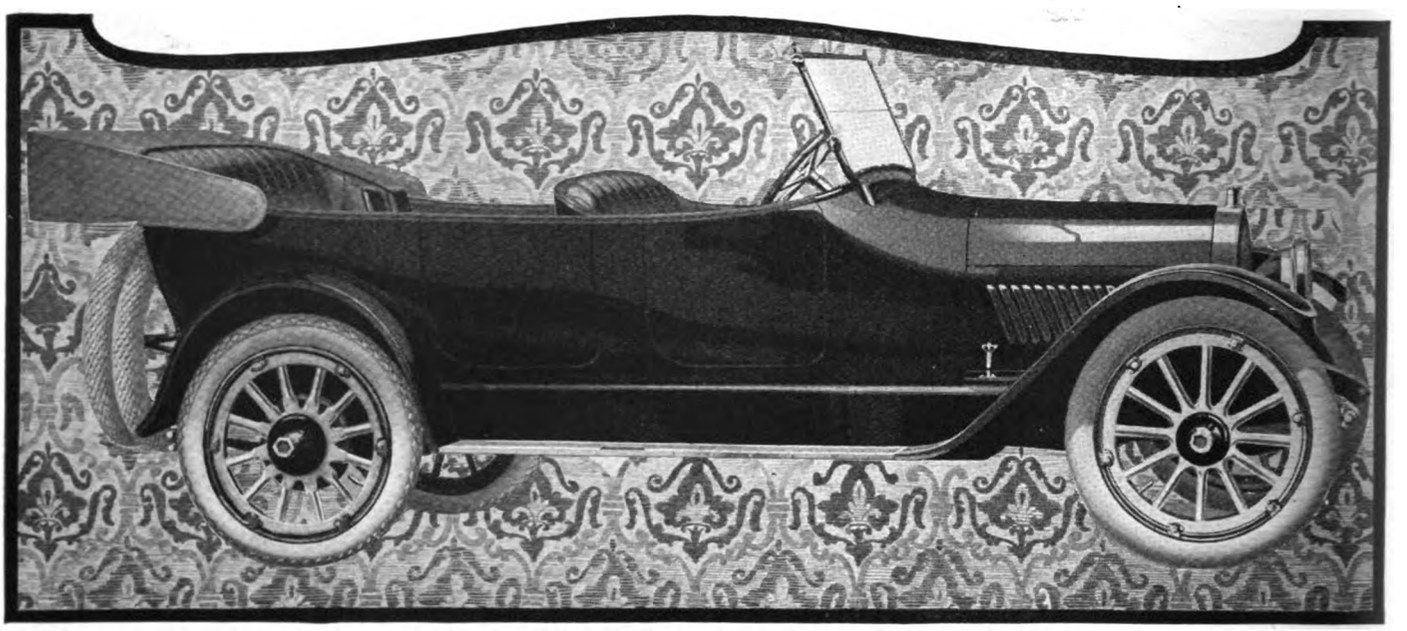
THE upholstery is an important point in the sale of a car. The salesman, as well as the purchaser, is greatly interested. If the upholstery is really good the salesman will take particular pains to point out its goodness.

Motorists have found from experience that a car with poor upholstery is not satisfactory.

Wilson's Woven Curled Hair in the cushions of a car is an assurance that those cushions are the best that can be obtained, and that the upholstery will prove more satisfactory in every way.

MADE by an exclusive, patented process, Wilson's Woven Curled Hair will not shift, mat down or become bunchy. Yet this process, which firmly imbeds the curled hair into a fabric base, does not impare its resilience in the slightest degree.

Wilson's Woven Curled Hair is more economical to the automobile manufacturer for it reduces labor costs and is more easily applied.



Many car manufacturers send us blue prints of their seats and backs and have Wilson's Woven Curled Hair cut to fit exactly.

We make a specialty of cutting plaits, or pipe fillers. Write us stating your requirements or send blue prints, and we will submit prices and samples.

Oldsmobile

Sets the Pace
20th Year

The one tremendous success in a light weight Eight at a moderate price

Today's demands for action, efficiency, thrift, conservation, find their true answer in the Oldsmobile Eight. Its instant response, power, speed and extreme flexibility command the admiration of active men and women who accomplish things.

An Idling Pace—A Thrilling Speed

Wrought into the high-speed, 58-H. P., 8-cylinder motor is a new feature, giving two distinct power phases. Idle along at a modest pace from one or two to twenty miles an hour on a lean, gas-conserving mixture. *Gentleness, economy!* Then when the need arises, open up! A complete change comes over your car. *Power, speed* in untold reserve.

In addition, distinctive beauty of line and choice coach finish contribute to the complete desirability which makes the Oldsmobile the *efficient* and *successful* selling proposition for the dealer. Write, wire or phone the factory today.

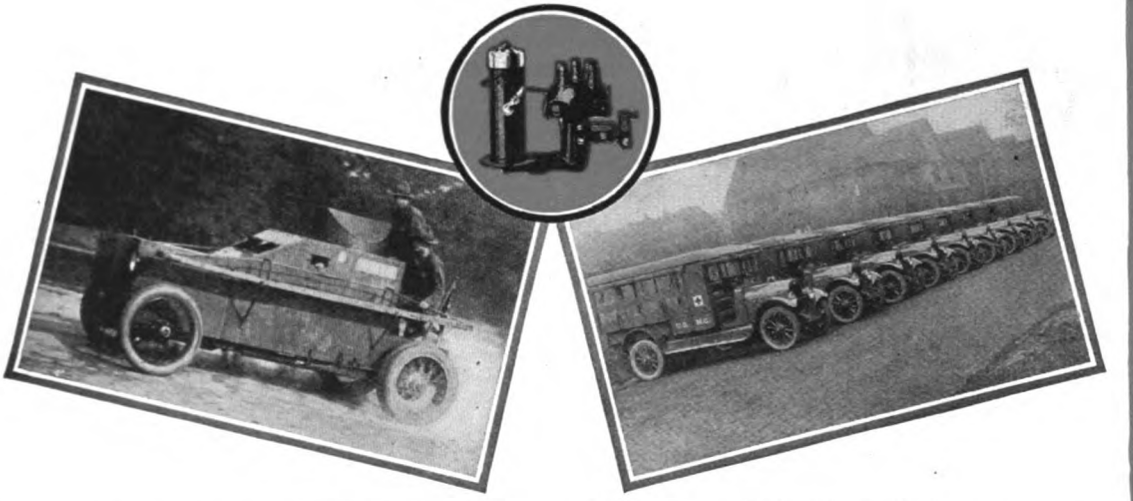
ATWATER KENT

SCIENTIFIC IGNITION

The Atwater Kent Equipped King "8" Is Doing War-Time Service



THE standard King "8" Chassis, Atwater Kent equipped, after passing rigid government tests is now serving the colors as armored car and motor ambulance.

Atwater Kent Ignition has helped this pioneer eight live up to its name of "The Car of No Regrets."

The uniform, hot, fat spark furnished by Atwater Kent Ignition plus its simplicity of construction and unfailing performance has contributed in a large measure to such notable feats as the recent 7-day non-motor-stop run, the high-gear climb of Mt. Wilson, and the "sealed-in-high" non-stop and fuel economy tests in various states.

To be the Atwater Kent dealer in your community is to tie up with a liberally advertised line that has received the approval of over 400,000 motorists and over thirty manufacturers of cars, trucks, motors and tractors.

Write to 4938 Stenton Avenue for booklet "Selling Atwater Kent Ignition"

Drift with the Zephyr and keep the breeze at your back

Race with the Gale and put the wind in your face

The Peerless Dealer's Big Advantage

Like a feather on a fitful summer zephyr the Peerless Eight will pause and drift or dart this way or that with the changing current of congested city traffic.

But at will, you can utterly change its character. You can transform that delectable softness into resistless power and speed.

The "Loafing" Range

For every need in ordinary driving you will find response, entirely within its "loafing" range, that will completely answer your every demand for ultra soft, smooth, lively, performance.

Yet in its "loafing" range the Peerless Eight is on half rations —consuming fuel so sparingly as to shame many a lesser powered six, even many a four.

For the Peerless Eight with its two separate and distinct power ranges is capable of exactly opposite kinds of performance.

You have eighty horsepower under the most remarkable control. You may drift with an idle zephyr and hold it back, or, in a flash, you may race with the gale and keep the wind in your face.

The new Two Power Ranger accentuates those delightful contrasts of performance that distinguish the Peerless Eight among even the master cars of the day.

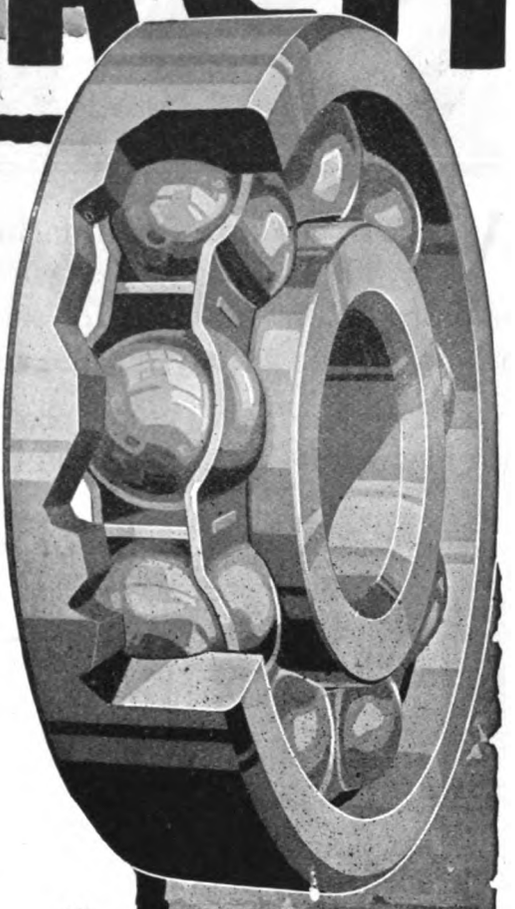
The Peerless dealer has a big advantage in being able to show his prospects motoring thrills which no other car can duplicate.

TWO POWER RANGE **Eight** 7-PASSENGER TOURING **$2340**

Roadster $2340 Sporting Roadster $2490 Coupé $2850
Sedan $2990 Limousine $3690

All prices f. o. b. Cleveland—Subject to change without notice

The "Sporting" Range



To reach its "sporting" range and utterly change its character, you have only to open the throttle wider and release its double poppets.

Now you have eighty horsepower, full fed and eager for conquest. You need fear no contender, no matter what its class —in a test of speed or prowess.

The Peerless Motor Car Company, Cleveland, Ohio

RESEARCH

NEW DEPARTURE BALL BEARINGS are the result of continuous and intensive study by *experts* — metallurgists, chemists and engineers — for many years.

It has called for the best that is in these experts to bring the New Departure quality up to the present New Departure standard.

Having obtained knowledge of fundamental essentials, we do not rest in our research work. A considerable engineering force is constantly employed, applying irresistible tests of science to New Departure materials, processes and the finished product. Thus we maintain day in and day out, what we have attained.

"New Departure Engineering Bulletins" show practical and progressive applications of ball bearings to all types of machinery. Engineering consultation service free and confidential.

"—getting started in cold weather used to be a drain on my battery and patience but not since I put Philbrin Duplex Ignition on my car"

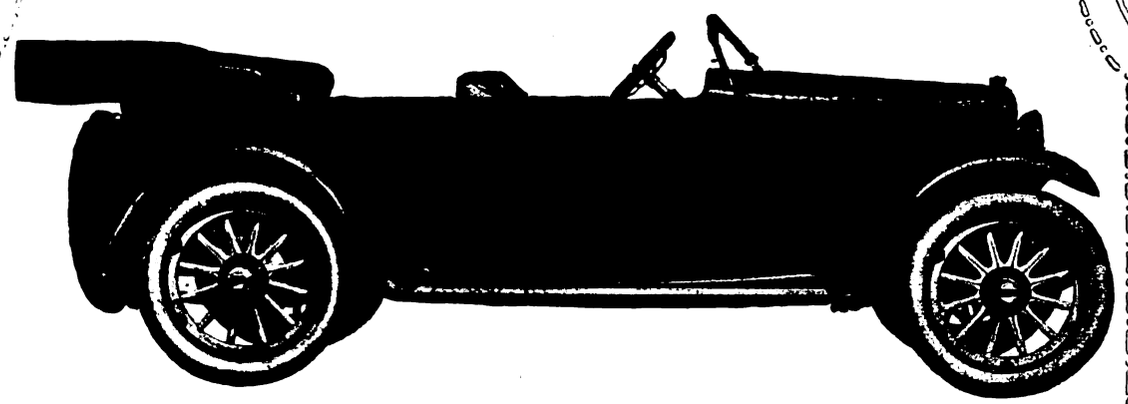
Only three parts—a combined switch and magnetic interrupter, a coil, and a distributor.

WITH the thermometer down to zero I can now leave her standing at the curb for hours at a time, but when I throw the switch to "H" she starts without a single protest.

For with the switch on "H" the Philbrin High Frequency System shoots a steady stream of hot, dynamic sparks into each cylinder in its regular firing order. No mixture, no matter how poor, can resist under persuasion as powerful as that.

That's the purpose of the Philbrin High Frequency System—to overcome abnormal motor conditions such as faulty carburetion, foul spark plugs, inferior gas and excessive carbonization—conditions that no single system alone could be expected to meet.

The Philbrin Single Spark System likewise deserves special notice because of its many unique points of superiority over any other single spark system. Its patented Contact Maker provides for an extremely hot, full-bodied spark from astonishingly little current and fires lean mixtures successfully. And it is a well-known fact that lean mixtures, though more difficult to ignite, are more powerful when fired. Actual, appreciable economies of fuel are assured together with greatly improved flexibility since, unlike others, the Philbrin Single Spark System provides its hottest spark at low speeds.



While combining two separate and distinct ignition systems, the entire Philbrin Duplex System is no larger than the average single unit system and may be installed with equal facility. Made in sizes for all cars with special mountings for magneto replacement. We make a specially designed system for Fords.

Jobbers and dealers will find unusual possibilities for profit in this new and better system of automobile ignition. Write at once for unassigned territories.

When Price Talks

Judged by Values, the New Case Six Commands the Keenest Buyers' Interest

FORTUNATE is the man, when he comes to buy a car, who lets Case standards guide him. At its present price, the New Case Six is a rare find. Compared with like cars, its price is below the usual. That is evident. Cars built in the Case way command several hundred dollars more. Yet none have all the Case attractions.

This means double value. A lower cost with high-price features.

The All-Feature Car

Combined in the Case Six, as never before, are all the best known and most desired features. Features known as standardized and best. Known to all makers, to all owners, to all garage-men, everywhere.

All these features, from the Continental Engine to the tiniest detail, are selected especially for the Case Six. And meet the standards set by Case Engineers.

All features are harmonized into a satisfying unit. Such as set by today's requirements. And these are the statements, remember, of a 76 year old concern, jealous of its good name.

A Timely Car

Up-to-the-minute in design and comforts, yet free from extravagances, this New Case Six is indeed timely. Especially at its price.

The New Case Six comes in three models, each a beauty. Each expresses individuality. Their riding comfort is unequalled.

And there is plenty of power, developed smoothly and noiselessly, and transmitted completely into driving force. There is more power than any driver needs. All with real fuel economy.

Before You Buy

See the wonderful New Case Six now. Go over its specifications; examine it minutely. Make comparisons. Ride in it. Give it every test you wish.

Then see if you agree with us—that here is a car of unusual merit at an unusual saving.

A Case dealer will be glad to show you the Case Six. Or write direct to us for a descriptive catalog with pictures.

J. I. CASE T. M. COMPANY, Inc. Founded 1842. 227 Liberty Street, Racine, Wis.

TO DEALERS: A few fine opportunities exist in certain localities. Write for information.

Family Touring car for 7 or 5 people, color dark blue, $1875; Sport Model for four people, color periscope green, $1875.

All-Seasons Model, Springfield Type, for 7 or 5 people, color dark blue, $2375.

SERVICE

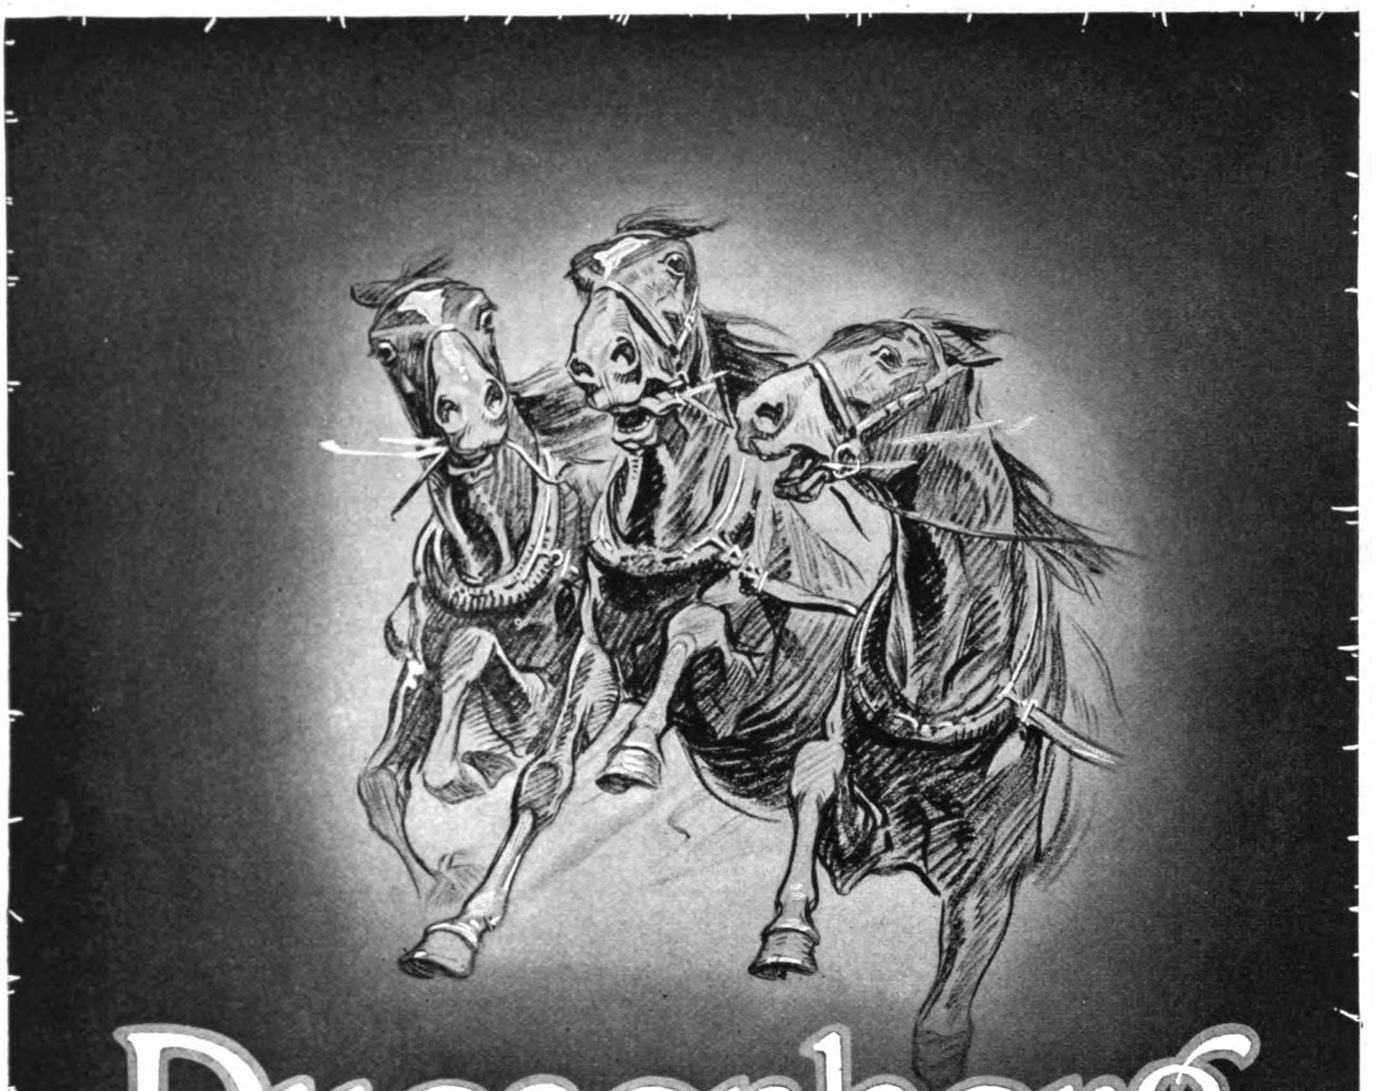
Service is the watchword of the times.

The war can be won only by unstinted service.

The outcome depends as much on the machine as on the soldier.

In every field of mechanical design, nothing is or can be neglected that will directly or indirectly give increased service.

Thus it has been proved anew, and in every field in which steel is used, that



VANADIUM STEEL

means service. In aeroplane, submarine, gun, army truck, light and heavy armor, automobile, locomotive, machine and cutting tool, the greater strength of vanadium steel is utilized to the one end—increased service.

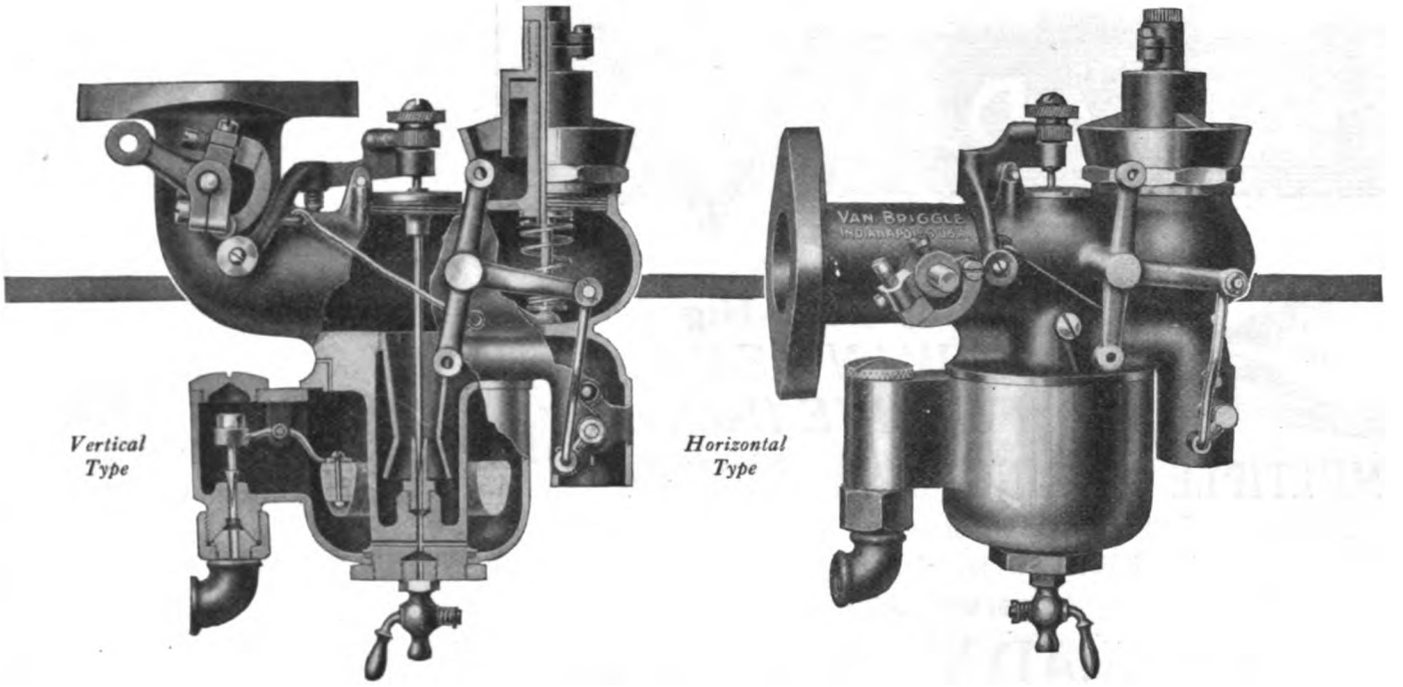
DRIDEK—

With the Leather Finish

TRADE DRIDEK MARK REG.

DrideK with its leather finish, is an entirely new creation, based on many years' experience in furnishing tops and upholstery for the majority of the cars that have been put on the market.

DrideK looks as well as the best of leather. The distinguishing features in the wear of DrideK are: that you cannot scratch the finish; that it retains its color until entirely worn out; and that it is absolutely waterproof.



The product is unquestionably superior, and the price is within reach of your specifications. Made in black and many attractive colors.

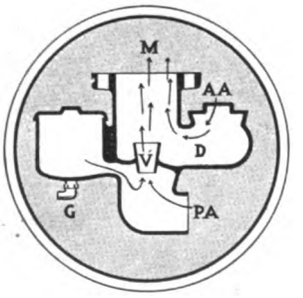
VAN BRIGGLE CARBURETOR

Just One Principle for all Motors

THE principle of carburetion is *always* the same in every Van Briggle Carburetor—regardless of the make, number of cylinders, or type of motor on which it is used. Thus, uniformly good results are always secured. The Van Briggle delivers more power—more speed—with less fuel—and gives *instant* starting in coldest weather. There's a Van Briggle for almost every make of motor. Illustrated descriptive booklet sent free on request. Send for it. ¶DEALERS AND JOBBERS: The Van Briggle is as easily handled as tires. New opportunity for profit and service. Write for proposition.



KEY TO DIAGRAMS: PRIMARY AIR (P. A.); AUXILIARY AIR (A. A.); GASOLINE (G.); MANIFOLD (M.); MIXING CHAMBER (D.); VENTURI TUBE (V.); LOCATION OF MANIFOLD ON HORIZONTAL TYPE (Z.).

The Van Briggle Way

EXPLANATION OF DIAGRAMS

Because of the peculiar construction of the Van Briggle's primary air chambers, the primary air enters the venturi tube in a whirling, swirling movement, breaking even the poorest gasoline into the most minute particles. The primary mixture then enters the mixing chamber. The auxiliary air, traveling across to the manifold MUST PASS THROUGH THE PRIMARY MIXTURE. Two mixtures are thus assured in the Van Briggle Carburetor—each thorough and absolute. A thorough mixture and complete vaporization mean EVERYTHING to your motor. Compare the Van Briggle Way with The Other Way. There *is* a difference!

DILLON MULTI VISION LENS

Motorists!

Here is a Lens that *does* what others *claim* to do

THE Dillon Multi-Vision Lens has no prismatic surface, no colored glass, no obstructions of any kind, to obstruct the light you need at night.

Instead, this marvelous lens embodies a new method of light distribution, which enables you to secure the fullest possible road illumination, and yet the lens itself is glare-free.

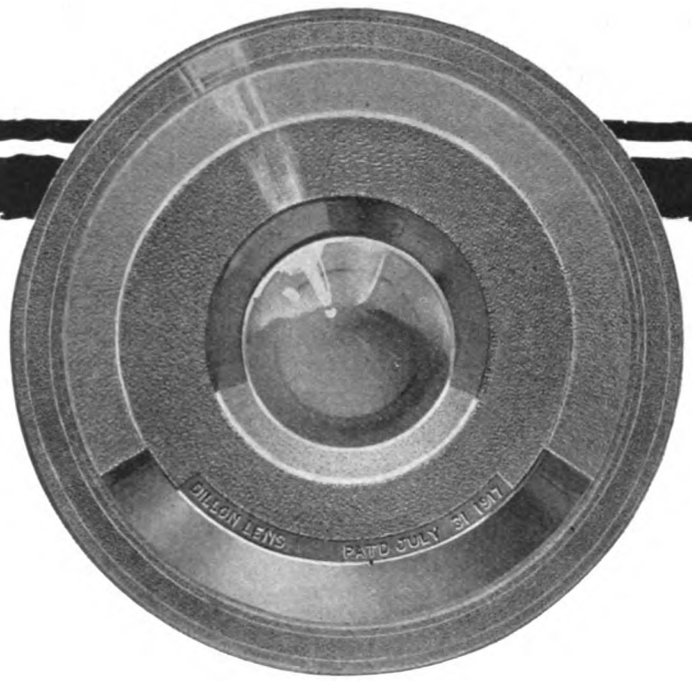
So scientific is its design that you actually secure TWICE the lighted area. Because of its projecting face you get a greater degree of side light, and its central bull's eye (which concentrates and magnifies the light) gives you a brilliant though glareless long-range shaft of light.

Dealers!

This, at last, is the Lens your trade will want — and *boost*

A SATISFIED customer is your best asset. Your whole stock moves more quickly, your profits increase as well, if your patrons find your products satisfactory.

The Dillon Multi-Vision Lens proves not only the ideal lens to buy but the most profitable lens to sell. The Dillon serves as a nucleus for a fast-growing, high-class trade, because it justifies the claims of both maker and seller.



Don't forget to mail the coupon below and secure full information on the Dillon Lens sales proposition, as well as particulars regarding the co-operation offered Dillion dealers. Send the coupon at once.

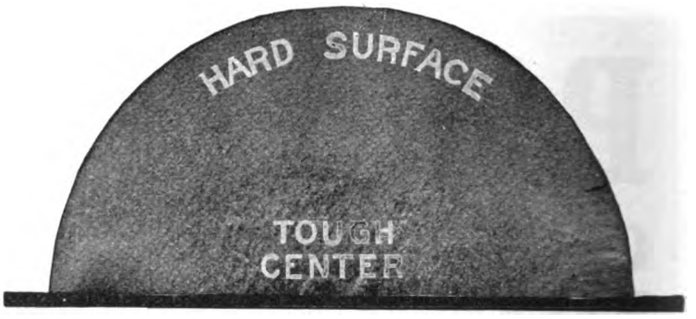
GALVANIZE RIMS AUTOMATICALLY IN MEAKER UNITS



Deposit a heavy, bright, uniform coating of pure zinc on all rims for your cars—the galvanized finish that looks good and is good.

Well galvanized rims are bright when they come from our machines and just as bright after they have made many thousand miles on your machines.

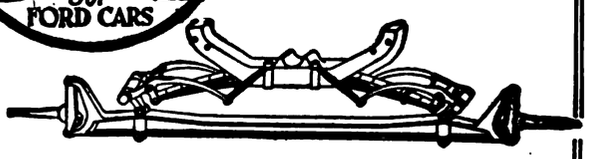
Superior Meaker Galvanizing will not cost you as much to produce as out-of-date, inferior, dark-colored, thin zinc coatings that do not even protect rims from rusting while they lie in storage.

Forward us a set of rims and felloe bands and we will give you some interesting figures.

MEAKER GALVANIZING COMPANY
1249 Fulton Street **Chicago, Illinois**

Steel balls look alike

TWO steel balls may look alike as two peas; the finish and size may be the same. It is the **internal construction** that counts. Until the Hoover Steel Ball was developed, you could not buy a ball with practically a **guarantee against breakage.** Yet with 25,000,000 daily capacity, **in four years we have not had a single case of breakage reported in service.** Easy to understand—the Hoover Ball is of chrome steel, hard surface, tough center, **eliminating breakage** by providing for steel contraction and expansion and allowing for fatigue in service.



We maintain a special research laboratory to make the ball to order for your service. May we send our booklet?

In this time of nation-wide economy, are you finding ways of cutting costs—and still retain quality? One item of saving—and it's no inconsiderable part of motor equipment either—is

GLASS

We have a mighty acceptable substitute for polished plate; and whether you use it on closed cars, windshields, clock faces, oil gauges or what-not, you will find it optically perfect. It looks well, too—and of course it's very moderately priced.

Write us your requirements, and let us tell you why this glass will serve your needs so well, why it costs less—and all about it.

AMERICAN WINDOW GLASS CO.
World's Largest Producer
General Offices, Farmers' Bank Building

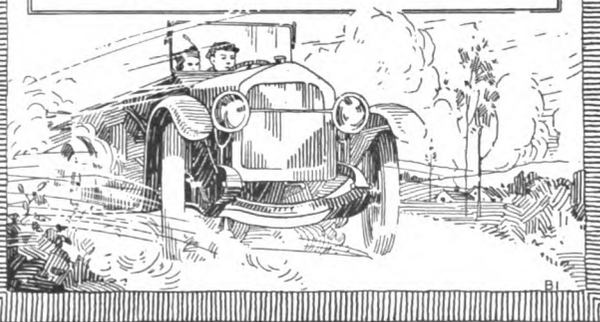
Save Extra Auto Tax

Every ounce of energy wasted by leaky cylinders is an *extra* tax on your auto or truck. And that tax grows with advancing gasoline prices.

Stop this costly leakage with Ever-Tight Piston Rings.

Accurately machined from fine-grained, springy grey iron, they hug the cylinder wall closely without binding. Conform exactly to out-of-round cylinders, saving reboring. Gas can't leak through or by them.

Ever-Tight Piston Rings are safeguards against imperfect combustion with resultant carbon deposits; against smoky exhaust resulting from oil leaks. They increase engine efficiency from 15% to 25%, thus reducing running expense.



Demand Ever-Tight Piston Rings of your dealer or repair man.

EVER-TIGHT PISTON RING CO.

1428 Chestnut Street :: :: Saint Louis

This perfect three-piece construction justifies the name—EVER-TIGHT. These close fitting right angles are absolutely gas tight.

Automobile Builders are using the

KANT-KLOG

Primer as standard equipment, because of its remarkable efficiency and low price.

It solves the problem of cold weather starting and can't clog with carbon.
Kant Klog simplicity is seen in the section. No part of valve is exposed.
There is clearance for free flow of gasoline without waste when priming.
There is no chance of carbon getting past and collecting on the seat. The more it is used the better its seating action.
We will quote on Kant Klogs for every type of motor. Our prices are low. Write for particulars and free sample.

Be Trained for Auto Expert

Come to the oldest, greatest and most successful, practical automobile and tractor training school. Now in its twelfth year. Thousands of graduates have been taught with the most comprehensive array of equipment ever assembled for instruction purposes. Real master instructors.

Here you can learn in a few short weeks to be a real expert to know how to operate, adjust and repair successfully and economically any automobile or tractor, also how to demonstrate and sell cars, tractors and accessories. You can be a real expert for less than you can afford to be a dub. Write for my catalog.

No. 1 Wilmarth & Morman Universal, BRAND NEW.
One No. 190 Wells BRAND NEW cutter and reamer grinder.
Two No. 3 Modern Universal, BRAND NEW.

We own and can make delivery immediately from our New York Warehouse of the above list of machines
Send us list of your surplus used machinery. Send for Catalogue

MODERN MACHINERY EXCHANGE, 52-54 Walker Street, New York City

CONTRACT WORK—Continued

Commercial Auto Bodies

All facilities for specialized manufacture. BODIES FOR FORD CHASSIS a specialty. Contract work invited. Estimates given. Also equipped for HIGH GRADE WOOD PATTERN WORK.

J. T. Cantrell & Bro.
Wall Street, HUNTINGTON, N. Y.

PISTON and PISTON RINGS

Any Quantities

GRINDING IN ALL BRANCHES.

Houpert Machine Company
351 W. 52nd St., NEW YORK, N. Y.

Metal Stampings and Spinnings

Of Any Description in All Metals
Good Service

STANDARD METAL SPINNING CO.,
138 Mott St., New York, N. Y.
Phone Canal 8727

Dies, Jigs, Tools, Gauges Fixtures

SPECIAL MACHINERY
Let us know your requirements
GENERAL TOOL CO.
59A Terrace, Buffalo, N. Y.

TOOL AND DIE WORK

Stampings—punch press work, gauges, jigs and fixtures, cutter work, machine parts, complete machines. Send your blue prints. We can give good deliveries if anybody can. Low Overhead.

SCHROEDER BROS. MFG. CO.
Torrington, Conn.

Small Tool and Gauge Makers

Also have facilities for jigs and fixtures, machine parts and special machinery.
Send along your blueprints.
Prompt Deliveries.

WHITING & COMSTOCK
32 Union Place HARTFORD, CONN.

LATHE WORK

We are particularly well equipped to handle LATHE WORK in large or small quantities.
Also SHAPER, MILLING MACHINE and DRILL PRESS WORK.
High Grade Acetylene Welding.

JOHN GREEN & SONS
221-224 N. Market St. HOOPESTON, ILL.

BRASS CASTINGS

Castings of all kinds made to order. Specialist in bronze and brass. Let us figure on your requirements.

George N. Ferguson
Lake and Crown Sts. BLOOMFIELD, N. J.

Dies, Jigs, Gauges and Fixtures

SPECIAL TOOLS OF ALL KINDS
General Machine Work
BREMER & COMPANY
139 No. 7th St., PHILADELPHIA, PA.

DROP FORGINGS

"Quick Deliveries and Accurate Work"
We can also handle some kinds of Machining and Polishing.

Bonney Vise & Tool Works, Inc.
ALLENTOWN, PENN.

SCREW MACHINE PRODUCTS

Work up to 2¼" diameter can be handled with our increased facilities.
Send us your specifications.

Thos. H. Dallett Co.
1301 Federal St., PHILADELPHIA, PA.

PATTERN WORK for AIRPLANES

The Curtis Airplane Co. profits by our Pattern Department. Why not you? Specialists in wood or metal—20 years' experience. Good work done quickly.

THE NEWARK STAMPING AND FOUNDRY CO.
Plant No. 2. NEWARK, OHIO.

If your manufacturing requirements cannot be handled by firms now advertising, we should appreciate the opportunity of locating a firm that can render such special service as your business may demand. Our investigation of the contract situation as it now stands places us in a position in which we can be of valuable service to the manufacturers of the automobile industry. If interested, please communicate with the Contract Work Department, Automotive Industries, 239 W. 39th Street, New York City.

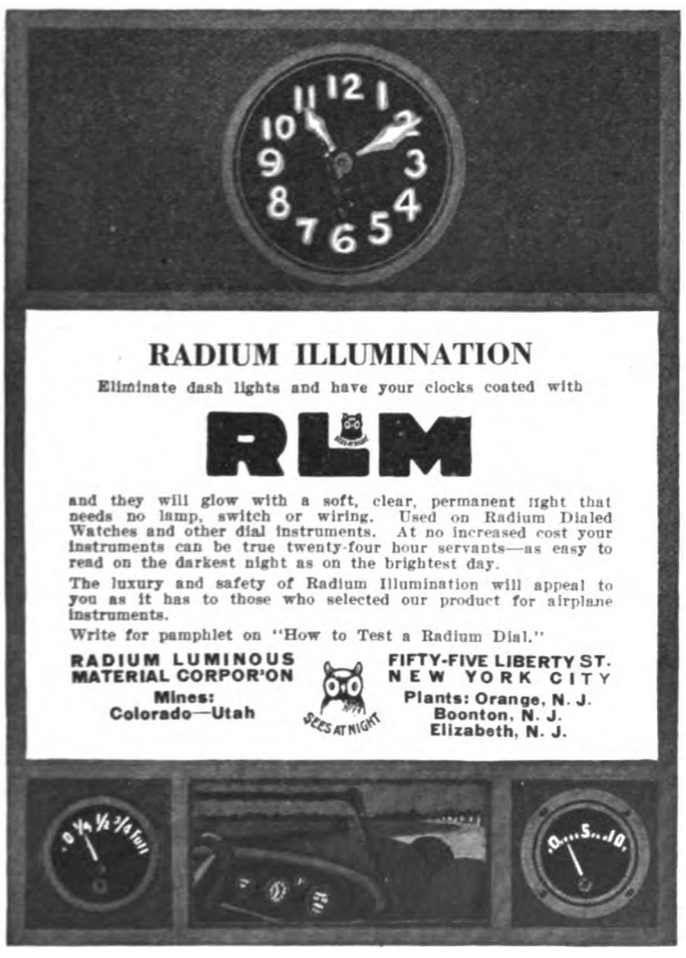
Schatz "Universal" Annular Ball Bearing



THE "Universal" is the culmination of 20 years of achievement in the manufacture of ball bearings.

It establishes a new standard for combined radial and thrust efficiency.

Our catalog and data sheets should interest all engineers of mechanisms having rotating members.

The "Universal" is made in metric dimensions to interchange with all internationally standardized bearings.

The Federal Bearings Co., Inc.
26 William Street Poughkeepsie, N. Y.

A Good Truck *Must* Have a Good Brake Lining

To the maker, the dealer, the user of trucks — ELEKTRA Asbestos Friction is of vital importance because it is the best Brake Lining that can be made. ¶With its inherent friction power, its ability to stand up under the stress of hard, constant usage and its entire dependability in emergencies—it is a protection against accident which adds mightily to the sum total of truck performance

ELEKTRA Asbestos Friction is made of the best selected materials and to exacting specifications. It is an interwoven fabric of asbestos and metal which is chemically treated to combine the heat-proof qualities of asbestos with the high friction of an indestructible material.

In spite of its unquestioned quality ELEKTRA is low in price. Our figures will prove extremely interesting to manufacturers.

in the Plant

The plant of the Central Steel Company has been pronounced by steel experts and engineers to be the most modern and complete steel plant in the world. Here is to be found every appurtenance pertinent to the production of alloy steels of highest quality.

It is also the *first* plant ever designed in which every mechanical operation is carried out by electricity.

Exactness has played an important part in the upbuilding and maintenance of the superlative AGATHON quality standard; the complete electrification of our plant has made possible exactness never before known to the steel industry.

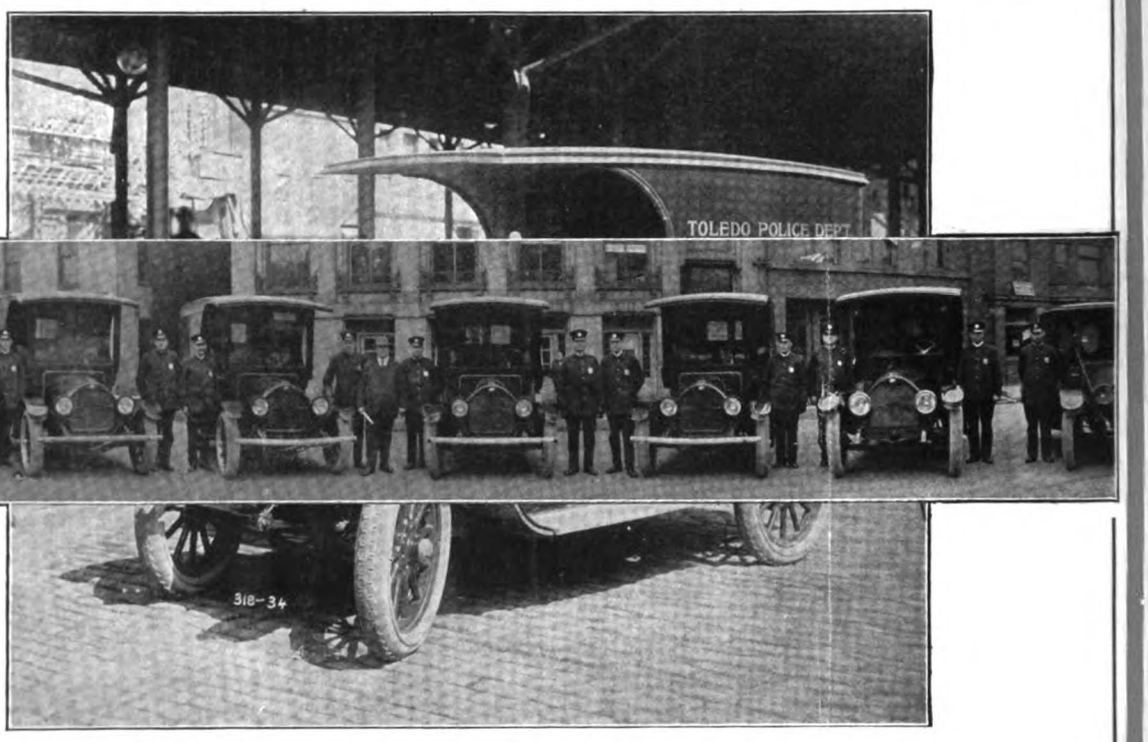
Additional Models

In addition to this list we can supply sets of wire wheels for the majority of these makes of cars of older models.

Service and Sales Agency

Established dealers can secure the Wire Wheel Service and Sales Agency where territory is vacant.

The large demand for wire wheels is rapidly growing larger. Owners of cars of all makes are realizing the safety, comfort, easy handling and-tire-and-fuel-saving, in addition to the familiar advantages of attractive appearance and quick tire change.



For dealer proposition address

Wire Wheel Corporation of America
(Successors to Houk Mfg. Co.)
835 Eleventh Avenue, at 57th Street, New York

In Ordering Wheels or Parts

Always specify make, model and year of car. Also size and type of tire, whether straight side or clincher, with diameter of hub cap at threads. This information should accompany every order for any part.

Digitized by Google

PROTECTION

TOLEDO Police Department Cars see real service—not because Toledo is more wicked than other cities, but rather because Toledo ideas of efficiency permit few cars to do silent duty in a station garage.

The emergency cars of the Toledo fleet are Overlands. They weigh 3950 pounds, light. The overhang is 3½ feet. There are always two people in the driving seat when the car is on the road, and frequently as many as ten in the car.

McNaull 33x4½ tires are the equipment on all four wheels of every car. With sixty pounds of air to the tire, McNaulls are averaging more than 8000 miles in this severe service.

The work of a police department demands action that is quick and positive, and to obtain that kind of service city governments can well afford to pay more. Actual figures prove, however, that McNaull Tires cost the city of Toledo far less per mile than any other tire, and assure an almost faultless service. The Chief has the figures. For additional information write The McNaull Tire Company, Toledo, Ohio.

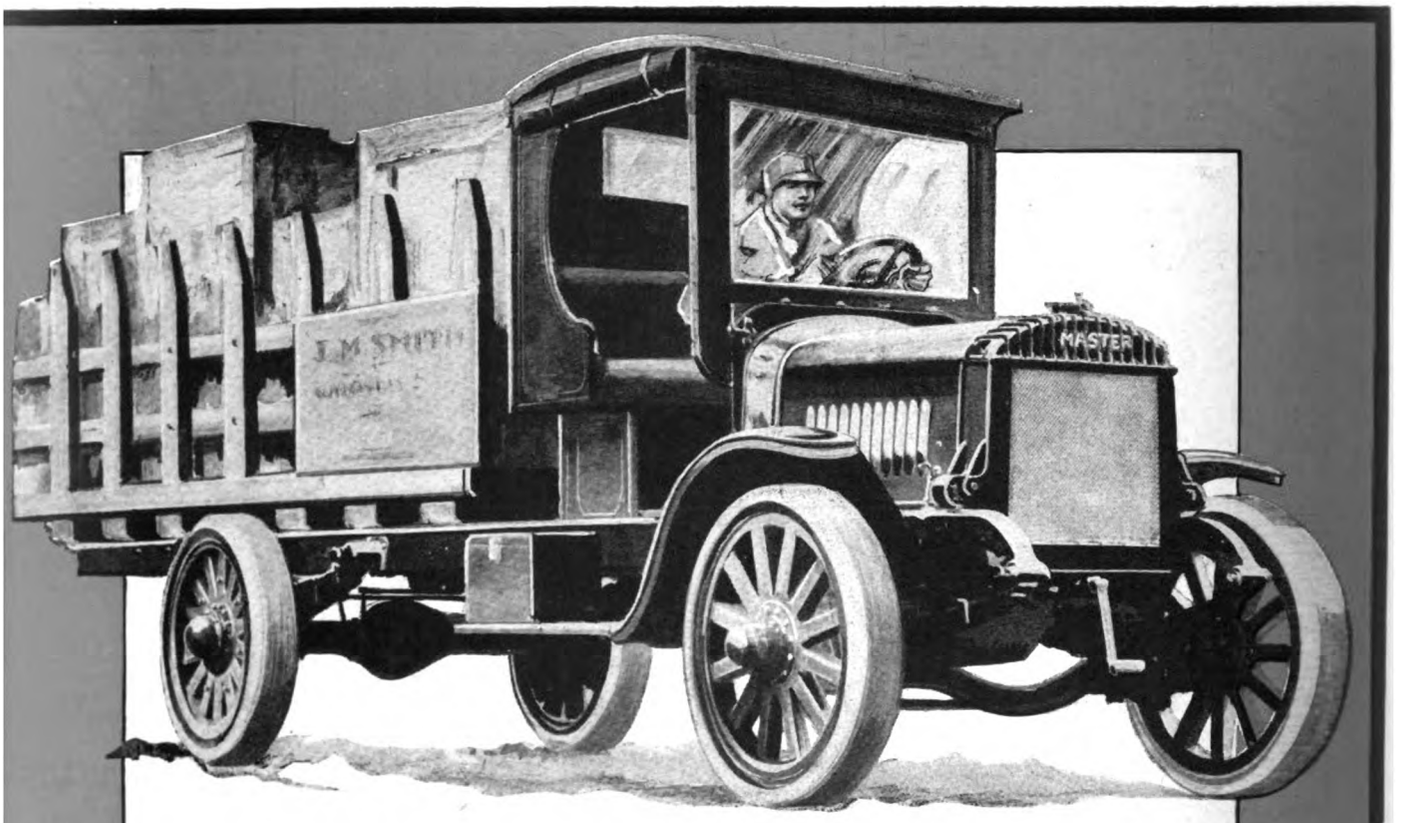
Dealers Who Delay Taking Cars Now

Will Face a Shortage When the Active Selling Season Starts Shortly

This not being an active selling season, it is quite probable that many dealers do not realize the seriousness of their position as it concerns the future. Every year at this time it is the custom of many dealers to refuse to make any definite arrangements for cars. They have been in the habit of waiting until the demand develops, and then going to their distributors for such cars as they need. They have not been taking any cars lately, and therefore probably do not realize what effect freight embargoes and other influences have had in curtailing production.

It has been impossible to make the usual overland drive-aways from the factories this winter. No dealer has any stock of Hudson Super-Sixes. The production of the new series was started in December. For days, in common with all other manufacturers, we were unable to ship a single car either by freight or by express. Several days have been taken out of production because of the coal situation. It is time taken out of a period when advanced stock is being produced for the spring demand.

With production cut forty per cent. and no one able to guess what further curtailments may be necessary because of freight, labor, coal, the war and other influences, and with the country just getting under way in the greatest distribution of money it has ever known, the prosperity is going to those automobile dealers who have the foresight to get cars just as soon as they can.



Hudsons in stock are like wheat in the bin.

Five Times Tested -and Proved!

The smoothness in action and remarkable durability of the BUDA ENGINE are the results of the finest manufacture. They are safeguarded by tests of each engine which, we believe, are of unequaled severity.

1st, each engine is run by outside power until smooth. 2nd, it is run by its own power until smooth. 3rd, it is taken apart, examined and carefully adjusted. 4th, it is run under its own power. 5th, when it runs with perfection, its power output is measured by the electric dynamometer.

The engines which survive all these tests are real BUDA ENGINES for trucks, farm tractors, or high duty stationary work.

Made by The BUDA COMPANY, Harvey (Chicago Suburb), Ill.

This Test Proves the low Freezing Point of JOHNSON'S FREEZE-PROOF

THIS illustration shows an actual demonstration of Johnson's Freeze-Proof made by The Edwards & Chamberlin Co. of Kalamazoo, Mich.

This firm writes us as follows:

"We prepared a solution exactly according to your directions and found that while the thermometer dropped to 12° below zero, this solution did not freeze."

We also quote a letter from The Motor Accessories, Inc., 165 Massachusetts Avenue, Boston.

"We wish to say at this writing, we want to compliment your company, for the wonderful co-operation that we have had towards the sale of Freeze-Proof this past season.

"We have not a package of Freeze-Proof left in stock, and sold same to owners of cars, where the prices of these cars varied from $1,000.00 to $15,000.00, and not in one instance did we have a complaint re. this product.

"This letter is unsolicited and we are willing for you to use this letter to any advantage that you may see fit."

Hundreds of other parties have expressed themselves just as enthusiastically.

Specialization Helps Tractor Industry

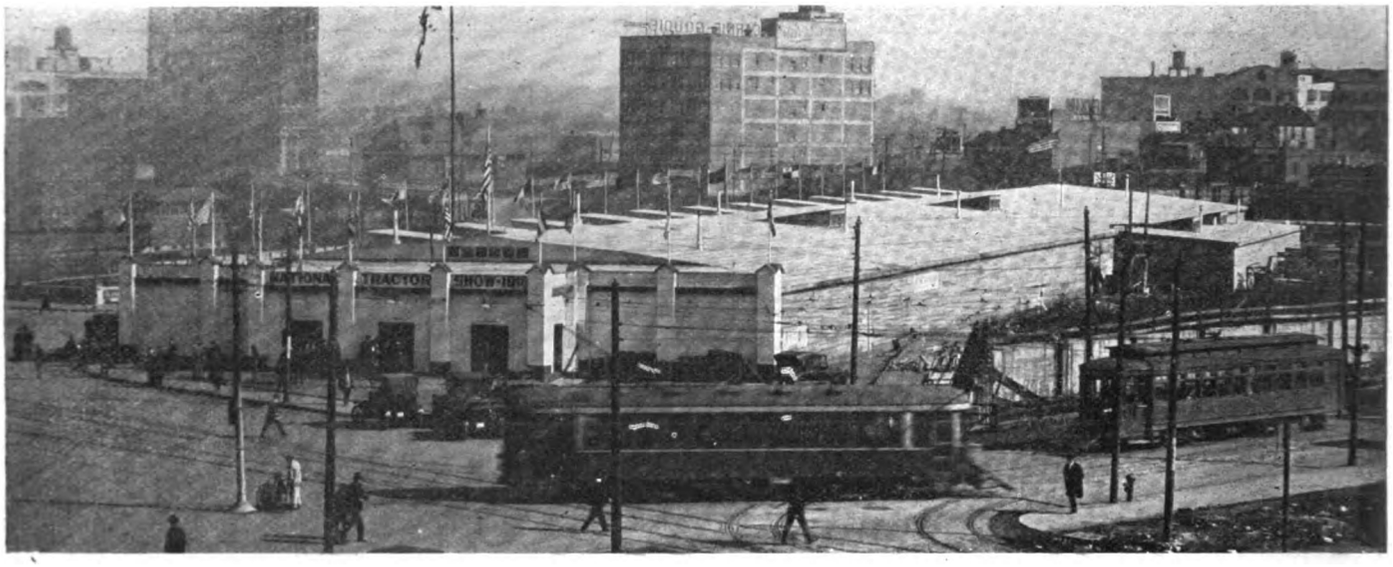
Automobile Practice Exerting Its Influence on Tractor Design—Makers of Parts and Accessories Doing Their Part —New Tendencies Revealed at the Two Big Tractor Shows

By David Beecroft

KANSAS CITY, Mo., Feb. 16.—The influence of automotive engineering on the farm tractor industry was well exemplified at the special tractor show which has been running all week and came to a close here this morning, and also at the show held in the Twin Cities last week. Between the two shows upwards of 90 per cent of the tractor industry was represented and this representation included all the large makers with the exception of the Ford, which was not represented at either show.

The interest in the tractors in both cities was greater than that in automobiles and trucks. This was natural, because of the shortage of farm workers and government demands for greater crop acreage this spring, with constantly increasing acreage during the period of the war.

Tractor engineering has made material progress during the past year, both as regards improvement in design, the use of better steels, greater use of anti-friction bearings, more efficient engines, reduction in weight, a better distribution of weight over front and rear heels, and in the more efficient protection of parts from dust and water.



Improvement Largely Internal

The story of improvement does not appear nearly so much on the surface. Externally a machine may be just about as it was a year ago, but Timken or Hyatt bearings may carry the steering and driving wheels in place of the plain bearings used a year ago. It may have an engine that has been revamped in the last year to burn kerosene more efficiently and has water jacketed spark plugs, more water space over the cylinder heads, detachable cylinder heads, looser fit pistons, larger crankshaft bearings, perhaps force feed engine lubrication, a new design of gearset with forged gears and ball or roller bearings. These are some of the more important changes that have taken place within the last year. It is a story of the influence of automobile engineering practice, but the improvement has been general, and concerns never connected with the automobile or motor truck industry have profited substantially by designs from these industries.

Many New Tractor Concerns

The unprecedented and unexpected demand for tractors has resulted in many concerns entering, and in this respect it is easier for new firms to enter the tractor industry to-day than it was for concerns to enter the automobile and motor truck industries at a similar period in their development. This is due to the ease with which tractor assembly can be carried on already. Thanks to the production lessons of the automobile industry, there are already makers profiting by the experience of five or six years ago in the automobile industry, and are making parts for tractors. Thus you can secure radiators of tested quality, and there is no activity among tractor makers, excepting those building unusual types of large machines that demand extraordinary capacity. There is not that tendency that existed in the automobile industry years ago for a new concern to develop its own type of radiator. The radiator man has already solved that, and radiator design and construction are in step with the

Digitized by Google

A special building was put up for the Kansas City Tractor Show and, though it cost over $18,000, it has been one of the best investments ever made by the trade. There were forty-three different makes of tractors on view

highest standard set in the development of the tractor.

The ease with which tractors can be assembled is further assisted by the engine development. Those engine makers who have built for automobiles and trucks have for several years been working on tractor engines and have been wrestling with the difficulties of handlng heavy fuels. To-day they have engines ready for delivery to the tractor industry. They are generally large engine concerns with capacity, but several new firms which will specialize on truck and tractor designs have sprung up. The entire knowledge of truck and automobile engineering has already been swung into tractor engine development.

What is true of engines is also true of ignition apparatus. The magneto, battery ignition, generator, starter and battery engineering practice has already taken hold of the tractor industry. The first tractor with electric starting has been on the market for some time and is manufactured in large numbers. Magneto makers have risen to the occasion to provide dust-proof and waterproof magnetos, and at the show here Remy showed its new tractor job with a spray of water constantly playing over it and another of the same design operating under a bell jar into which was injected a dust cloud.

Ball and Roller Bearings Increase

Bearing manufacturers—both ball and roller—have been active in the tractor field. Hyatt deserves credit for the pioneering work done as well as for the co-operative work carried on with tractor makers. To-day all of the ball-bearing interests are doing excellent work, and their bearings are finding increasing use in gearsets and other parts. The manufacturers of other kinds of roller bearings have been in the field, and their bearings are now found in many parts of different tractors, particularly in the gearset and on the transmission shafts.

The same can be said of carbureter makers, who brought into the tractor field their former experience and added the knowledge they had on kerosene. In handling kerosene the research work of the Wilcox-Bennett organization has been very potent in maintaining the correct perspective in using heavier fuels, and while the kerosene problem is still far from a final solution, in that there is not a job that operates anywhere near as satisfactorily as on gasoline, a great deal of progress has been made, and—best of all—the big job in handling kerosene efficiently has been impressed on several makers of carbureters as well as on makers of tractors.

With all of this so-called latent automotive energy back of the tractor movement, it is not surprising to find tractor assembly moving much faster than might be expected, and it is not surprising to find in these assembled jobs the last word in modern design and practice. It is a fortunate coincidence that there are so many tested and tried-out units that the assembler can secure, as it should result in that needed speeding up of production which the exigencies of war demand.

There is perhaps one respect in which there is a shortage of tried and tested parts and where the assembler has not that breadth of selection that he has in purchasing engines, magnetos, bearings, radiators, carbureters, etc., and that is in the gearset design. The automobile and truck gearset designer has not been working on the tractor requirements and consequently his jobs are not seen, but their place is largely taken by individual designs developed by the different tractor makers to meet their individual requirements.

Some Gearset Specialists

There are, however, firms that specialize on tractor gearsets, and two companies in particular, Foote and Nuttall, have developed new designs intended to permit the use of live rear axles in conjunction with larger diameter wheels. The Foote gearset permits of using a 60-inch rear wheel mounted direct on the live axle, and the Nuttall design was shown in tractors with 48-inch rear wheels. Neither of these new designs has been tested out, and so the immediate future of the gearset is not a settled point. There is, however, little doubt but that the live axle design will be accomplished in conjunction with a gearset and the necessary wheel diameters for soft-ground use that will give all the reduction needed without undue tooth pressure. The job is not yet done, and tractor gearsets offer an attractive field for design.

Still further, a department that is holding back tractor assembly is the frame design. There is no such thing as a standardized tractor frame. Each frame has been worked out to meet the ideas of the designer. There was only one tractor at the Twin Cities and Kansas City shows that had a heat-treated, pressed-steel frame, and that was the new R. & P. job, the product of the Republic Truck Co. It has a very simple design, with side pieces

Digitized by Google

bottle-necked slightly in front and then dropped to pass below the back axle. The front cross member is an inverted arch affording a trunnion support for the engine and in turn resting on the center of the axle. The new National tractor, not seen at either show, also uses a pressed-steel frame. Nearly a dozen tractor makers admitted that they were waiting for some firm to bring out a good design of pressed-steel frame, and that just as soon as this happens they will drop their rolled channel job, or their cast-steel job or their made-up contraption and take on the pressed-steel design.

Front axles also offer a good field for the axle maker. The time is ripe to bring out some standard designs of axles. The use of roller bearings in the wheels will hasten the standardized axle. Practically a straight forged design, with Elliott or other types of ends, will fill the requirements.

Tractor Classifications

With such fairly satisfactory avenues to secure tested and proven units, it is not surprising that many new tractor firms should be on hand and that they should have quite reliable jobs. There are perhaps ten of such.

The development of the year has not been confined exclusively to the new assemblers, as many of the old-line makers have improved, although there is one class where the design is not in any way associated with automobile or truck practice, where the development is not so pronounced.

The tractor field literally divides itself into two broad classifications, with a third class occupying a middle position between them. Thus one class may be designated as the farm-implement design, the other the automobile design, and between these the middle class.

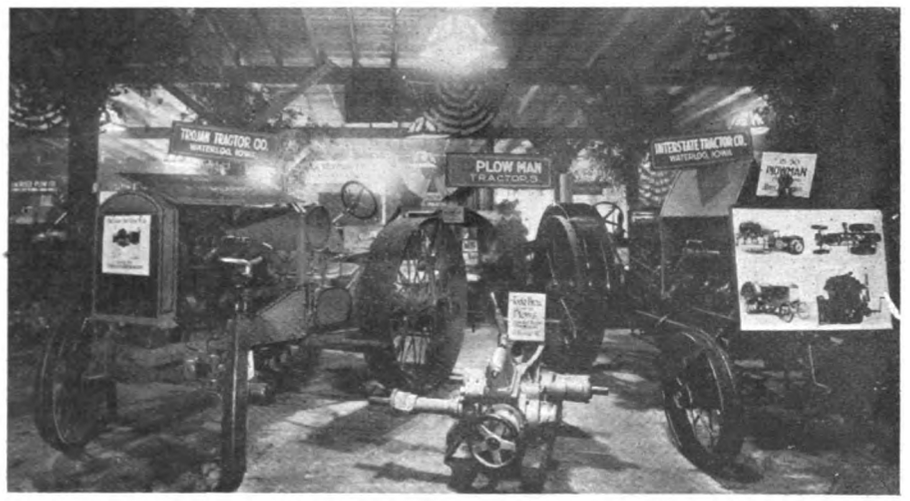
This classification does not mean that firms making farm implements follow the first division; in fact, the opposite is the case with several houses, and some of the farm-implement makers have been leaders in exploiting the automobile design; witness Case, Wallis and Rock Island.

On the other hand, there are the implement makers that have a distinctive tractor design, and these constitute the first group. In this are International Harvester, with its Mogul and Titan models; Avery, Rumely, Hart-Parr, Waterloo Gas Engine Co., Fairbanks, Morse & Co. and some others.

In the automobile classification are such names as Case, Wallis, Ford, Samson, Cleveland, Velie, Bates, Four Drive and several other new names that have come to the front in the last few months. In general this classification adheres to general automobile arrangement with the four-cylinder engine, radiator, gearset and axles in practically the same general layout as in an automobile or truck. They use automobile or truck design of units and aim at the same standard of materials, bearings, weight reduction, etc.

Then comes the intermediate class, including all designs that are in the nature of a compromise between the farm machine idea on the one hand and the automobile idea on the other. In this classification might be placed such firms as Emerson-Brantingham, Twin City in its smaller models, Parrett and some others. They were developed very largely in a machinery atmosphere, but have absorbed very liberally of the best automobile practice, and all have most efficient machines, leaders in their respective fields. They use the four-cylinder engine, but in transmission and chassis details are not quite in the automobile classification.

With the first classification, the agricultural machinery class, the use of the twin engine, or the single-cylinder design, both horizontal, is general. These are generally large-size engines, with cylinder ranging from 6 to 8 in. in bore and with proportionate strokes. They are heavy constructions and bear little if any resemblances to automobile engine design. The transmission systems are proportionately heavy, with many exposed gears and cast gears used in place of forged designs. The use of anti-friction bearings is not general.



Just when these three divisions will come together or in what form is not within the scope of this show report, but it will form one of the most interesting developments of the future. There are in the farm machinery classification those huge designs of tractors that pull ten or a dozen plows, machines which have wide use in the large areas of the West, and there is some speculation whether these machines will continue or some smaller form of automobile design will take their place.

Two Schools of Engineering

The farm machinery or implement classification and the automobile design represent two entirely different schools of engineering, and the rule that will determine the future of each is the law of the survival of the fittest. There is no doubt that there is some feeling between the two classifications. The farm machinery classification had the field by virtue of priority of manufacture, and what the automobile classification has achieved has been obtained by later manufacture.

There are not a few problems in tractor development that are yet remote from a satisfactory solution. One of these is that of weight and another is wheel diameter and necessary gear ratios. There is practically no definite group that is settled on wheel diameter, and the fact that some of the latest designs range in wheel diameters from 42 to 60 in. indicates the variety of thought.

Exponents of high-wheel machines, say 60-in. diameters, do not think that it is possible to perform all farm work with wheels that are much less than this in diameter. They point to the early plowing necessary for oats, where a field must be plowed before all of the wet spots have dried up, and that a large-diameter wheel is necessary for such work. Some others point to the wheel

A corner of the Kansas City tractor show

Digitized by Google

diameter necessary for rice farming. Others point to the still greater need for some form of farming where great moisture of soil is essential. The fact that we have with us creeper types, fashioned after the Holt caterpillar; that we have 42-in. wheels, 48-in. wheels, 56-in. wheels and 60-in. wheels on machines intended for practically the same work is evidence of work yet to be done before the eventual is reached.

The question of wheel diameter and tractive effort and drawbar pull is closely associated with that of weight, and nothing definite exists as to the most desirable weight for a three or four-plow tractor. Scarcely any two engineers agree. They are not entirely settled in their own minds.

One concludes that weight up to a certain point is necessary for traction and another holds a different view. One admits that a small-diameter wheel will pull its load on good soil, but not on sandy or soft soil. What is needed is a good series of official tests in which every tractor will be put through the same series of tests that will embrace different soil conditions. This has never been done as yet. Such tests would answer many of the questions that are being asked regarding the performance of creeper machines in different soil conditions. A few strenuous tests such as the automobile industry had in its early days are needed to-day in the tractor business.

Undoubtedly different designs of tractors will be the eventual solution. It is the history of all industries that at first there is the blanket type of machine that is sold as suitable for every kind of job, but later as the industry develops differentiation sets in and efficiency dictates that it is economically more sound to adapt different designs to different uses.

With the tractor industry we are in that stage where too many makers would like to sell their machines for every kind of soil and would interpret it as a weakness if they admitted that their machine is not suitable for certain localities. This is unfortunate, but it is the price that all developing industries have had to pay for the short-sighted maker.

Differentiation in the tractor industry will be accelerated by good tests, tests which will show efficiency of design, the practical phases of design and the commercial aspects of design. As the motor truck industry developed we watched differentiation take its place. The same was true of the automobile. The same has been taking place with amazing speed in our aviation program. We are witnessing the same in the motorcycle field, and we must not be surprised at it in the tractor field, where we should take no injudicious steps to combat it.

Tractors Show Mechanical Refinement

New Gearsets Permit Use of Large Wheels with Live Axle—Weight Being Reduced

KANSAS CITY, Feb. 16—The newest thing at the Kansas City tractor show was the R. & P. tractor built by Ruggles and Parsons, the moving spirits in the Republic Motor Truck Company. This tractor is perhaps the best exemplification of automobile influence on tractor design and is the first tractor to use a pressed-steel frame, heat treated; it has a special design of Torbensen internal gear drive for tractors, and uses the Italian type of wheel. This tractor represents very close adherence to automobile design in the arrangements of all its parts.

A new tractor, which has not in any sense originated from automobile men, but rather from tractor men, is the Trojan, in which the most important feature is the new Foote gearset, which, with its combined live axle, permits of using 60-in. driving wheels, a greater diameter than has ever been used before with a live axle design. Spring drive in the rear wheels to relieve the gear teeth of shock is used. In working out the job John B. Foote, of the Foote Brothers Gear & Machine Company, has kept tooth pressure low, but has a gearset of considerable weight and employing upward of twenty gears. His reductions are in five stages, the greatest being 16 to 1. A planetary system is used in conjunction with a sliding set, and one bevel reduction at the front end.

The set affords three forward speeds, which in miles per hour approximate 1.5, 2.12 and 4.3. By changing a set of two gears which are outside of the case, but yet enclosed, it is possible to change the entire speed ratios and give a higher ratio of speed, as 2.2, 3 and 6 m.p.h. The cost of an extra set of these two gears is $16, and by this additional investment the farmer has a tractor with a range of six forward speeds.

To change this set of gears calls for removing a plate on the side of the gearbox and not more than 15 minutes' work. An increase in draw-bar pull of 50 per cent is obtained by this arrangement.

The Foote unit is more than a gearbox and rear axle combination and has a forward extending cradle which supports the engine, constituting in reality about seven-eighths of the tractor frame. The front end of the gearbox ends in a bell housing to fit the corresponding end on the crankcase, S. A. E. standards being used.

All gears in the set are .15 to .25 carbon forgings and are heat treated except the ring gear on the differential, which is a semi-steel casting. The Foote company plans to manufacture this gearset in two models, one for three-plow jobs and the other for six-plow jobs.

The Nuttall Gearset

Another new gearset, and one designed for live-axle drive, was exhibited by the Nuttall company, gear makers. It is a combination with the live rear axle and all gears are forged and heat treated and shafts are carried on roller bearings. This set, suitable for a three or four-plow tractor, gives two forward speeds and is claimed to serve with a 52-in. drive wheel and a motor speed of 850 r.p.m. With an engine speed of 900 r.p.m. and 48-in. wheels tractor speeds of 2.5 and 3.5 m.p.h. are given.

This gearset has two gearshafts in front of one paralleling the live axle which is incorporated in the gearbox. At the front end is a bevel reduction from the clutch. The first shaft carries the large bevel and a pair of sliding gears. On the second shaft are two large diameter spurs and the differential. The ends of this shaft carry the small pinions meshing with the large master

Digitized by Google

gears on the live-axle shafts, which are 22 in. in diameter and 2.25 in. face.

The set complete weighs 1300 lbs. and will be in production for Fall delivery. This gearset is used in the Sexton, a new tractor made in Asbury Park, N. J., and in this job 48-in. wheels are used.

There are many other examples of what changes have taken place in the past year, changes which tell in unmistakable words that the tractor is here and the looked-for development is rapidly under way.

Two-Wheel Designs

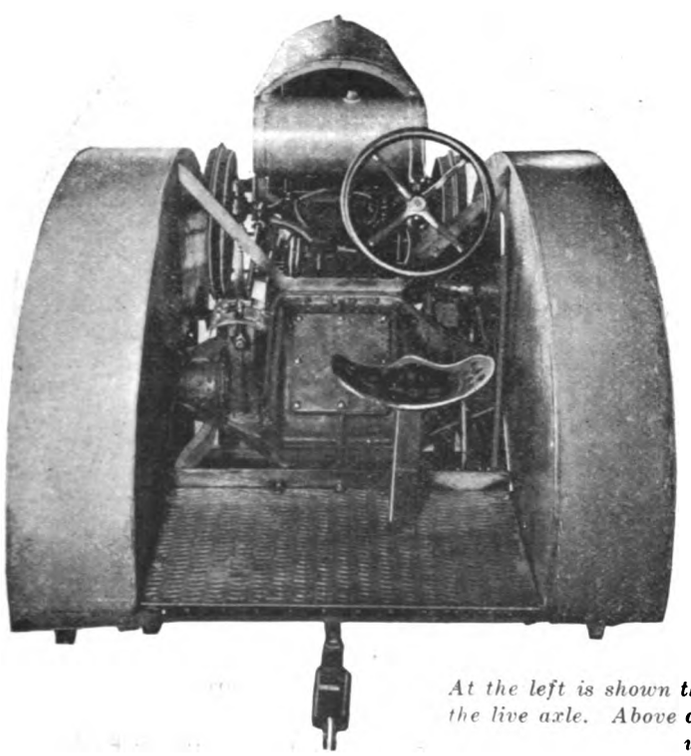
Four two-wheel tractors have been shown this year, the leader being the Moline Universal, which has not been changed in design; the Square Turn, a Chicago design, which uses very large wheels and carries the plows underneath the frame; the Noble, of Kansas City, which uses a Continental block engine carried on a framework swung between the two 60-in. wheels, and the Beeman, which is a miniature cultivator resembling a hand one.

New Creeper Type

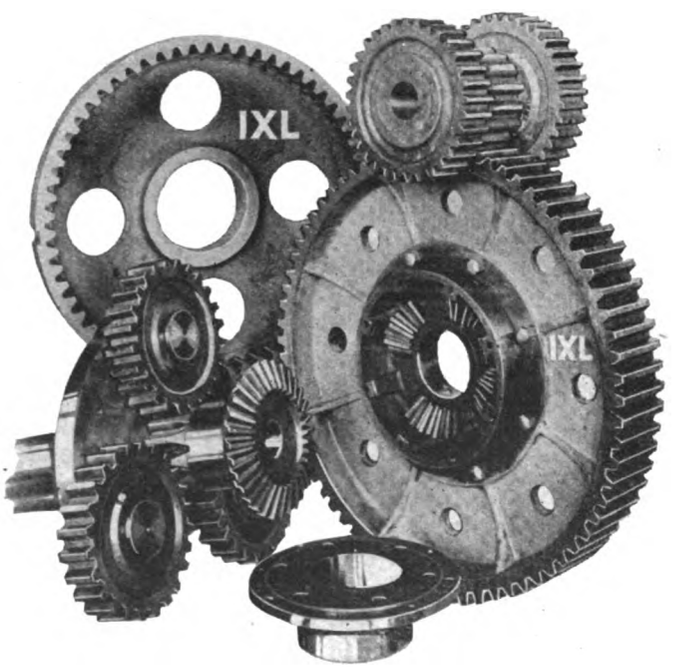
The Belt-Rail, as its name suggests, is a creeper type with two steering wheels in front. This has been developed by the Beltrail Tractor Company, St. Paul, Minn., by the interests that make Crex matting. This concern used 3600 horses on its farms where the special grass for making this matting grew. It required a machine that could operate well on soft ground to do the work, and the creeper type is the result. The design has been well worked out, using a four-cylinder Waukesha engine, a two-speed transmission, with Hyatt bearings, worm-and-segment steering, Bennett air cleaner, etc.

Features of Some of the New Tractors

THE J. T. tractor, the first model of which was brought out two weeks ago, is a wheel-less creeper design with a long creeper on each side having 57 x 8 in. ground contact. Each creeper rides on a train of idler pulleys and is driven from a large rear gear that in turn receives its power through an internal gear drive entirely inclosed. Steeeing is by use of internal brakes acting on the differential, one brake on each half of the differential.



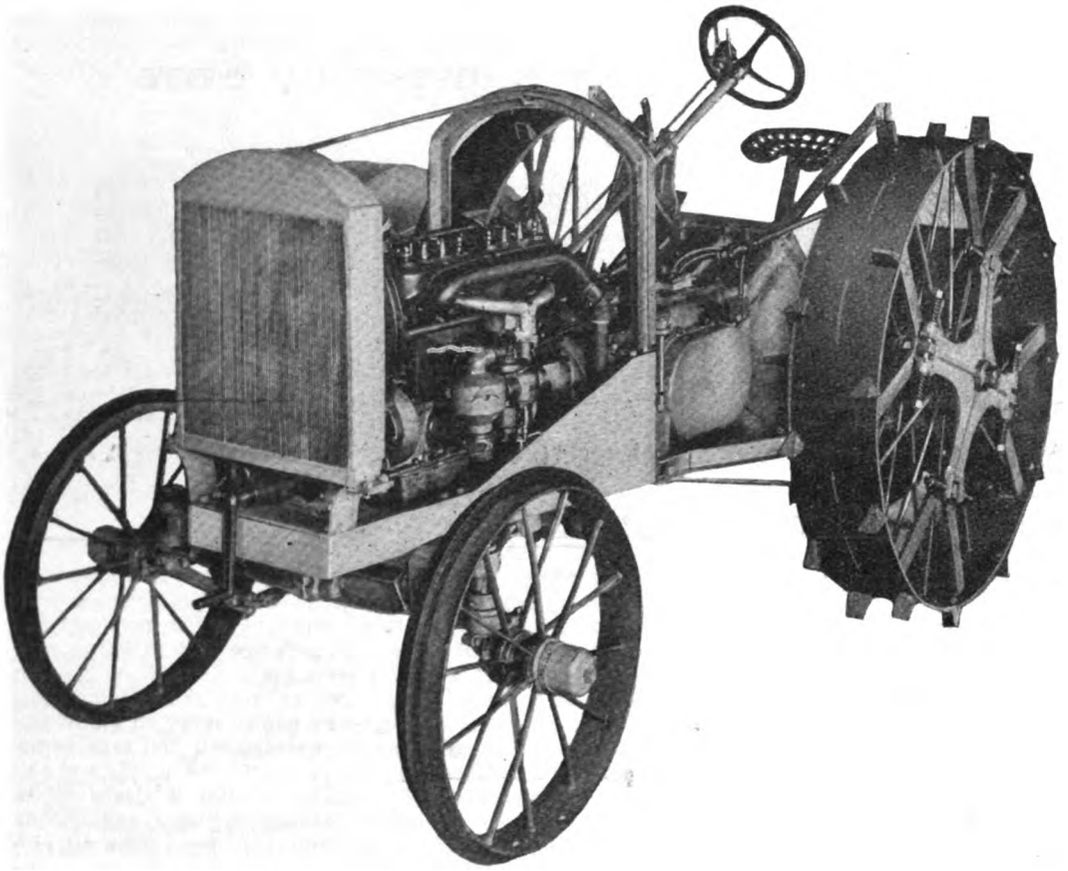
The four-cylinder, block, valve-in-head Erd engine burns kerosene, the J. T. carbureter working in conjunction with an exhaust jacketed manifold. With the engine at 800 r.p.m. the three forward speeds are 1.25, 2.5 and 5 m.p.h. The gearset is made by the Detroit Gear & Machine Co. and the jackshaft by the American Ball Bearing Co.



The J. T. Tractor Co., Cleveland, Ohio, occupies a three-story plant and hopes to assemble 5 machines per day in 6 months. George P. Comey is president, J. J. Tracy, chief engineer, H. L. Lance, general manager and C. E. Grove, salesmanager. The company has not yet built up its distributing organization.

Fair-Mor is the new tractor name for Fairbanks. Morse & Co. the large builders of railroad supplies, including a line of gasoline engine trucks for section work, which have been marketed for many years. The Fair-Mor tractors have been made for several years, but largely for export, and have only now been introduced into the great Mississippi farming belt. There are two models, both of which burn kerosene and use twin-cylinder engines of slow-speed design (400 to 600 r.p.m.).

The larger model, a 12-25 job for three plows, is built as an imitation of a steam traction engine, with the cellular radiator as the body, the twin-cylinder engine lying on top of the rear end of the radiator and the gearset and fuel tank forming the firebox. The rear wheels are 56 by 18 in. and the engine cylinders 6.5 by 8 in. The radiator is closed at its front end and the air enters through the rear and travels forward, escaping through the funnel on top. This air circulation is maintained by the exhaust, which escapes at the front of the radiator and also in the base of the funnel, thus creating an air draft.



Kerosene is pumped by plunger pump into a globular chamber of about carbureter size at the front end of the engine, or close to the cylinder heads. This globe is heated by the exhaust, and as the kerosene is sprayed into it hot air also enters to take up the kerosene. On its way to the cylinders a current of cold air is added to increase the power. A butterfly throttle controls the flow of mixture. The radiator capacity is 100 gal. and the total weight is given as approximating 5500 lb.

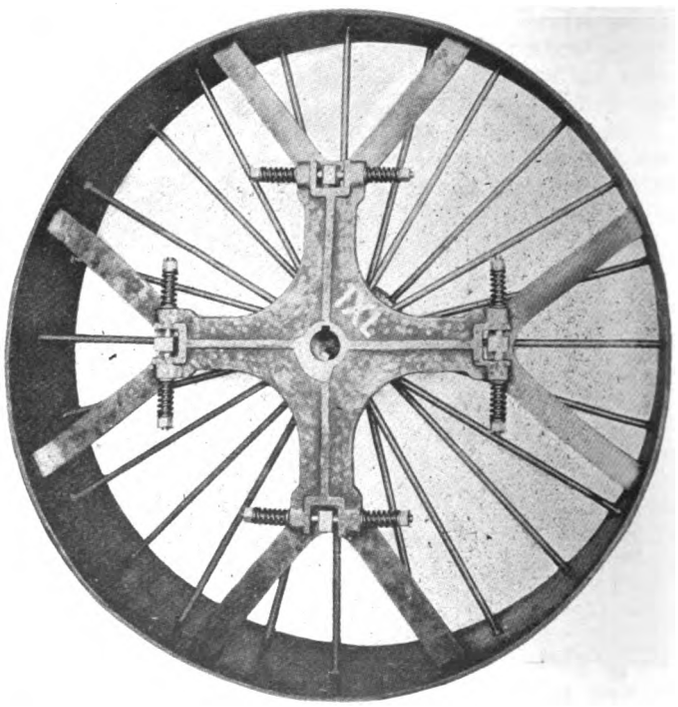
At the left is shown the rear of the Trojan tractor and the housing for the live axle. Above are the component parts of the Foote gearset with which the tractor is equipped.

Digitized by Google

The Trojan tractor is one of the first to have very large drive wheels used in conjunction with a live axle. This is made possible by the use of the new Foote transmission, component parts of which are illustrated on the preceding page

The smaller Fair-Mor model is a conventional design but much the same in principle, using a twin-cylinder 6 by 7 in. engine, which runs at 600 r.p.m. Its rating is 10-20 and, like its larger brother, it has large drive wheels with inclosed drive. It has direct pulley drive for belt work.

Coleman Worm Drive

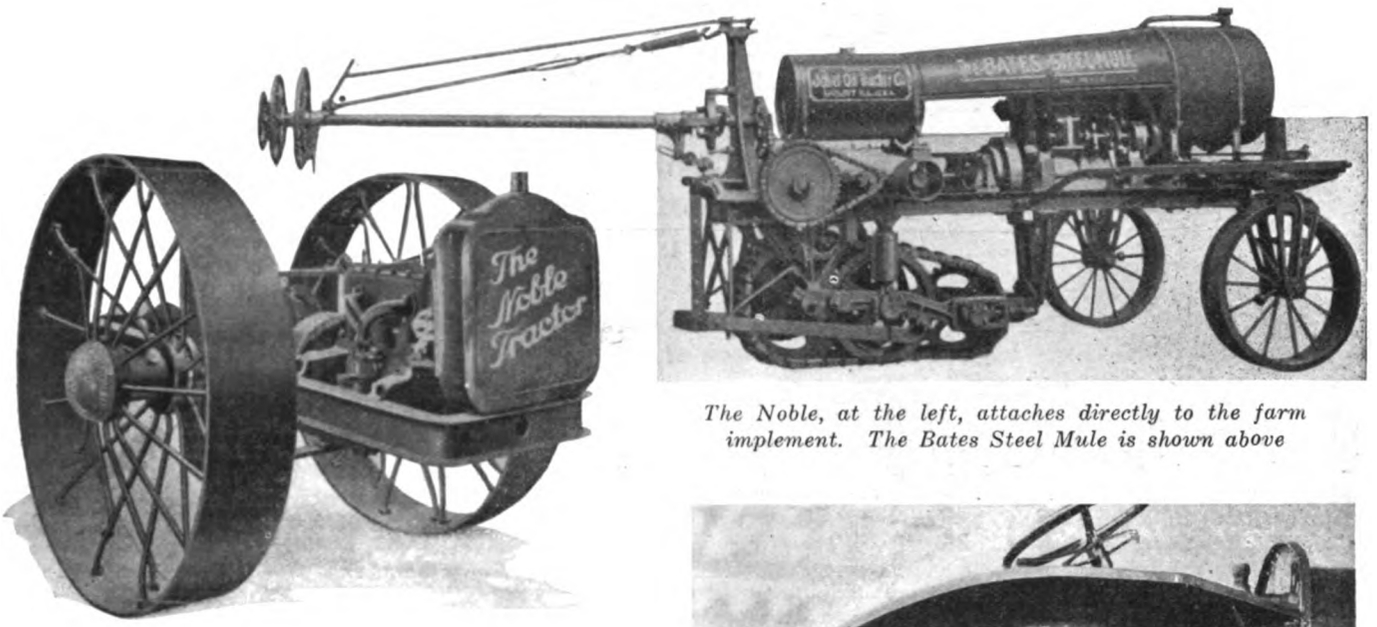


One of the few worm drive tractors aside from the Fordson, the new name for the job made by Henry Ford and his son Edsel, is the Coleman, of which perhaps thirty have been made to date, although development work was started several years ago and manufacture begun a year ago. The worm mounted on top of the wheel in the rear axle is used in connection with a two-speed gearset. The worm and wheel give a reduction of fifty to one. The wheel is 26 in. in diameter, and the worm 4 in. in diameter, six teeth of the wheel being constantly in mesh with the worm. The worm is mounted on Timken bearings and has special provision for lubrication. The live rear axle is carried on Hyatts, as is the differential.

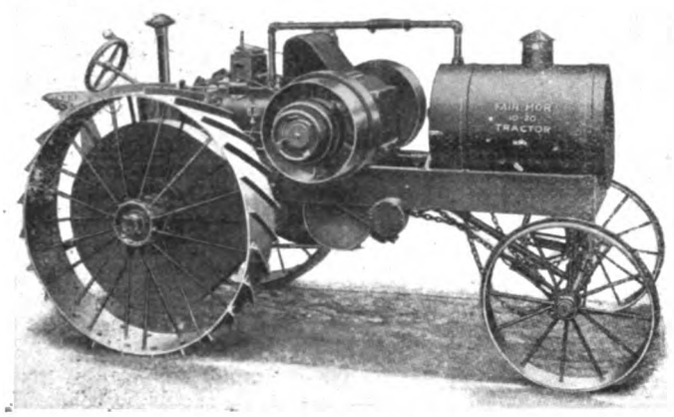
The engne is a four-cylinder block Erd. Forged gears are employed in the gearset. The rear wheels are relatively small, 42 in. in diameter on the small model and 46 in. in diameter on a larger model.

Plano Tractor

The Plano Tractor Co., Plano, Ill., began tractor development 2 years ago and have just started production on a new four-wheel design using a 4¼ by 5½ Buda engine, which drives through a Plano design of gearset to the rear drive wheels, which are 42 by 12 in. There is a total reduction between the engine and rear wheels of 49 to 1. The front wheels are also large diameter and having the frame very narrow at the front gives the job good maneuvering ability. The frame is cast steel and almost yoke shaped with the narrow end or stem of the yoke in front. The weight distribution is such that 30 per cent is over the front wheels and 70 over the rear. The drive wheels carry large manganese steel gears which are intended to be run without lubrication and are guaranteed for 2 years. In the two-speed gearset cast gears are used and shafts are carried on Hyatts. The radiator is back of the engine and just to the left of the operator's seat.



Use is made of a special water air filter made by the company. It is inclosed in a rectangular box which is two-thirds filled with water and is kept at this level from the radiator system. The box is divided horizontally into upper and lower halves by a metal plate. Air enters the lower half and in passing through the water is led through a devious course by a series of vertical baffle plates attached alternatively to the top and the bottom of the compartments. The double-bowl Kingston carbureter consumes kerosene.



The Trojan tractor uses 60-in. wheels driven by a live axle, the driving strain being softened by a spring arrangement shown in this view

Effects of Low Temperatures on Starting*

Reduction of Battery Capacity and Terminal Voltage with a Decrease in Temperature—Congealing of Oil and Decrease in Efficiency of Starters at Low Speeds

By O. W. A. Oetting
Engineer of the Willard Storage Battery Co.

THE starting troubles encountered because of cold weather conditions such as we have experienced during the past three months are most exasperating to the car user, but in the majority of cases are avoidable if all the effects of low temperatures have been anticipated by the automobile designer. The proper application of the electric starter and storage battery for use on passenger cars, motor trucks and tractors presents problems to the engineer which if properly solved will prevent some of the troubles which frequently have occurred in the past.

No apparatus is required to operate under such a variety of conditions as the automotive engine and its accessories. The range of temperature from the heat of summer to the freezing cold of winter is one of the conditions that must be appreciated in making the proper application of the storage battery for this service. The storage battery can be made that will operate in a satisfactory manner under these extreme conditions, but engineers must take into consideration certain facts. In cold weather the capacity and the voltage of a battery are less than they are at normal temperatures. Likewise, it is much more difficult to start an engine because of the effects of these low temperatures on the lubrication and also the carburization of the fuel. In addition to these facts, we find that the efficiencies of the electric starting motors are considerably lower at the low weather conditions. In determining the size of the storage battery the power required to start the engine under these cold weather conditions must be used as a basis.

Considerable data on cold weather starting have been secured. It is the purpose of this paper, first, to give a short résumé of these tests and, second, to summarize these results so as to predict, if possible, the size of storage battery that is required for starting any engine, giving the approximate ampere-hour battery capacity in terms of the piston displacement of the engine.

*Paper read before the Cleveland Section of the S. A. E. on Feb. 15.

Battery Sizes

Heretofore, not enough attention was given to the size of storage battery that was required on a car and almost invariably a smaller size of battery was used where a larger battery would have given better service under all conditions. This haphazard application of the battery shows great inconsistencies when a plot is made of the battery sizes against the engine displacements, as shown in Fig. 1. The data for this plot are taken from a list of all the 1917 passenger cars and are no doubt representative of present day practice. It can be seen that the 80 amp.-hr. battery is used on cars having piston displacements from 95 to 425 cu. in. On the other hand, the 100 amp.-hr. battery is used on cars with displacements ranging from 170 to 425 cu. in. Undoubtedly, cars with piston displacements over 200 cu. in. should be equipped with a larger battery than 80 amp.-hr. and those with displacements greater than 250 cu. in. should have a battery larger than 100 amp.-hr. The plot in Fig. 1 is correct only if the gear ratios between the starter and engine are the

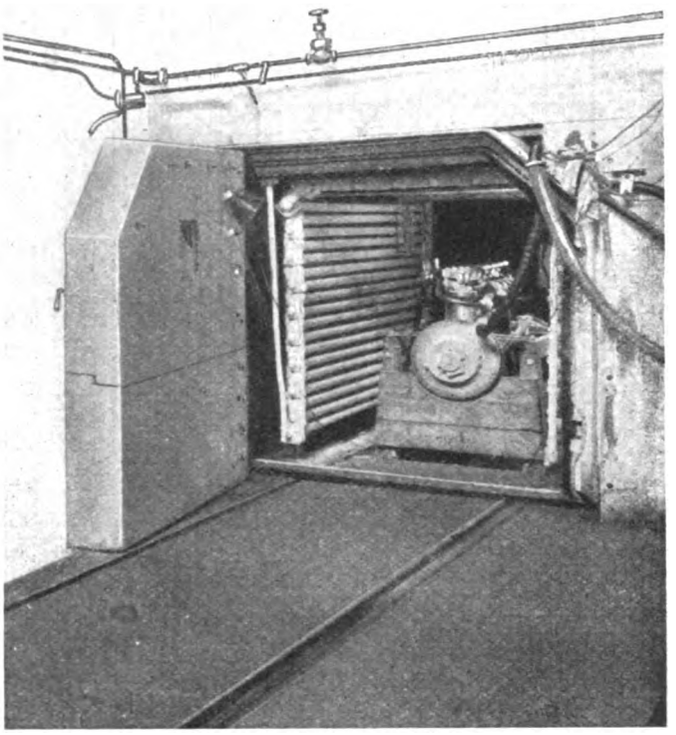

Fig. 4—A refrigerating machine and cooling chamber for testing engine with starter and battery at low temperatures

same. On the present day cars this is practically so, as the majority of the cars are equipped with the single gear reduction with ratios approximately equal to 10 to 1.

With the purpose in mind of securing some factor that will determine definitely the size of battery required for every size car, engines were tested with their starting motors and batteries in a large refrigerator to find the actual power required to turn over the engine at various temperatures. The exact minimum of temperature at which the engine should start promptly is, of course, debatable.

A temperature of 10 deg. Fahr. has been found to be a good basis for cold weather testing. Fig. 2 shows a chart which was compiled from data on temperatures obtained by the U. S. Weather Bureau. The figures within the circles are averages of the temperatures observed for a long series of years at various stations throughout the United States during the winter months. The small figures beside the circles give the absolute minimum temperatures at the same localities during this period of time. It will be noted from this chart that only three States have an average temperature lower than 10 deg. Fahr. If then we take 10 deg. Fahr. as a cold weather standard and design the engine and all the automobile accessories to operate properly at this temperature, little trouble should be experienced during the winter months and satisfactory service from the apparatus will be assured.

One of the effects of low temperature on a storage battery is to lower the terminal voltage, especially at the high rates of discharge that are required by the starting motor. Fig. 3 shows the "five second voltage" curves of a 100 amp.-hr. battery at 80 deg. Fahr. and at 10 deg. Fahr. By the term "five second voltage" is meant the voltage that a battery will give at the end of five seconds at a certain discharge rate of current. In other words, the battery shown in Fig. 3 will have a voltage of 4.82 after five seconds' discharge at 400 amp. at a temperature of 80 deg. Fahr. It will be seen from this curve that this battery would not be suitable for an engine with a starter requiring 300 amp. at 4.5 volts when the temperature was 10 deg. Fahr. or lower. Curves such as these should be used in all starting motor designs.

Fig. 4 illustrates a refrigerating machine and cooling chamber used for testing an automotive engine with its

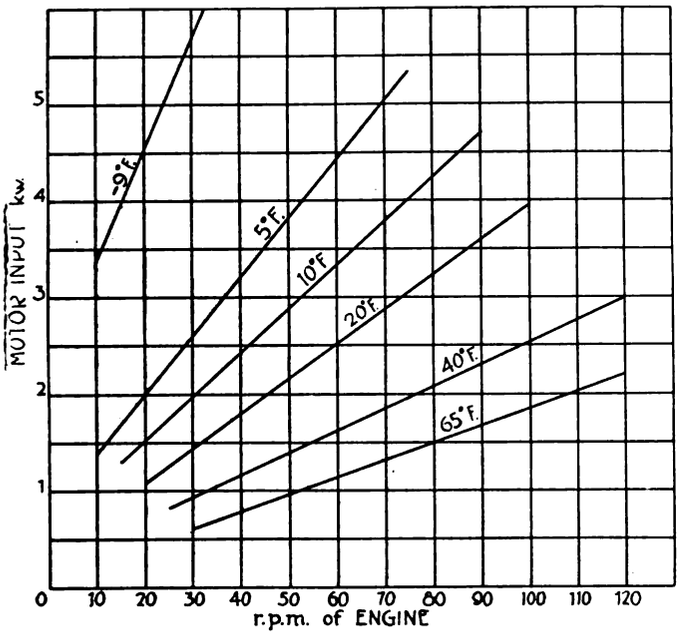

Fig. 7—Power required at various temperatures by starting motor on an eight-cylinder engine of 332 cu. in. displacement

starter and battery at low temperatures. This refrigerator can be cooled to a temperature as low as —30 deg. Fahr. The engine to be tested is placed within this box and wires are brought out from the battery and starter to read the electrical input required to start the engine at low temperatures. A thermometer and some anti-freeze solution are placed in the cooling chamber of the engine and the temperatures can be observed from the outside of the box by means of a small observation door in the main door of the box. The revolutions of the engine are obtained by means of an electrical contactor scheme which rings a bell outside of the refrigerator. After the starting data are obtained at the normal room temperature, the box is slowly cooled to any desired temperature and the starting characteristics of the engine at this temperature are then observed.

Table I gives the results of a test on a certain four cylinder engine having a piston displacement of 171 cu. in. The values in this table give the power that is required to break away the engine and then roll it at a certain speed and temperature. These results are plotted in Fig. 5, the curves showing the average power used for the breakaway and roll of the engine at various engine speeds and temperatures.

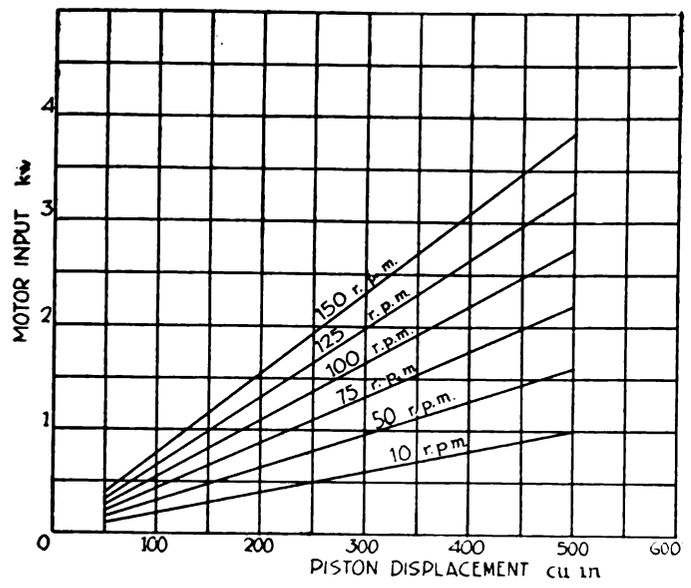

Fig. 9—Approximate power required to break away and turn over various sizes of engines at normal temperatures

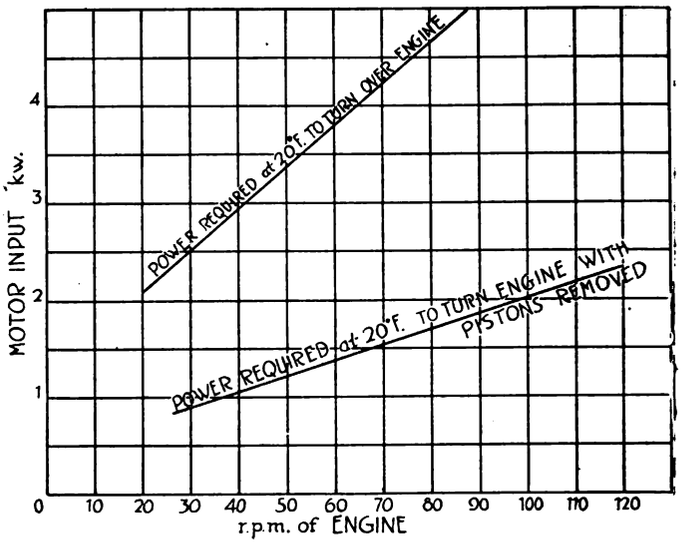

Fig. 8—Test showing comparison of power required to turn a six-cylinder engine of 303 cu. in. displacement without pistons and connecting-rods

The engine in this test had one cylinder which required about 50 amp. more than any one of the other three cylinders during the roll of the crankshaft. This, however, is the service that is demanded of a new storage battery on a car, as the engines often are not "run in" sufficiently before shipment is made by the car manufacturer. A 90 amp.-hr. battery at a temperature of 10 deg. Fahr. turned over this engine at a temperature of 8 deg. Fahr. at 30 revolutions per minute.

A considerable variation in the power demanded from the storage battery is caused by a poor design and application of the starting motor. Fig. 6 shows curves of power used by four different types of starters on a certain six cylinder engine. The light weight starter D requires about one kilowatt of power more than the starter A, in which the proportions of the various parts were more liberal. These curves indicate that the tendency to a lighter and cheaper starter will result in the necessity of the use of a larger storage battery. The automobile engineer must therefore decide where a compromise between the battery and starter will give the best economy and service. In the case of the engine in question, starter B was used. At 30 deg. Fahr. this starter with a 120 amp.-hr. battery rolled the engine at a speed of 30 revolutions per minute.

In Fig. 7 are shown curves from an eight cylinder engine having a displacement of 332 cu. in. This engine was made

by a well known engine manufacturer and the fittings of all the parts were well made. The results were therefore lower in proportion to the size of engine than the results obtained with some of the other engines tested at these low temperatures.

A bad feature in the design of bearings was brought out in one of the low temperature tests during these investigations. The bearing caps on one of the engines tested were made of aluminum, and at the low temperature these bearings were found to be shrunk tight on the shaft, due to the difference in the coefficients of expansion of the two metals. During the test it was observed that this engine required an unusually large amount of power to start it. The pistons, connecting rods and camshaft drive were therefore removed and the power required to turn the crankshaft and flywheel was found to be considerable. Fig. 8 shows that the power required for this latter condition was about one-third of the total power required to break-away and turn the engine without the pistons removed. At 6 deg. Fahr. with the pistons removed and 2.8 kw. supplied to the starter it was impossible to pry the engine loose with a 10-in. lever in the teeth of the flywheel. This test gave values that were about 100 per cent higher than the average of all the engines tested under these cold weather conditions.

Summary of Tests

Other engines in addition to those mentioned in the foregoing were tested, and all the results were averaged so as to determine, if possible, the power that is required to start any size of engine. It was found that it is hardly possible to lay down a hard and fast rule for this purpose, but a close approximation is possible. Average results on the engines tested differed for various reasons, such as variation in compression, difference in the viscosity of the lubricating oils at low temperatures, variations in the refinement of the engine fittings, and the difference in the design of the starting motors.

Figs. 9 and 10 give a summary of the power required to start the various sizes of engines at normal temperatures and 10 deg. Fahr. respectively. In these curves motor input is plotted against the piston displacement of the engine. It would have been more logical, perhaps, to have plotted the power against the area of the rubbing surface of the piston walls, but this relation did not average the points any better than the one shown in the curve. As a matter of convenience, then, the co-ordinates used in the curves were chosen.

Having ascertained the power that is required to start the engine, only one more step is necessary to determine the approximate size of storage battery that is needed for this service. Figs. 11 and 12 show the "five second voltage" curves of various sizes of batteries at 80 deg. Fahr. and 100 deg. Fahr. respectively. The power that is available for five seconds from any of these batteries is the product of the volts and the amperes at any of the intersections of these co-ordinates. The dotted lines on these curves represent the power that can be obtained from any of these batteries for a period of five seconds. From these curves it is possible to determine the amount of power that a given size of battery will deliver when discharged at a certain rate of current or else discharged at some predetermined terminal voltage.

From these curves and the results of the engine tests it is possible to estimate the cranking speed of any size of engine with a given battery at a temperature of 10 deg. Fahr. when it is equipped with a 6 volt starter with a gear ratio approximately equal to 10 to 1. This has been done in the curves shown in Fig. 13. This figure shows the average results of the engine speeds at 10 deg. Fahr. with the size storage battery plotted against the size of the engine. Table II gives the minimum size of battery that is satisfactory for use on a 6 volt starting system when the gear ratio is approximately equal to 10 to 1. The basis for this data is the power that is required by the starter at 10 deg. Fahr. as shown in Fig. 10 and also that power which is available at this temperature from the battery when the rate of discharge is about four times its twenty minute rate. No allowance was made for the drop in the leads or starting switch between the starter and the storage battery. This drop varies in the different applications from 0.2 to 0.5 volts and should be made as small as possible, so as to utilize the maximum power that is available from the battery.

The values given in Table II have been indicated in Fig. 13 by the dotted lines. It will be noted that the battery sizes given in the table lie between the cranking speeds of 20 and 50 revolutions per minute at 10 deg. Fahr. There are diverse opinions in regard to the minimum speed for successful starting, a condition which necessarily depends not only on the electrical system but also on the ignition, lubrication and carburization of the fuel. The battery capacities recommended in Table II are the *minimum* sizes that will give satisfactory starting service at 10 deg. Fahr. in accordance with the average results of all these cold temperature investigations. Some engines may be found that will require larger batteries than these sizes, and in such cases greater capacities should undoubtedly be used.

Table II—Starting Battery

Capacity required with 6 volt system and starter gear ratio of about 10 to 1.

Cubic Inches Displacement	Ampere-Hours
Up to 125	70
125 to 200	85
200 to 250	100
250 to 300	120
300 to 350	140
350 to 400	160
400 to 475	180
475 to 600	205

For starting systems of higher voltage or gear ratios greater than 10 to 1, the battery size can be reduced proportionally.

Digitized by Google

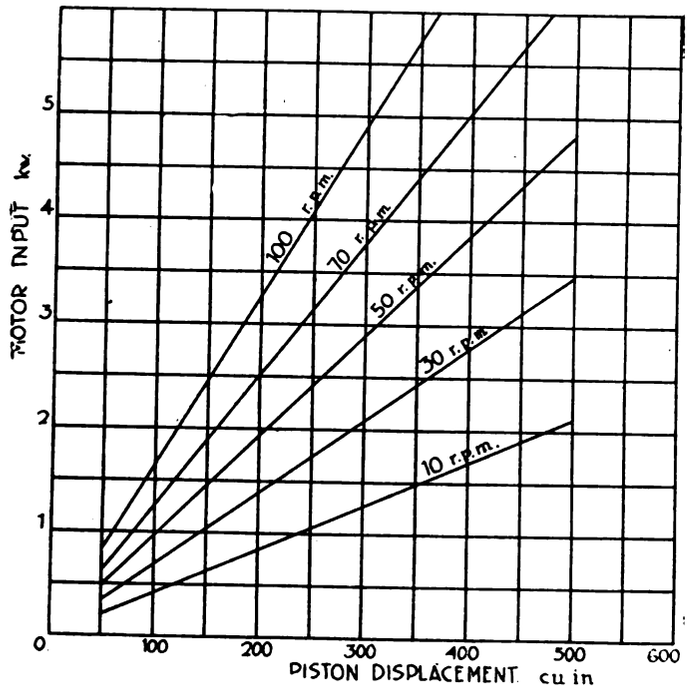

Fig. 13—Minimum battery sizes satisfactory for starting service for 6-volt starting with gear ratio about 10 to 1

One of the features that was brought out very forcibly in the low temperature tests was the effect of the cold on the viscosity of the lubricating oils. As the temperature decreases, the viscosity increases and causes a much greater resistance to turning. One certain grade of oil became a solid mass at these low temperatures. A medium grade of oil in another test was found to have the consistency of extra heavy oil when cooled at 10 deg. Fahr. Therefore, a light or medium grade of oil of a quality that will not lose its lubricating properties at 10 deg. Fahr. or hinder the successful operation of the starting system should be used on cars during the winter months.

Another of the features noted in these investigations, viz., the effect of low temperatures on the ignition system, showed clearly one of the reasons for the adoption of battery ignition in place of magneto ignition. At the low cranking speeds encountered under these cold weather conditions, the cranking speed was seldom rapid enough to fire the fuel in the cylinders when the magneto was used. However, when a battery of sufficient capacity is used to turn over the engine successfully, the battery voltage will always be high enough to fire the engine equipped with a well designed battery ignition system.

The grade of fuel and also its carburization have a great influence on successful starting at low temperatures. The installation of a good electrical system will be utterly negative in results, if the grade of fuel or poor carburization keeps the engine from firing. If the electrical system turns over a cold engine at some reasonably high speed, it should be unnecessary for the car user to be put to the inconvenience of heating the carbureter and manifold of the engine to cause the ignition of the fuel.

Conclusions

1. The size of a storage battery for starter service is determined by the power required to start and roll an engine at some reasonably low temperature (10 deg. Fahr.) at a sufficient speed to cause ignition.

2. Starting troubles may be due to various causes, viz., lack of battery capacity, improper application or insufficient size of starter, viscosity of lubricant at low temperatures, faulty ignition, poor carburetion, or an inferior grade of fuel.

3. A good design of engine and its accessories should take into consideration all of the causes and provide for satisfactory starting at a temperature no higher than 10 deg. Fahr.

4. At 10 deg. Fahr. the available battery capacity is approximately 50 per cent of the normal capacity and the voltage at this temperature also is reduced to a considerable degree.

5. At 10 deg. Fahr. the efficiencies of the starting motors vary between 10 per cent and 40 per cent for the low cranking speeds encountered at these low temperatures. A design of motor should be used which gives better starting torques and higher efficiencies at these low speeds, even if it is necessary to sacrifice some of the normal temperature cranking speed.

Better Starting Characteristics

6. A convenient double reduction gearing between the starter and the engine flywheel can be made that will give better starting characteristics under cold weather conditions than a single gear reduction.

7. A good quality of lubricating oil and a good grade of fuel are requisites for satisfactory starting.

8. As there is a wide divergence in the design and manufacture of the various automotive engines, each design of engine should be tested separately to determine the power that is required to start it under cold weather conditions. In the absence of such data, the approximations derived in this paper should be useful.

Table I

Motor Volts		Amperes		Watts		Speed	Temperature

Figures in columns headed "Break" are the instantaneous readings taken the moment the circuit closed.
Figures in columns headed "Roll" are the average readings taken while the motor was rolling.

Hubbell Toggle Switches

A LINE of switches for automobile work is being manufactured by Harvey Hubbell, Inc., Bridgeport, Conn. One of the switches made is a single pole toggle type. It is adapted for controlling light circuits. By pushing the handle up and down the lights are turned on and off respectively. This switch has a maximum load capacity of 50 watts.

For operating electric horns the concern manufactures a momentary contact switch. When the handle is pushed up the circuit is closed, and when the pressure is removed the toggle is released and the circuit opens. The two switches thus far described are designed for flush mounting on the dashboard or instrument board, and the handle, of course, projects to the rear of the instrument board. The firm also manufactures a switch with a recessed plate in which the handle projects only very slightly from the plate and cannot catch in the clothing of the occupants.

A lock switch is also made, for use either in lighting or ignition circuits. A special two tone horn switch gives two contacts and permits of producing either a low or a loud tone by means of the same horn. When the handle is pushed into the perpendicular position one of the circuits is closed, and when it is pushed further this circuit is broken and the other circuit closed.

The switches are furnished either as single switches or in side-by-side or tandem gangs up to four. The standard finishes are nickel and black.

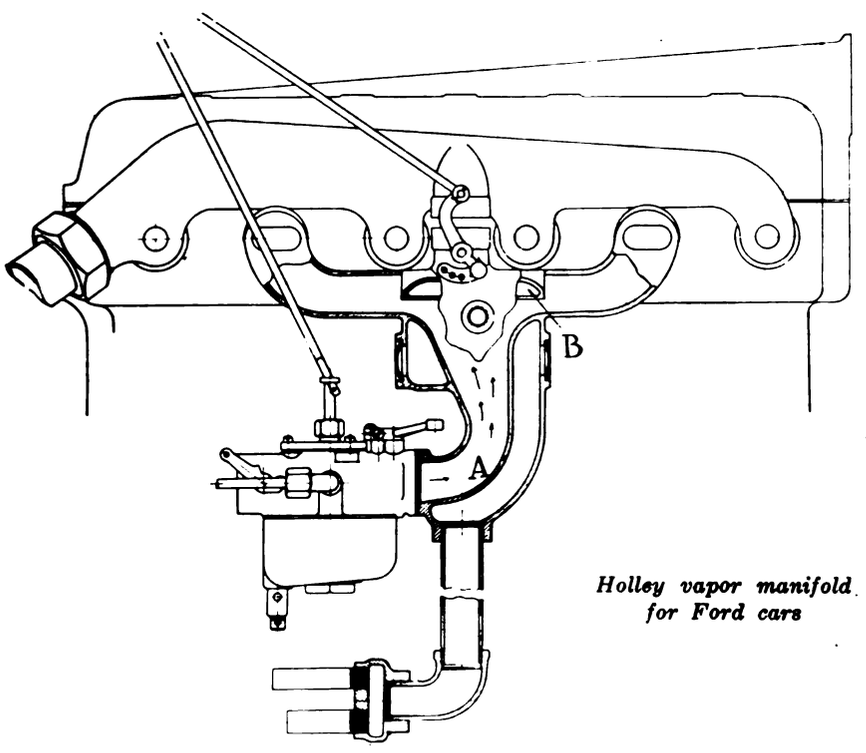
Holley Heavy Fuel Devices

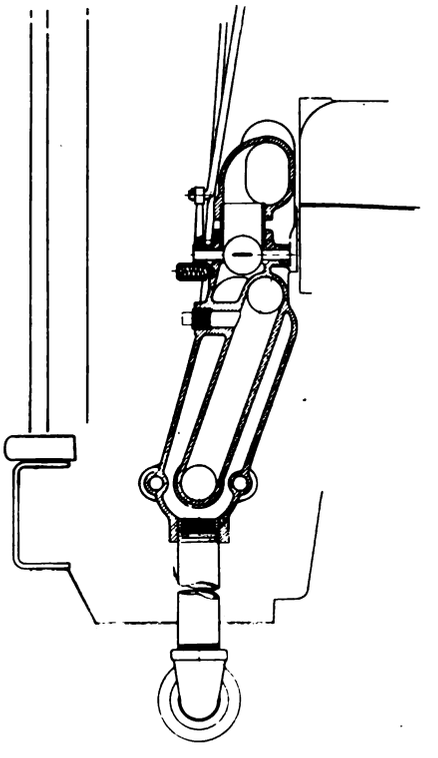
Kerosene Carbureter Applicable to Any Car and Vapor Manifold for Ford Cars to Be Manufactured by New Concern

THE Holley Kerosene Carbureter Co., which took over the Holley kerosene carbureter and the Holley vapor manifold for Ford cars from the Holley Bros. Co., is now in production on these two specialties and is placing them on the market. The Holley gasoline Ford carbureter has been sold, together with the facilities for manufacturing it, to the Ford Motor Co.

The Holley kerosene carbureter, universal type, is an adaptation of the Holley kerosene vaporizer which was described in AUTOMOTIVE INDUSTRIES May 3, 1917, page 870. The type then described was intended for Ford Model T cars and was also adapted for the tractor manufactured by Henry Ford & Son. The present model can be adapted to any type of engine; it is sold to the manufacturer directly and can be installed by making simple changes in the manifold castings to include the heating coil which is a part of the Holley system. The device is designed to use any hydrocarbon fuel with a final boiling point below 600 deg. Fahr. It starts with gasoline and after a short warming-up period the feed is switched to the heavy fuel for running. There are two float chambers to take care of the starting and running fuels.

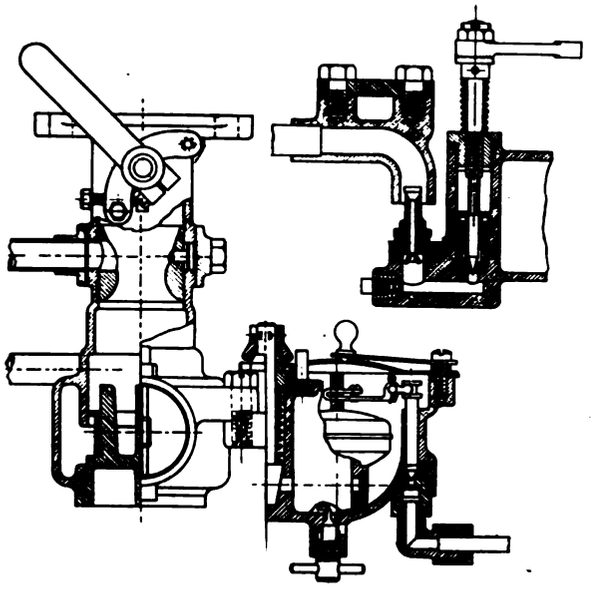


Holley kerosene carbureter complete with vaporizing tube



Principle of the Device

The principle upon which the device operates, as described in the previous issue of AUTOMOTIVE INDUSTRIES, is to first provide a primary mixture by means of a needle valve and a very small aspirating jet, which gives a mixture that is too rich for combustion. This rich mixture of atomized fuel and air is carried through a coil tube of very thin wall thickness exposed to the exhaust gases directly in the exhaust manifold. The temperature in the tube reaches 500 deg. Fahr. From this coil the rich mixture is led directly to a mixing chamber where additional air enters, diluting the mixture to make it combustible. The opening of the air in the mixing chamber is governed by the suction of the motor and by the opening of the throttle valve. To install this device on any engine it is necessary to arrange the manifold casting so as to inclose the vaporizing coil. There is also a device with a bypass which controls the amount of exhaust heat passing the vaporizing coil.



The application of the unit depends upon the design of the engine. The average gasoline powerplant should have the compression reduced to avoid overheating and consequent pounding, but the amount of the reduction is a matter of experiment and depends on the efficiency of the cooling system. Cooling defects, which are passed by unnoticed with gasoline fuel, come into prominence when kerosene is used, and are signalized by preignition and consequent pounding. It is possible to maintain the high compression by the introduction of water in the form of steam into the intake mani-

Holley vapor manifold for Ford cars

Assembly drawings showing construction of Holley kerosene carbureter

fold, and this can be done by locating the water injection pipe near the exhaust manifold and using the heat therefrom.

There are also some details that must be taken care of in an installation. A small auxiliary tank must be provided to hold gasoline for starting, while a larger tank should be arranged for the main supply of kerosene fuel. The shifter valve for changing the operation from gasoline to kerosene should be conveniently connected to the dash or control board so that as soon as the motor becomes warm, an immediate shiftover can be made. A primer located in the manifold, just above the carbureter side, aids in cold weather starting.

The accompanying sectional view shows a heated manifold adapted for Ford cars. This has been put on the market by the Holley Kerosene Carbureter Co. and is intended to completely vaporize gasoline by applying heat at the proper point. As will be noted from the arrows, the exhaust gases pass down, striking a hotspot at the top of the internal intake passage. The exhaust gases flow along this intake passage and finally pass out at the bottom. The heavy particles of fuel, after leaving the carbureter, strike against the wall at the point *A* and there are broken up by the heat from the exhaust gases. Should any of the particles not be broken up at this point they will be vaporized when they strike the hotspot at *B*, as this is directly in contact with the exhaust gases close to the cylinder.

It will be noted that the heavy globules are subjected to a rising temperature, starting at the point *A* with a lesser degree of heat and finishing at *B* with a maximum. A control valve is fitted regulating the amount of heat passing the intake manifold.

Typical installation of Holley kerosene carbureter

Importance of Aircraft Standardization

THOSE who have followed events related to the war will have noticed repeated changes in the organization of the British aerial service. Evidently the aerial fighting forces of our ally have not gained strength as rapidly as was expected, and one of the reasons therefor is the failure to fix upon a limited number of approved types of engines and planes and turn these out in the greatest possible numbers. Commenting on the situation, *Engineering* says:

Changes in Air Force Organizations

Events have been moving rapidly of late. They have provoked a crisis in the demand for men, which emphasizes the urgency of the right utilization of woman-power. The Air Council that has been formed to co-ordinate the needs of the air services has transferred the control of production to the Ministry of Munitions. This week it is announced that the French Air Board came silently into being some three weeks ago. Its head is the Minister for Armaments, and it was engaged nightly for the first fortnight in speeding up the construction of machines, in addition to reorganizing the service. Our American allies . . . have attacked the problem from the outset with the closest possible standardization and the fewest possible types.

The actual complexity and comparative novelty of an aero-engine and its accessories make the selection of designs more dependent for the time being than other classes of constructions on ascertained practice, just as the multiplicity of its parts makes an exceptional call for the use of the best methods of manufacture. A great volume of practice is already available in the experience of those who were concerned in making internal-combustion engines long before a practice of aviation had been created. It is not a complete aero-engine practice; but it is the basis of the aero-engine practice or practices developed during the war, and the best available body of information for criticizing and co-ordinating the construction of aero-engines.

Selection of Designs

A safe decision in the selection of aero-engine designs cannot be made without taking account of the older practice; and now, when the works in which these engines and their accessories and spares are made must be regarded as a single establishment working for a single air service, the smallest possible number of designs must be selected for manufacture if the maximum output is to be attained. The Production Department that now serves the Air Council in the Ministry of Munitions should surely be able to realize for itself that this selection of designs is necessary. It must also know that a single policy cannot be defined with the prospect either of yielding the best result or of commanding the widest confidence unless it has been formulated or approved in the light of the best available knowledge of internal-combustion engine practice; and it should not need the interposition of another department to persuade it that this indispensable condition cannot be assured unless the material to be considered has been weighed by some man or small body of men having the necessary familiarity with this practice.

British Now Have Over 40 Types

At present the service is far from enjoying the benefit of any such selection. We are credibly informed that over 40 different types of aero-engines are now being manufactured in this country, and about as many firms engaged in their manufacture. The labor absorbed in the extravagant multiplication of tools, jigs, gages, drawings and patterns, regrettable though it is, does not end the burden on the air service through this variety of designs. The effect, for instance, on the stocks of spares may easily be imagined; and, as we understand, the engines are so different in construction that aerodromes at the front not only require separate spares for the several types that are used there, but have also to keep for purposes of overhaul separate gangs of mechanics, versed in their individual peculiarities.

Standardization in Factory Buildings

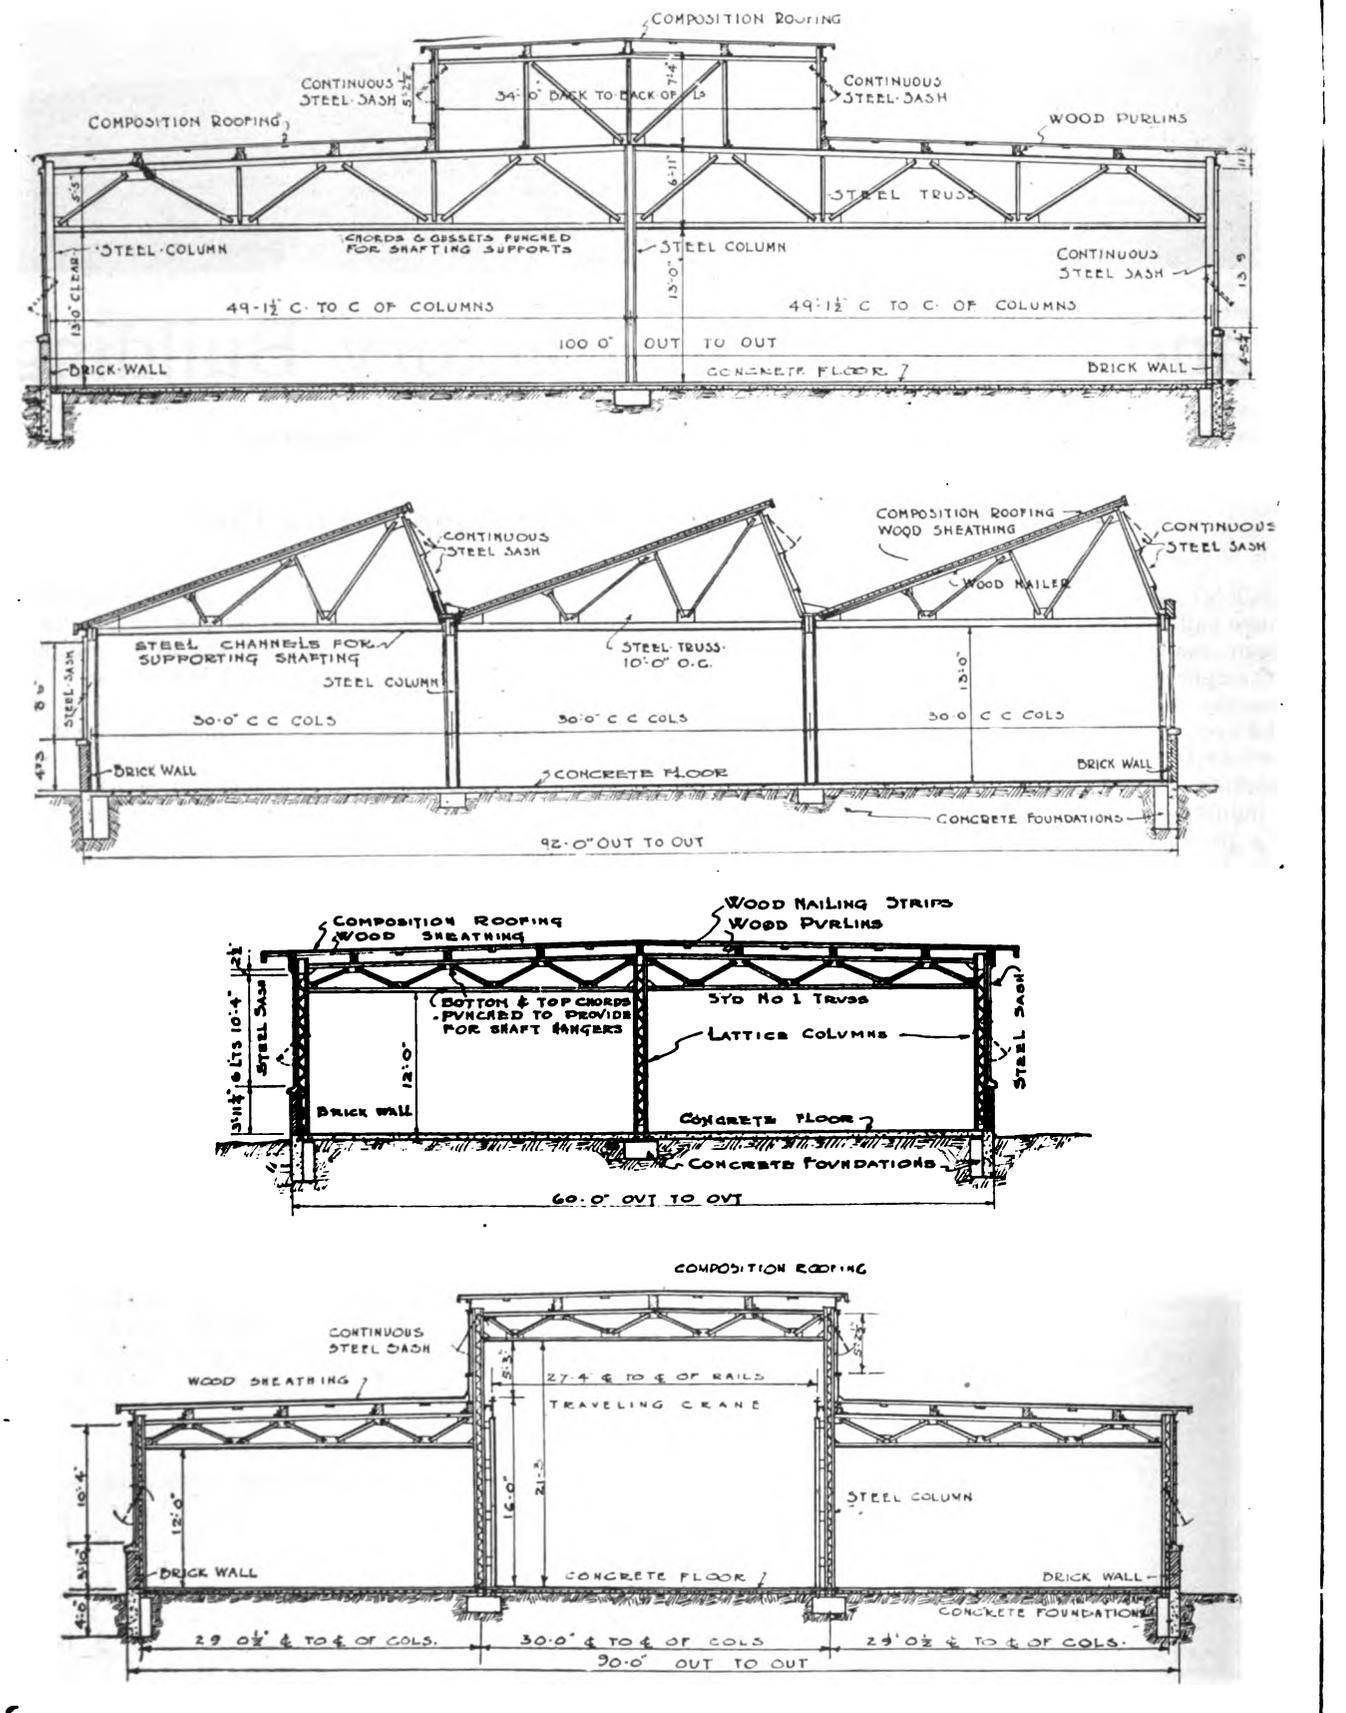
Industrial Plants Built According to Standardized Plans, with a Structural Steel Framework Fabricated in Advance, Can Be Erected Rapidly and at Low Cost

RECENT achievements in rapid plant construction have called attention to the great progress that has been made in standardized industrial buildings. With the appreciation that standard construction has met with in the automobile industry, there is little wonder that the eyes of the automobile world have been attracted by the merits and economy of this method of building construction. The case is exactly parallel to that of any other industrial product. Wherever a purchaser has to order a product especially designed and built for him, it naturally requires a long time for delivery, is much more expensive, and oftentimes not as satisfactory as a standard product. This, of course, is keenly realized by automobile and automobile parts manufacturers, and in the same manner it can readily be seen that standardization might equally well be applied to the building industry.

When a man builds his home he wishes it to possess beauty as well as utility. The building of real homes will never be standardized. When a man wishes to have a factory built he thinks of utility, permanence and economy far more than he thinks of beauty. It is a place for production. It is susceptible of standardization both in design and construction.

Façade (left) and interior (below) of the Hudson - Stuyvesant Motor Co.'s building

The Austin Co. of Cleveland has put this standardized building idea on a practical basis and has put up standardized buildings for a number of concerns in the automobile industry, such as the Packard Motor Car Co., Nordyke & Marmon Co., Peerless Motor Car Co., King Trailer Co., Jackson Rim Co., Jackson Wheel Co., Mott Wheel Co and a number of others. These buildings are standardized as to design, construction and cross-section dimensions, but vary as to length. Each building requires the minimum of material for good construction, and, consequently, can be built in the shortest time at moderate cost.



Advantages of Standardized Construction

The great value of standardized construction service is made possible by several newly recognized means to efficiency: The application of the best engineering talent to the given design; doing away with the necessity of working out details in each instance; purchasing materials at that geographic point where the market quotations may be lowest; carrying in stock, ready for immediate shipment, structural steel and practically all other requisite materials; speeding up of freight shipments; pushing all phases of construction simultaneously; sending out dependable erection forces trained to the standard method.

One of the basic ideas of the standardized building proposition is that if factory buildings can be erected in one-half or one-third of the usually required time, this means that the manufacturer gains weeks or months in production profits. If buildings can be put up in any multiple of a given length (say 20 ft.) this means that

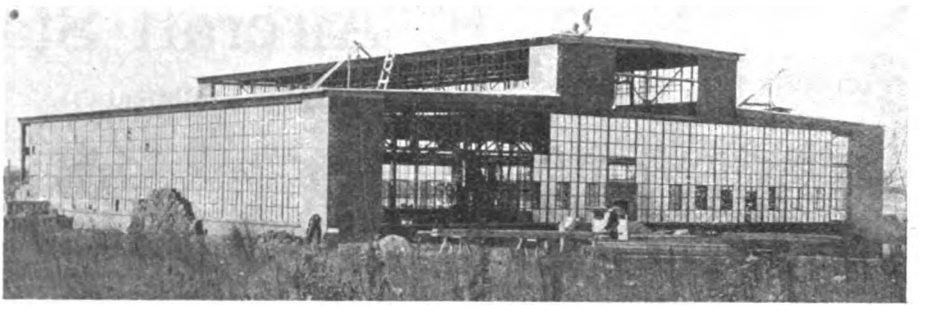
Digitized by Google

Cross-sections of four types of single-story buildings

Digitized by Google

they are flexible units and that the owner may, at any time, by a re-employment of the standard design, add to or alter his commercial establishment in any way.

About thirty out of 300 of these structures, or 10 per cent, have been erected by the Austin Co. for firms in the automobile industry. The Austin Co. has found that by nine types of standard factory buildings they can cover the essential requirements of stabilized industries. Seven of these are one-story types; the minimum width is 60 ft.; each type is variable in length. Three types are completed under penalty in thirty working days after order, and four types in sixty working days. The time limit for the two multi-story models depends on size and conditions; but these also are short-time types.



The nine types of Austin standard factory buildings include three types that can be completed ready for occupancy in thirty working days after the order is placed; four sixty-day types and two multi-story types that require somewhat more time. This remarkably quick construction is possible only because much of the work is done before the order is received. Plans are standardized and ready. Specifications are prepared and basic costs figured. Structural steel is ready-fabricated. Other materials are in stock or easily procurable in the standard sizes used. In short, these buildings are shop-manufactured in advance of the order for quick assembly on the owner's land. And they are in no sense portable or temporary buildings, but substantial structures for permanent service.

Careful analysis of large industrial plants indicates that no matter how highly specialized certain portions of these plants may be, there is a striking similarity in 30 per cent to 40 per cent of the floor space.

When general business is active, building is active—to the point where, in conformity to the law of supply and demand, advancing costs reach a prohibitive figure, then the pendulum swings backward. A chart of building activities for a period of 5 years shows an alternation of high peaks and deep depressions. How can the curve be equalized? By buying materials when prices are low, and carrying them in stock for future use—and this can be done only when buildings are standardized. This points to the desirability of standardization in building.

Showroom in Hudson-Stuyvesant Motor Co.'s building

Anderson Tire Co.'s Plant

The floor area may be varied at will. Standards may be any desired length in multiples of the bay, and further variations may be attained by the suggested combinations.

Under the old method of treating every building as a highly individual project, the owner, when he decides to build, communicates his requirements to an industrial engineer. The engineer studies the requirements, designs the building and submits the plans. The owner calls for certain changes, which are made. Two or more builders are then asked to submit estimates, and time is taken to get the bids in, compare them, and decide who shall have the job. At last the contract is let. Eight or 10 weeks have gone before a hand is turned in actual construction. In this time any of the one-story standard factory buildings could have been completed. But the builder under the old method is just beginning. He must order his material at current prices, have structural steel fabricated, perhaps have sash and doors made to order, and lumber cut to waste, to meet the individual plans.

It is possible for a company making these standardized buildings, knowing in advance what materials they require, to buy in quantities at advantageous prices. For instance, when there is a lull in the structural market, the steel companies are able to turn out these standardized fabricated structures at a low price, and this saving can readily be taken advantage of by those putting up factory buildings. A brief summary of the standard types may be of interest:

List of Standard Types

No. 1 is a building for storage or light manufacturing, requiring 30 working days for its completion. It has a width of 60 ft. and the length may be any multiple of 20 ft. The roof trusses or beams have ample strength for supporting shafting, and are set horizontal for that purpose. The beams are also strong enough to carry a monorail for loads up to 1000 lb.

No. 2 requires 30 working days, is 90 ft. wide, with three 30-ft. aisles of the trussed construction. The lengths are in multiples of 20 ft. Auxiliary columns may be provided to carry a traveling crane. This standard building may be extended sidewise to include any desirable number of aisles, or can be used as an upper story to Austin standards No. 8 and No. 9.

No. 3 is the most commonly used type. The building is 100 ft. wide, which is the most economical maximum that can be well lighted through side walls and one monitor. It is amply ventilated and has broad areas of unobstructed floor space. As there is only one column to every 2000 sq. ft., the length may be as desired, in multiples of 20 ft., and the building is susceptible of various combinations. The other standards carry the idea further along.

No. 4 is a saw-tooth building which can be furnished

Aeroplane Engine Testing

S. A. E. Recommended Aeronautic Practice

The following test specifications are divided into two classes, one a Routine Factory Test and the other a Type Test.

Routine Factory Tests for Fixed Engines

(Low or Normal Compression)

Test No. 1

Engines may be run in by such methods as are found most satisfactiry for each type of engine, but must not be run under own power over ten hours before the first official test.

Test No. 2

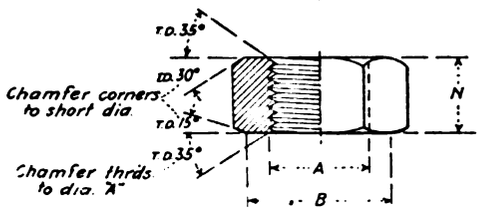
For engines with compression ratio 5 and below.

Engine will be mounted on a torque stand or stationary stand and fitted with club or propeller, properly calibrated for rated load at rated speed. Engine will be fitted with all the accessories that are to be supplied by the engine manufacturer. If started by hand, it must in every attempt be started within five minutes by one man.

Test will consist of: Four hours continuous running at rated power and rated speed. All readings required shall be recorded on S. A. E. standard log sheet every ten minutes.

(a) The test must be continuous and in case of a stop occurring during the first hour, the run will be repeated.

(b) In case of a stop occurring after the first hour and not due to a fault of the engine, the run will be continued, but the inspector may require an extension of the running time equal to twice the time lost.



When a stop occurs at any time due to a fault of the engine, the inspector may require the complete run to be repeated.

(c) No manipulation of the engine, while running, will be allowed, except such as can be made by a pilot from his

seat. Replenishing of gasoline and oil supplies and regulating of the cooling water temperature is allowable.

Engine will be disassembled, inspected and if all parts are accepted, it will be re-assembled. If in the opinion of the inspector, parts must be replaced, he may require the whole or portion of the run to be repeated.

Test No. 3

Engine with all the accessories that are to be supplied by the manufacturer will be mounted on a torque stand and fitted with a club or propeller, properly calibrated. It will be given a continuous run of one hour at not less than rated power and rated speed. All readings required will be recorded on S. A. E. standard log sheet every ten minutes.

After this test the engine shall be cleaned and inspected and put into condition for shipment. If satisfactory, the engine shall be stamped by the inspector.

Note—If desired, the horsepower may be corrected for air temperature and barometric pressure. In such cases the power will be corrected to a surrounding air temperature of 59 deg. F. (15 deg. C.) and normal sea level pressure which is 29.92 (760 mm.) of mercury at 32 deg. F. (0 deg. C.) and at 45 deg. latitude.
In case of question the corrected power shall govern.

(High Compression)

Test No. 2A

For engines with compression ratio exceeding 5:

Engine will be prepared as under Test No. 1 and No. 2.

This test will consist of four hours continuous running at 8/10 rated load and rated speed. Otherwise, this test will be the same as No. 2 and the same rules will apply.

Disassembly and inspection will be the same as in Tests No. 2 and No. 3.

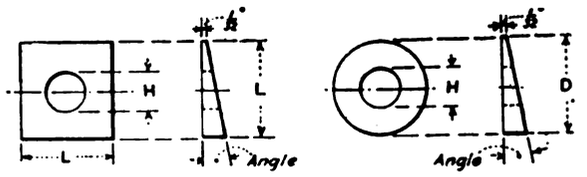
Test No. 3A

This test will be the same as No. 3, but at 8/10 rated load and at rated speed.

After this test, the engine will be inspected and accepted as in Routine Test No. 3.

Type Tests for Fixed Engines

(Low or Normal Compression)



The first engine of a type and one out of each hundred in production will be given the following test:

Selection of this engine shall be made by the inspector without previous notice to the manufacturer.

The engine must not run under its own power over 10 hours before the first official test and must be taken from regular production. (See No. 1 Routine Test.)

Bevel Washers

Test No. 4

For engines with compression ratio of 5 and below.

The engine is to be mounted and equipped as in Test No. 2 of Routine Tests and fitted with a club or propeller properly calibrated.

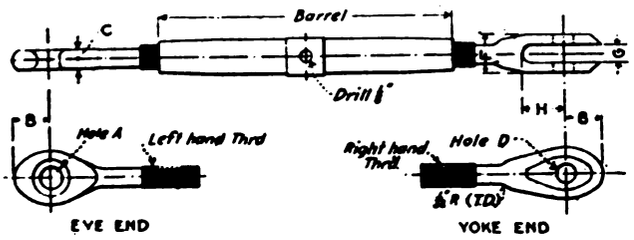
Total running time shall be 50 hours, divided as follows:
Five hours at 9/10 rated power and at rated speed.
Not over one hour stop with minor adjustments allowed.
Five hours at 9/10 rated power and at rated speed.
Not over 13 hours stop during which engine may be disassembled, overhauled, carbon removed, valves ground and adjusted, magnetos and spark plugs cleaned and adjusted. No adjustment or replacement of major parts is allowed. Any multiple part, such as a valve, may be replaced when replacement is made necessary through defective material. In no case, however, shall more than one such part be replaced during the entire 50 hours.

Five hours at 9/10 rated power and at rated speed.
Not over one hour stop with minor adjustments allowed.
Five hours at 9/10 rated power and at rated speed.
Not over 13 hours stop and same work allowed as before.
Five hours at 9/10 rated power and at rated speed.
Not over one hour stop with minor adjustments allowed.
Five hours at rated speed and at rated power.
Not over 13 hours stop and same work allowed.
Five hours at rated power and at rated speed.
Not over one hour stop with minor adjustments.
Five hours at rated power and at rated speed.
Not over 13 hours stop and same work allowed.
Ten hours at rated power and at rated speed.
Rule (c) under Routine Test 2 will apply to each run.

In case of a forced stop during any of above runs, rules (a) and (b) under Routine Test No. 2 will apply.

If the stop is due to a failure of any multiple part such as a valve, the part may be replaced, providing such failure is due to defective material and a similar part has not previously been replaced since the 50-hour test was started.

During complete run all required readings must be recorded on S. A. E. standard log sheet every 10 minutes. The mean power (see note under Routine Test No. 3) must not fall below the rated power; and gasoline and oil consumption must not exceed the predetermined maximum.



After the test is completed, the engine is to be disassembled and, if acceptable to the inspector, may be reassembled after replacing any parts which the inspector may designate.

Test No. 5

Engine is to be mounted in a fuselage or tilting stand and fitted with propeller. With the axis of the engine making 15 deg. with horizontal, it is to run at full power full speed for 15 minutes. Then without altering speed or any part, or adjustment, the axis is to be brought again

Turnbuckles for Aircraft

The dimensions given are for short and long turnbuckles, each length having either two eye-ends or one eye-end and one yoke-end.

horizontal and then tilted to 15 deg. in the opposite direction and run 15 minutes.

If this test is satisfactory, the engine will be put through Routine Test No. 3 except that the running time shall be 30 minutes instead of one hour. After this test, the engine will be inspected and accepted as in Routine Test No. 3.

(High Compression)

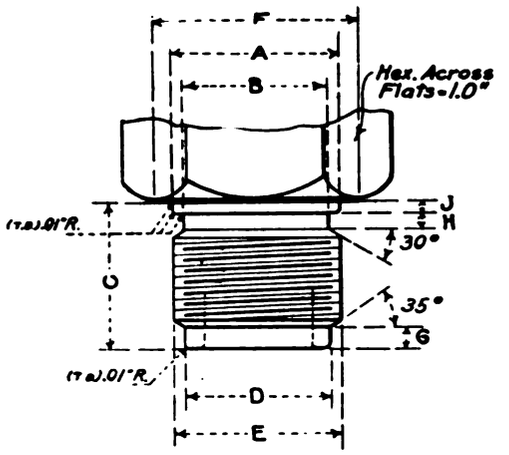
The same rules apply regarding preparation and selection as for Test No. 4.

Test No. 4A

For engines with compression ratio exceeding 5.

This test will be the same as test No. 4, but the first five runs shall be made at 7/10 rated load and at rated speed. The next four runs will be made at 8/10 rated load and at rated speed.

Disassembly and inspection will be the same as in Tests No. 4 and No. 5.



Test 5A

Engine will be put through a test the same as No. 5, but at 8/10 rated load and at rated speed.

If the engine passes Test 5A it will be put through Routine Test No. 3A except that the running time will be 30 minutes instead of one hour. This engine will then be inspected and accepted as in Routine Test No. 3.

Spark-Plug Shell Dimensions

S. A. E. Recommended Aeronautic Practice

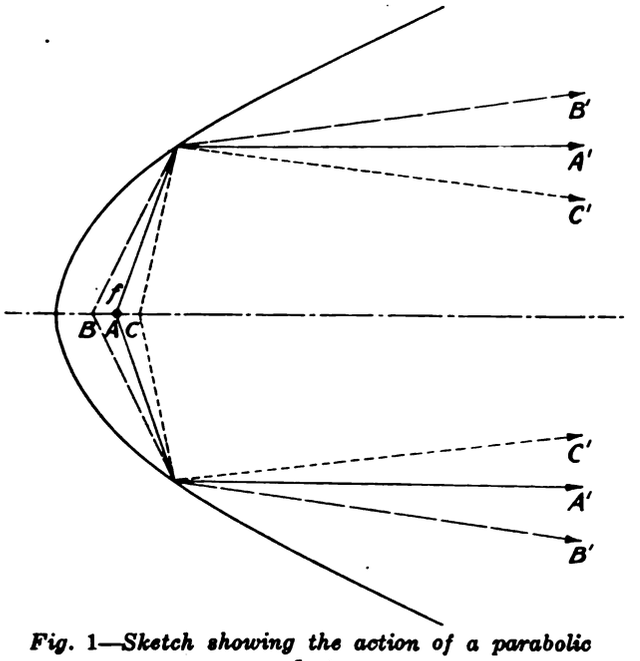
Recommendations for Focusing Automobile Headlamps

G. L. Sealey*

WHEN automobile headlamps are properly focused, the center of the filament of the incandescent lamp coincides with the focal point of the reflector. When this condition is attained, the resultant beam is concentrated, dark spots are eliminated, objectionable stray light is diminshed and the greatest amount of useful light is obtained. The sketch, Fig. 1, shows simply how the light is distributed by a parabolic reflector for three positions of a point light source. A', A', are parallel beams distributed when the point source is at the focus, while B', B', and C', C', are the beams distributed when the point source is, respectively, back of and in front of the focus. Although the filament of an incandescent lamp is not exactly a point source, and without going further into the theory of the parabolic reflector, it may be said that the concentrated filament of a mazda C lamp acts in the same general way as a theoretical point source. When the incandescent lamp is at the focus of a parabolic reflector, a beam of small diameter is directed forward which, when intercepted perpendicularly by a large card or paper, will give a light spot as shown by the photograph of Fig. 2. When the incandescent lamp is in front of or back of the focus, the light spot on the card will resemble that of Fig. 3.

An ideal location for focusing headlamps is a straight roadway having at least 75 ft. between the car and the side of a garage, or other surface vertical to the road, on which is drawn a line or mark 42 in. above the road level. When such a spot is found, the car should be placed so as to have the headlamps facing the side of the garage and projecting the light upon it. The relative position of the filament and focal point of the reflector should then be changed by moving the incandescent lamp (by means of the socket adjustment) forward or backward until the light spot of smallest diameter, or greatest concentration, is secured, as shown in Fig. 2. This operation should be performed on one headlamp at a time so as to be certain that each headlamp is correctly focused.

*Engineering Department, National Lamp Works of General Electric Company.



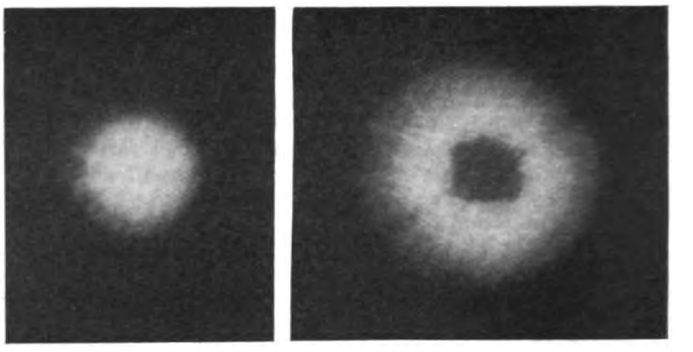


Fig. 1—Sketch showing the action of a parabolic reflector

Figs. 2 and 3—Spots appearing on card when lamp bulb is in focus and when it is either forward or back of the focus respectively

Four Types of Focusing Devices

The four principal types of automobile headlamp focusing devices, or socket adjustments, are: (1) rim, (2) external, (3) bulb, (4) rear. In the rim type of adjustment the incandescent lamp is moved forward or backward by turning a screw placed on the rim of the reflector, and in the external type of adjustment this adjusting screw is placed to the rear of the lamp housing. In the bulb type, adjustment is accomplished by twisting or turning the incandescent lamp bulb. It is necessary to remove the reflector from the headlamp, and to loosen a screw or other means of holding the lamp in position at the rear of the reflector before adjustment can be made with the rear type. The latter two devices are not considered satisfactory since they necessitate the direct handling of the incandescent lamp or the dismantling of the headlamp in order to secure the desired result.

When the filament has been brought to the proper position with reference to the focal point of the reflector, that is, when the lamp has been properly focused, the height of the main beam of light above the level of the roadway should be carefully observed. Most state laws require that at 75 ft. in front of the car the main beam of light shall rise not more than 42 in. above the level of the roadway under any condition of loading. By carefully observing the line, or mark, on the side of the garage and the beam of light obtained from the headlamps this law may be complied with. It is often necessary to tilt the headlamps slightly by bending the supports in order to accomplish the desired result.

Rules for Focusing

While the main point is that the direct light should be kept below the 42-in. line, it is also well to remember that the beams from the two headlamps should be so projected that they do not spread the light mainly to the side of the road instead of directly ahead. When the headlamps have been adjusted so that the lamps are properly focused and the light does not rise above the 42-in. line, the location of the beams from the two lamps with respect to one another should be considered. To have the road properly illuminated the two circles of light should slightly overlap one another at 75 ft. In other words, the most desirable illumination is obtained when, with the proper consideration of the other points just mentioned, the two beams slightly overlap rather than widely diverge. If the two beams are divergent they may be brought into correct relation by bending the supporting forks for the headlamps or by adjusting the rod connecting the two.

With the increasing agitation for laws to eliminate glare and an increasing attempt on the part of automobile drivers

Digitized by Google

to be more courteous on the road, it is necessary that headlamps be correctly focused. It has been found that the great majority of automobile drivers are not fully acquainted with the method for properly focusing their headlamps. Since this condition exists, it is suggested that a straight stretch of roadway, with a garage, barn, or other vertical surface on which a 42-in. line may be marked, be found, and this place called to the attention of automobile drivers in each locality so that when in doubt they may drive up to this particular location and carefully measure the height to which the top of the beam rises. This will result in better compliance with existing laws. A little attention given by automobile drivers to the above points may prevent unpleasant situations with officers of the law.

Straight Cut Refinery Products

By George M. Holley

MR. HASTINGS has called to my attention a quotation from a paper by Dr. E. W. Dean, as follows:

"The Bureau of Mines has had called to its attention many devices for the utilization of kerosene, but believes that mechanical development in this particular line is a mistake. The logical and reasonable way to utilize kerosene is not as such, but as a mixture with the gasoline produced with it in the refining of crude oil. In other words, attention should *not* be given to the utilization of petroleum distillates containing both the gasoline and kerosene fractions of crude oil."

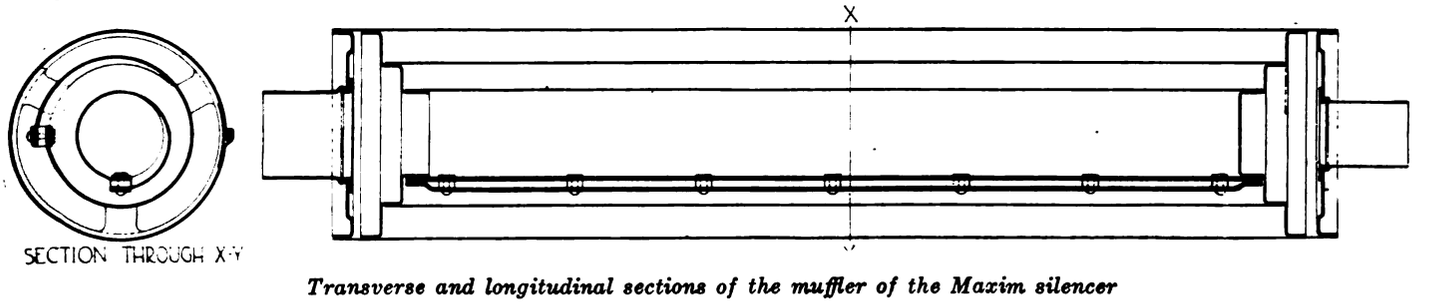
I am taking it for granted that the word "not" in the above paragraph is a typographical error, and should have been omitted, as, with this word in, the whole paragraph disputes itself.

This quotation is one of the most far-seeing statements I have read in several months. We have had here at the factory for several months straight cut fuels from refineries containing practically all of the gasoline and all of the kerosene which can be obtained from a barrel of crude, and it is self-evident to us that in the long run straight cut fuels will be used in preference to what is called either gasoline or kerosene at the present day, in other words, all of the fuels with a boiling point below 550 deg. In the particular field from which we obtained our straight cut fuel, this multiplied the yield from a barrel of crude by three. The straight cut fuel would cost only a trifle more. In the winter time it is a little harder to start, and, unless the vaporizing apparatus is very efficient, it does not drive away as well as ordinary gasoline.

We, however, take exception to Dr. Dean's statement that it is a mistake to develop devices for the utilization of kerosene, simply because a carbureter which will efficiently use kerosene oil will handle any other fuel that much more efficiently. A perfected kerosene carbureter is a highly perfected gasoline carbureter, and will give very much better satisfaction on ordinary gasoline. A highly developed kerosene carbureter will use ordinary gasoline in zero weather, just the same as the old type carbureters use gasoline in summer weather. In other words, atmospheric temperature does not affect carburetion.

The more you can drive home the straight cut fuel proposition, the larger the available fuel supply will be.

Exhaust Muffler Based on Gun Silencer Principle



EVER since Hiram Percy Maxim invented the gun silencer he has been manufacturing on a small scale an explosion engine muffler based on the same principle. Recently Geuder, Paeschke & Frey, the well-known Milwaukee firm specializing in deep drawings of metal, has secured a license under the Maxim patent, and as it has very extensive works the prospects are that the Maxim muffler will be turned out hereafter in large numbers. A sectional view of this device is shown herewith. The exhaust products enter the central chamber at one end and thence pass into an annular chamber surrounding the central chamber, not through a multitude of holes as is customary, but through a slot 3/16 in. wide extending the entire length of the muffler. From the intermediate chamber the gas passes to the outer chamber in the same way—through a 3/16-in. slot the entire length of the muffler, but the direction of motion is the reverse this time. From the outer chamber, where, of course, the hot gases are subjected to a strong cooling action, they pass through three large punched holes in the inner header into a chamber at the end of the muffler and thence through the central discharge pipe to the atmosphere.

Mr. Maxim contends that in the discharge of the spent gases from the engine cylinders there are two distinct noises. The first, known as the primary noise, is caused by the high pressure gases issuing from under the suddenly lifted exhaust valve. This may be called the pressure noise, because it is due to the high pressure of the gases when the exhaust valve liberates them and to distinguish it from the other noise, the gas puff noise, which is produced as the gas issues from the exhaust pipe into the muffler device. This latter might be called the quantity noise.

Referring to the cross-sectional sketch of the Maxim muffler herewith, the way in which the pressure noise is prevented is easily explained. This noise consists of a wave which originates at the exhaust valve when the latter suddenly opens, the wave traveling through the exhaust pipe and into the inner tube of the silencer. It passes out of the latter through the tangential slot. Part of the wave passes one way and part the other way, because a noise wave, unlike a column of advancing gas, has no inertia. The splitting up of the wave continues at the outlet of the intermediate tube. Each time either one of the two waves coming through the inner tube leaves it, part of the wave is broken up, and these separate parts start traveling in both directions around the central tube. The original wave is thereby split up into a great number of smaller waves and is thus rendered quiet.

To overcome the quantity noise it is the general custom to obstruct the path of the gases in one way or another. Sometimes perforated baffle plates are placed inside the muffler, or again perforated concentric tubes are used. In the Maxim muffler the kinetic energy of the gas is dissipated in an entirely different manner. Instead of obstructing the escape of the gas, the latter is allowed to issue from the central tube through a tangential slot into the next tube. This causes a whirling of the gas, fresh incoming gas constantly being added to the whirl. No obstruction is placed in the path of the gases, the energy being dissipated by the cooling effect and by friction against the walls.

The outer cylinder of the muffler is lock-seamed and spot-welded right through the four thicknesses of metal, and the headers are spot-welded to the tubes. A muffler 24 in. long and 5 in. in diameter weighs 8 lb.

Body Details At the Salon and the Palace

Tendency Toward Lower Construction and a More Pleasing Appearance—Greater Comfort Also an Object

By George J. Mercer

THE two chief aims in body design are to keep the body low and light looking, and parts of the car that are separate from the body proper, but have a contributory effect, including the guards, the engine hood and radiator, the runboards, the gasoline tank, the lamps and the wheels, have all been altered with the above-mentioned ends in view.

Wheels are smaller, the wire wheels, especially, being 2 to 4 in. less in diameter than formerly; the runboards now average 15 and 16 in. from the ground to the top, a gain of 2 and 3 in.; the mud splasher, as shown in Fig. 1, helps in the same relation, and the long front guard meeting the runboard back at the dash line, as illustrated in Fig. 2, is a considerable help. The engine hoods are higher, necessitating a higher radiator, and permitting a higher cowl. The long, narrow louvres, as illustrated in this same view, give a distinctiveness not obtained in the older form.

The elimination of the lamp on the dash by the provision of dimmers on the headlight has been a decided improvement. Fig. 1 shows two ways of supporting the headlights. At the left the bracket is mounted on the frame, while at the right it is attached to the guard. The latter is very much the best arrangement; it looks cleaner, and as a tie rod is used in both cases, there can

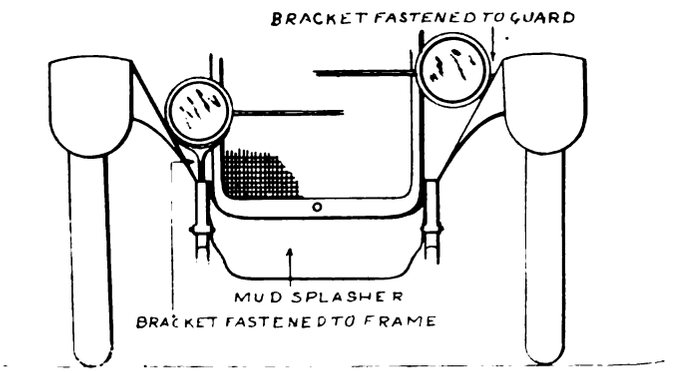

Fig. 1—Lamp support and splash guard

be no question as to the durability of the bracket on the guard. The diameter of the headlight front is important from the standpoint of appearance. On some cars this was 7 in., which looks insufficient. On others it was 10 in. and 12 in., which is better. Also, it is a mistake to have the metal rim black; if the rim is nickel the size of the glass appears to be increased.

Placing the gasoline tank at the rear was the first step toward lowering the bodies. Taking it from under the driver's seat permitted of the cushion being placed nearer the floor, and the roof line came down proportionately. With the lower seat the steering wheel must be

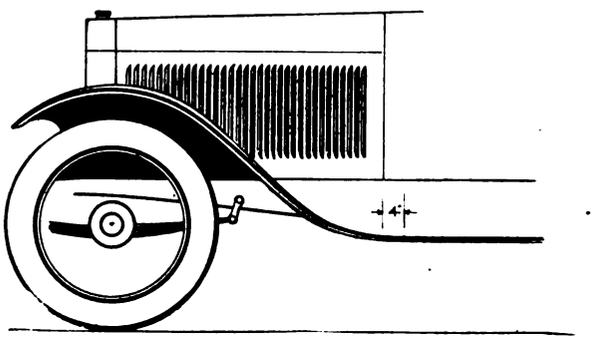

Fig. 2—Front fender running board joint

placed lower and more room provided for the driver between the dash and seat back.

Practically all cars have a kickup in the frame at the rear to provide clearance for the rear axle, and the portion of the frame forward of the rear guard is 2½ to 3 in. lower, making an average height from the ground of 25 in. To make a low-looking car this height should be 2, or preferably 3, in. less. The Pierce chassis has a double drop frame, the drop starting back of the dash and extending to the usual point in the rear. Other makers do not see enough advantage in this construction to adopt it; in fact, some who used it in the past have discarded it. Other builders have the body sides extend down over the frame, as illustrated in Fig. 3. The base line of the body is about 2 in. below the top of the frame, the floor boards being of this thickness, with just enough clearance not to touch above, and the body is supported on brackets. This is good construction, as there is less running length of contact, and squeaking due to friction between body and frame is obviated.

Sport Body and Conservative Type

Bodies can be divided into two classes on the basis of height—the sport body and the conservative type. The former is lower because the user is willing to sacrifice some degree of comfort for the sake of appearance; the latter is designed on lines that give the maximum of

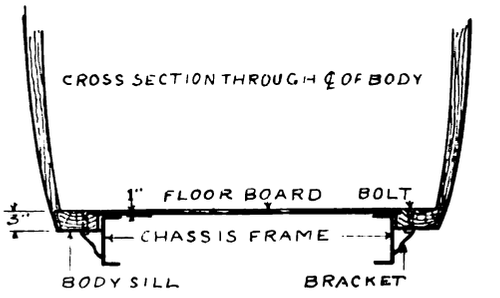

Fig. 3—Mounting of body on frame

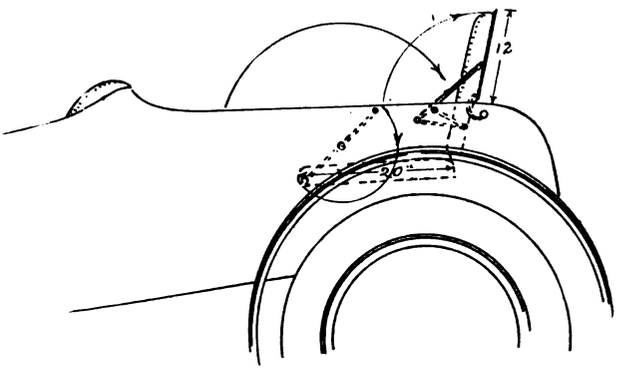
Digitized by Google



comfort. A body can be made very low if the cushions are placed on the floor, but it requires a young, slender person to get in and out of a body like this. A good rule for height is to have the eyes of a person seated in a car level with those of one standing on the ground. When this is the case a body will look right.

Fig. 4 is a four-passenger, close-coupled touring body, and illustrates the bevel-top edge that has come into such extensive use within the past year. Section A-A shows this in larger size, and the dimension 5/8 in. is a maximum. A moderate bevel looks well, an excessive one looks showy. This bevel gives the appearance of reducing the height of the side more than it actually does. Sometimes a paint stripe line is added about 1½ in. below the bevel, on the side. To look well it must be an inconspicuous stripe. The only place for a wide stripe is on the top, close to the outer edge. The popularity of the bevel edge is due to the fact that it allows the line to be continued from the radiator through the engine hood and to the rear without raising perceptibly. The back of the rear seat is high, but is concealed by the gypsy curtain quarter.

Proper Height of Body Sides

The dimensions given are for comfortable seating. Some makers have the sides 4 and 5 in. lower than here illustrated, but this will not give a feeling of security. The sides must come above the seat cushion sufficiently to make the passenger feel that he is riding in the car and not on top of it. To make the top of the driver's seat inconspicuous is the most difficult task for the body builder. The narrow second cowl of moderate height, and blending with the bevel edge, is largely used; but a cowl as shown in the illustration is coming into popularity. Handles on the outside of the doors are shown; these seem to be coming back into favor, probably on account of the trouble of finding the inside handle. The outside handle serves to close the door, and does away with the pad used in conjunction with the inside one.

The robe rail and the folding seats are two parts of the touring body that are prominent, and call for attention. The robe rail formerly was a stiff metal bar with handles at the ends. In a few cases this is retained, but the majority use an adjustable strap. The seats are practically all of the flush-folding type. Very few have the inner arm rest, and a depression is made in the front-seat back to receive them when down. Different plans are used to conceal them, but unless this is made in the form of a locker, which is expensive to build, the seat had best be left exposed. The drop curtain is not a success, because the space into which the seat folds is used as foot room when the seat is up, and when the curtain is used the cut is as low down as possible, and its edge interferes with the knees.

Folding seat dimensions

The use of the molding to cover the opening of the doors has been superseded to a great extent by having the panel project beyond the pillars, as shown in Fig. 4, representing a section of the door. In one construction this thin ledge projects over the body panel and forms an offset, the doors giving a raised panel effect on the side of the body of approximately 1/8 in. Carelessness of the builder in making bodies in which this offset varies from 1/8 to 5/16 in. has brought this method into discredit in high-class work, and it is now more customary to have the door set in flush with the body panel and show a narrow opening all around. This opening must be uniform, or it looks bad. The ledge on the door is formed by wrapping the panel sheet over the steel edge plate.

Folding Seat Details

Fig. 5 illustrates the folding seat used on runabouts. This is just the customary seat in which the two lids of the deck of the hammer are turned, one to an upright position to the back, and the other forward one revolved over to form the cushion, but the illustration is an improvement over the majority in that the height of the lid forming the back is less. The space required to make the well opening is 30 to 32 in. long, and it has been usual to divide this in the middle, making the lid that forms the back 15 or 16 in. high. The illustration shows this cut to 12 in. There was also provision for a top covering for this seat shown on several cars, the stand-

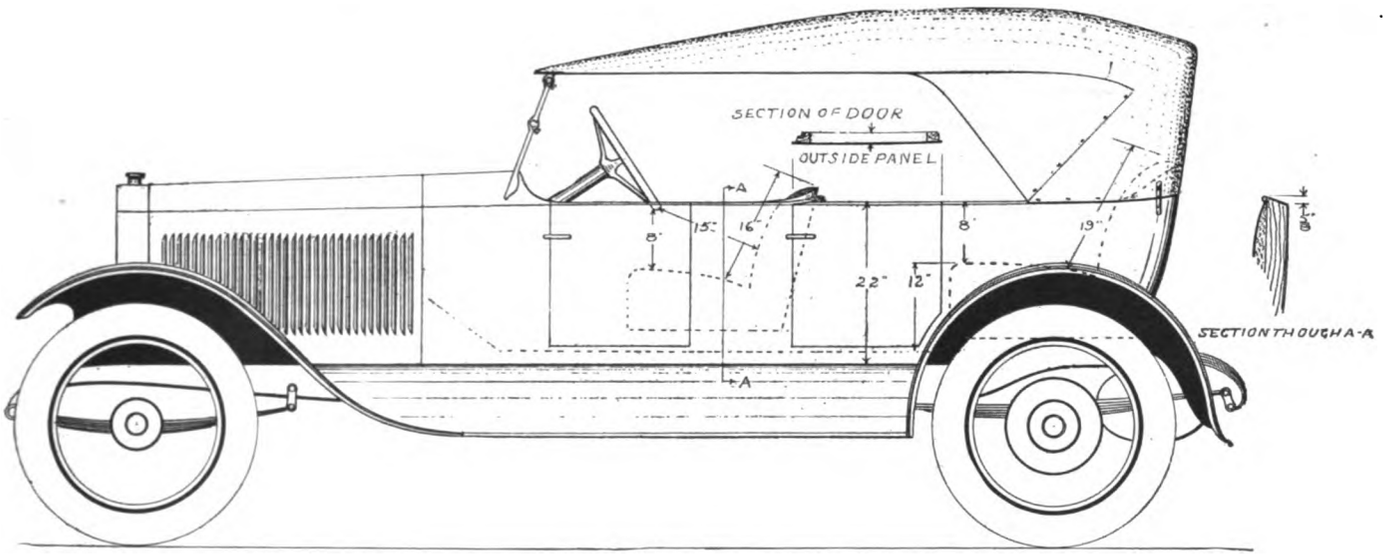


Fig. 4—Elevation of close-coupled touring body with bevel top edge

ards and sockets for securing same being concealed in the well when not in use.

Most bodies are made with a wood framework, and over this is the sheet or aluminum panel, the method of framing and assembling the panels on the framework being changed according to the scale on which the model is produced. The all-metal body has been made almost from the beginning in the open type. It has the advantage that production can be handled more satisfactorily, and cost and time more readily controlled. This kind of a body, when the doors are closed, is apt to make a noise like the clanging of several pieces of loose steel. However, an all-metal body can be produced and the doors made to work satisfactorily. This can be done in almost any one of the present designs, and without material difference in the manufacturing costs, provided the experimental work is carefully done. With the all-metal body, either of castings or pressed steel—and the latter is the one most generally used—the preliminary work is the chief item, because once jigs, dies and patterns are made, it is almost impossible to make changes.

The open body is the standard stock proposition of all manufacturing concerns, and the all-metal body is bound to be the one most used, except among those who cater to a fluctuating trade that demands novelties. The older construction of a wood framework and metal construction will meet best the requirements of this trade. Either form of construction will meet all the demands of service and wear. The wood and metal, however, has the advantage of not requiring such a heavy outlay for tools and machinery, and that changes in models can be arranged for more easily.

Reversible Engines for Marine Work

WITH the exception of some small boats fitted with two stroke engines, practically all motor boats now are equipped with reverse gears. However, the four stroke engine may also be made reversible, and it would seem that if boats are to be equipped with electric starters, which can easily be arranged to start the engine in either direction at will, the reversing possibilities of the four stroke engine may well be taken advantage of, because very little additional mechanism is required, and this allows of dispensing with a bulky and heavy reversing gear.

General Reversing Principle

Wolseley Motors, Ltd., of Birmingham, England, have been giving some attention to this problem and have developed a design on which they have secured a British patent. In reversing the direction of rotation of the crankshaft of an internal-combustion engine, in which the sequence in which the cranks are operated by the pistons is the same in both directions of revolution, it is convenient to utilize the same camshaft both for forward and backward running, and it is well known that this can be effected by driving the camshaft through a three-bevel drive which is provided with a jaw clutch so that the direction of drive between the camshaft and the crankshaft may be reversed, the camshaft always revolving in the same direction.

The Wolseley invention applies to multi-cylinder engines in which there are two lengths of crankshaft, each of which if used alone with its corresponding cylinders and pistons could be reversed through the medium of a three-bevel drive, but which if taken together could not be so reversed, if used in connection with a camshaft on which the cams were unalterably fixed and which was common to all the cylinders; and consists of a modification of the invention described in Patent Specification No. 14480 of 1916, according to which there is used, in respect of each length of crankshaft, a camshaft in respect of the valves for each corresponding group of cylinders, and the camshafts are both driven through a single reversing mechanism and connected with one another through the medium of a clutch which can be moved to couple two shafts together in two different angular relations to one another, namely, in the relation to one another required for the forward running of the engine, and in the relation to one another required for the reverse running of the engine.

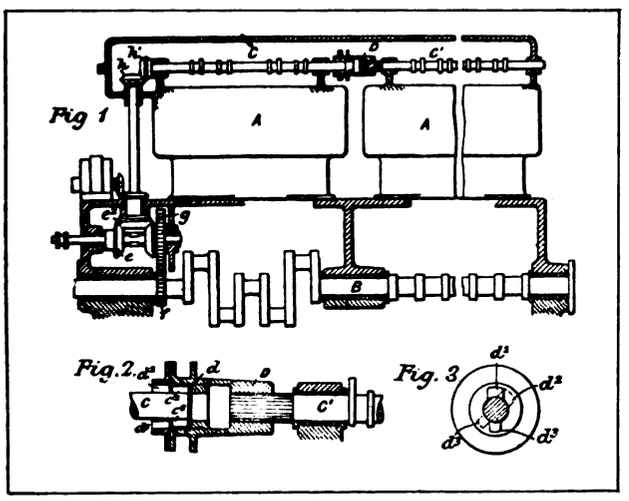

Diagram of eight-cylinder reversible engine

A, *A* are groups of cylinders of an eight-cylinder engine and *B* is the crankshaft. The camshafting for operating the valves is formed in two lengths *C*, C^1, which may be coupled together by a clutch *D*, and may then be readily uncoupled by moving the clutch endwise into its mid position shown clearly by Fig. 2. These lengths of shaft are both driven from the crankshaft through the medium of the spur wheels *f* and *g*, three-bevel drive *e*, e^1, e^2, and bevel wheels *h*, h^1. The clutch *D* is slidable upon a splined end of the shaft C^1, and cannot therefore turn in relation to such shaft. The end of the shaft *C* is formed with teeth c^2, c^3, which differ substantially in size or shape, and when the clutch is in its mid position, as shown by Fig. 2, are within a chamber *d* of the clutch which constitutes a neutral space, and the shafts *C*, C^1 are then unclutched from one another. Within walls of the clutch, which are at opposite sides of the chamber *d*, are formed gaps or notches d^2, d^3, of which the gaps d^2 correspond in size to the tooth c^2, and the gaps d^3 correspond in size to the tooth c^3.

Method of Operation

In reversing the engine, the endwise movable member of the clutch mechanism of the three-bevel drive is operated to reverse such drive, and the clutch *D* is moved to its mid position, thereby uncoupling the camshaft C^1 from the camshaft *C*. As the camshaft *C* is then turned by the crankshaft, the clutch *D* is pressed still further in the direction in which it has been moved to uncouple the shaft C^1 from the shaft *C*, and immediately the gaps d^2, d^3, of the wall of the clutch which is then pressing against the ends of the teeth c^2, c^3, of the shaft *C* come into register with such teeth, respectively, the gaps slide over the teeth and couple the shaft C^1 again to the shaft *C*.

Each gap in one wall of the clutch is, however, as indicated by broken lines, Fig. 3, in such angular relation to the corresponding gap in the other wall of the clutch as to insure that when the gaps in one wall of the clutch have been disengaged from the teeth of the shaft *C*, and the gaps of the other wall have been engaged with such teeth, the shafts *C* and C^1 will be in their relative positions for running the engine in the reverse direction. In the particular arrangement illustrated, each gap of one wall of the clutch *D* is at an angle of 45 deg. with the corresponding gap of the other wall.

MANUFACTURERS' MERCHANDISING

The Farm Tractor Instruction Book

Send It in the Period Between Purchase of Tractor and Its Delivery—Use a Series of Letters to Sell the Book to the Farmer

Part I

H. L. THOMSON of the Moline Plow Co. gave some of the best advice that has been offered to the automotive industry in many months when he told his story of what a good instruction book should contain before the S. A. E. tractor engineers at their tractor dinner in Kansas City last week.

The worst trouble of the instruction book for a tractor, and the same can be said with regard to an automobile or a motor truck, is that it gets to the purchaser of the machine at the wrong time and in the wrong way.

First: It gets to the buyer of the machine in the tool box when the machine is received. This is wrong—the wrong way and the wrong time.

The instruction book should be sent to the buyer between the time the order is placed for the machine and the date when the machine is delivered. That is the psychological time for the job.

There Are Many Reasons

Why? There are many reasons. The buyer has more time to read the book before the machine is delivered. He is anticipating the machine. When it is delivered he will start immediately to use it, and will not have the time to read the instruction book.

Again: Much of the injury done to a tractor is done the first week. Whatever part is neglected in lubrication the neglect is worst the first week. The engine is abused more the first week; in fact, it is not extreme to declare that more injury is done to some machines the first week than in 6 months of service after the farmer has mastered the machine. Help him to master the machine before it gets into his hands.

Further: When delivering the instruction book to the farmer between the time of ordering the tractor and the date of delivery, carry on a kind of correspondence scheme with the farmer. Send out a series of letters.

Letter No. 1.—Send this out a few days before the instruction book is mailed. Tell in the letter how important it is to read the instruction book through and through. It is a part of the tractor. So sell the book to the farmer.

Letter No. 2.—With the second letter forward the instruction book. In this letter draw attention to one part of the tractor and one part of the book. If it has to do with engine lubrication, make the letter a kind of appetizer, so that the farmer will certainly read that part of the book relating to lubrication and will understand it better. Perhaps you can take up carburetion, or draw his attention to it.

State Specific Facts

Letter No. 3.—You may write one, two, or three more letters, according to the length of time elapsing between the date of ordering and the date of delivery. These letters should each deal with some part of the tractor as described in the instruction book. Make each letter relatively brief. Use short sentences. Your letter must do more than just tell the farmer to read pages 10, 11 and 12 on engine oiling. It must state specific facts with regard to your system. It might be you would state: "In our pressure oiling system the oil is pumped to the three bearings of the crank shaft under a pressure as high as 30 lb. The bearings of the crank shaft are so made that this pressure cannot squeeze the oil out before doing its work. There is no oil groove in the bearing that would let the oil be forced out; in fact, the shims are so made as to assist the bushing in holding the oil pressure. This is well told and illustrated on page 11, near the middle of the page."

Mr. Thomson had a lot of other things to say about tractor instruction books, so far as their makeup is concerned. That part of his talk before the Society of Automotive Engineers will be told in AUTOMOTIVE INDUSTRIES next week. After the meeting there were several old tractor makers who declared Mr. Thomson's talk to be one of the best and most practical they had heard for some time.

Intercity Motor Truck Lines

DURING the past few months there has been considerable talk regarding intercity motor trucking. With the increasing effect of rail embargoes, coupled with the fuel shortage, there is no doubt that a great many intercity lines will be established the coming summer. It is expected that in the Middle West, as soon as the roads have become fairly dry, many towns will be connected up by such lines.

The value of this mode of transportation cannot be over-estimated, and the Interstate Commerce Commission should look upon the subject with an open mind and not permit itself to be moved by any previous prejudices against the operation of lines of this sort. It is encouraging to note that the commission has approved the line connecting Toledo, Cleveland, Detroit and Chicago. Recently, when a line was to be opened between Toledo and Detroit, the plan had to be abandoned because of opposition on the part of the commission.

Intercity transportation by motor trucks can be carried on successfully only on an organized basis. A company must be incorporated and it must have sufficient backing to properly finance the undertaking. To start a corporation of this kind going a large amount of investigation is required, and a considerable investment must be made. Once the service is in operation, there is no doubt that it will pay if the management is good. In fact, if the railroads are prevented from carrying freight under 25 miles, or even somewhat greater distances, some other means of transport must take their place, and there is nothing more logical than the motor truck train.

An undertaking of this kind should also have the backing of the local authorities, as it is of the nature of patriotic work, and one of the best kinds of cooperation it could have would be proper road maintenance. The intercity commerce which would be handled by truck lines is of a highly important nature and particularly important as regards moving farm products to nearby cities. These lines, therefore, may be classed as public utilities of the most necessary kind and should be encouraged.

Behind Orders

A YEAR ago we heard reports that factories had on hand large numbers of cars of which they could not dispose. This was not true of a great many companies, yet there were some that had in their storerooms cars awaiting orders from dealers. To-day it is entirely different, and a much more healthy condition, in a way, prevails. Owing to war work and traffic conditions factories have not been able to turn out the number of cars which they would have produced in normal times, with the result that deliveries cannot be made nearly as promptly as dealers desire. The actual purchases of cars throughout the country seem to be very close to what would be expected when it is considered that nearly two million men have been withdrawn from their ordinary positions in life and concentrated in and around the army camps. Add to this the large number of men who have entered other fields of Government work where their usual habits are altogether changed, and you have a condition which is bound to cause a reduction in passenger-car sales. Nevertheless sales have held up remarkably well in nearly all parts of the country. The result is that with the factories turning out large quantities of war work the dealers cannot get as many cars as they desire.

The used-car market is a good index of conditions. The used-car shows held throughout the country indicate that there is a rapid increase in the demand for these cars. They are not only being bought by people for city use, but they are also being purchased by suburbanites who desire to convert them into light trucks to carry their farm products to market.

The larger producing companies have had to reduce their production to a large extent to meet the orders for all sorts of material which have been coming in from the Government. The result is, naturally, that although the product is spread as evenly as possible over the country, in a spirit of

Digitized by Google

fairness to all dealers, manufacturers have not been able to fill the demand.

People who have not heeded the advice of the dealers to buy their cars early are surely going to notice that it is not as easy to get quick delivery on a car as it was a year ago. The spring thaws are going to make drive-away conditions bad for a period of about two months. As a matter of fact, it is far easier to drive a car from the factory to the distributing point in January or February than it is in March and April.

Reviewing the situation, it is now clear how unnecessary it was to urge forced curtailment of production. Reduction in the amount of floor space available and the number of men on the job has cut the output of the factories to about the same extent as the Government would have done had it attempted to effect a reduction by arbitrary means.

Live Axle Tractors

FOR many years it was a familiar saying in automobile engineering circles that live axles were all right for light cars, but would not stand up on heavy vehicles. To-day, however, the great majority of motor trucks have live axles. It took quite some time before the proper materials for gears and shafting, the proper tooth pressure allowance and the best kind of shaft fitting for such axles were determined, and while knowledge concerning these factors was accumulating there was a considerable proportion of failures, especially of axle shafts. At the present time practically nothing but alloy steel, heat treated, is used for axle shafts; the factor of safety allowed is only about two and the wheels and gears are fitted to the shafts by means of splined joints.

The experience thus gained may be made available in the tractor industry. What the maximum torsion in the axle will be can be calculated quite closely from the engine dimensions and the gear reduction. Abnormal shocks due to jamming-in of the clutch may and should be guarded against by limiting the clutch capacity to a moderate excess over the maximum engine torque.

What is probably bothering tractor designers is the enormous dimensions found necessary for the axle parts if cold-rolled stock is used for the shafting and the wheels and gears are keyed on in the usual way. The solution of the problem lies in the use of chrome-nickel steel for the axle shafts and of high-class construction throughout. A final drive by two sets of spur wheels would seem to offer important advantages, as it obviates the heavy end thrust encountered with bevel and worm gears and permits the use of a relatively small differential. This could be combined either with a bevel-gear reduction or with another spur-gear reduction, depending on whether the engine set lengthwise or crosswise of the frame. Worm drive, of course, makes for simplicity, but it is a fact that the efficiency of the worm is at its maximum at speeds far beyond those which could be employed on tractor axles. There is also a well-founded impression that worm gearing will not stand much abuse.

Refinement of Lubricating Systems

A GOOD example of how automobile mechanism is gradually being refined is furnished by the engine lubricating system. We started out with the oil cup on the crankcase, borrowed from stationary practice, and with the variable level splash system, but arrived within a relatively short time at the constant level or circulating splash system. This served satisfactorily for many years, until the maker of an engine of special design, which by reason of its unconventional features consumes considerable oil, introduced the plan of raising the oil level as the load on the engine increased and lowering it with decreasing load. He has since found a number of followers among manufacturers of conventional engines.

In engine lubrication the best practice, of course, is to furnish just enough oil to the bearing surfaces to maintain an oil film between them at all times, but no more. Any excess supply of oil not only results in waste of the lubricant, but also in a smoky exhaust and in carbonized cylinders. At light loads, when the pressures between the bearing surfaces are small, there is little danger of the oil film breaking down even if the feed of oil to the bearing is slow. On the other hand, when the engine is working under substantially full load, the great heat produced tends to reduce the viscosity of the oil, and as at the same time the pressure on the oil film is greatly increased the film is apt to break down, unless it is constantly renewed. With constant level lubrication the level and the size of splashers must be determined to meet maximum load requirements, with the result that at light loads the engine tends to soot up and smoke. These difficulties can be obviated by varying the oil level with the engine load.

Increased engine speeds and the corresponding rise in bearing pressures have led to a more general use of force-feed lubrication. The pressure on the oil is produced by a gear pump, but ordinarily it is maintained constant by a relief valve irrespective of the load on the engine. With constant pressure on the oil the tendency will be to feed at the same rate regardless of the load, and this involves the same disadvantages as the constant-level splash system. One manufacturer has improved upon this constant pressure force-feed system by providing a by-pass valve in the oil feed line, controlled by the suction in the intake manifold and so arranged that when the suction exceeds a certain amount (nearly closed throttle) the pressure is relieved and oil is fed to the bearings by gravity only. This, therefore, constitutes a two-stage oiling system, employing pressure for the normal range of engine operation and gravity for idling.

It would seem a simple matter to provide for gradual variation of the pressure on the oil with variation of engine load. The oil pressure, of course, is determined by the settling of the relief valve. This is a spring-loaded valve and its spring pressure can be varied by connection with the throttle.

First Liberty Planes Shipped

American-Built Battle-Planes On Way to France—Broke Speed and Climbing Records

WASHINGTON, Feb. 21—The first American built battle planes are to-day en route to the front in France. These planes are equipped with the first Liberty airplane engines from machine production. One of them in a recent test, surpassed all records for speed and climbing for planes of battle type.

Engine production which began a month ago is now on a quantity basis and the peak of production will be reached in a few weeks. Only the 12-cylinder type is being manufactured, as developments abroad have made it wise to concentrate on the high powered engine instead of the 8-cylinder one.

This first shipment though not in itself large, marks the final overcoming of many difficulties met in building up this new intricate industry. The great remaining problem is to secure the thousands of skilled mechanics, enginemen, motor repairmen, wood and metal workers and so forth, needed to keep the planes in perfect condition.

Great Mechanical Force

This great engineering and mechanical force at the airdromes, the flying fields, and the repair depots, both here and behind the lines in France, is a vital industrial link in the chain to air supremacy. Without them, the planes turned out are useless and the flyers helpless.

The above statement issued to-day by Secretary of War Baker, is designed to give as complete a picture as permissible, under military requirements, of the progress of our air service.

In reviewing the air problem, Secretary Baker points out that after three years of warfare the total number of planes able to take the air at any one time on either side of the western front, has not been over 2500.

46 Mechanics to a Plane

This combined with the fact that 46 men are required on the ground for every plane in the air, gives a better perspective of European aviation conditions than has been commonly possessed on this side.

Every plane in the air requires two replacement planes on the ground and one training plane for every pilot who eventually reaches the front, with a spare engine for each plane. The first American-made battle planes were not due in France under the original schedule until July.

—

Automobile Men Hear Andrews

WASHINGTON, Feb. 2—Major Barrett Andrews who is here from the French front and served on General Pershing's staff, yesterday addressed a number of the automobile experts of the army forces here and also a number of truck manufacturers on the experiences of the motor transport section abroad. Secrecy was requested regarding the address as a number of military secrets were disclosed.

—

10,000 at Newark Opening

NEWARK, N. J., Feb. 16—Ten thousand persons attended the opening of the tenth annual Newark automobile show at the First Regiment Armory to-night. All the 60,000 sq. ft. of floor space has been reserved by eighty-six exhibitors who are displaying 186 motor vehicles. In this total forty-four makes of passenger cars and twenty-three makes of commercial vehicles are represented. Thirty-four accessory dealers have booths in the balconies.

—

Barlow Joins Moto-Meter

NEW YORK, Feb. 20—A. E. Barlow has been appointed sales manager for the Boyce Moto-Meter Co., Long Island City. He will have full charge of distribution through dealers and jobbers and will make his headquarters at the factory. Barlow was formerly sales manager for the American Ever-Ready Co. and for Findeisen & Kropf, Chicago.

—

Push "Return Load" Work

WASHINGTON, D. C., Feb. 18—The Highway Transport Committee is working out a plan under the "return loads" system to relieve congestion east of the Mississippi River. The plan is to first establish return loads through Boston to Washington, then New York to Buffalo and next Philadelphia to Chicago taking in Cleveland, Detroit, Indianapolis and Cincinnati. At first the aim will be only to hit the large cities, but later it is planned to include the smaller towns also. The committee is working through the Chambers of Commerce of the various cities on the routes, pointing out to them the need of getting together the man with goods to ship and the man with a truck empty or partly filled. Letters are going forward to-day which aim to soon have the system in operation. George P. Wilson, Secretary of Transportation for the Allied Trades Body, Philadelphia, will actively co-operate with the committee.

Much Opposition to Liberty Tractor

Idea Berated at Second Tractor Dinner of S. A. E. in St. Louis

KANSAS CITY, Feb. 14—The 200 who attended the second tractor dinner of the Society of Automotive Engineers at Hotel Baltimore, last night, heard the rumored Liberty tractor generally berated by the entire tractor industry. The Liberty tractor had not a friend present.

A. P. Yerkes of the Department of Agriculture, Washington, D. C., read extracts showing that Washington was opposed to it and that there was not the slightest sentiment there in favor of it. J. B. Bartholomew, president of the Avery company, led the crusade against it, declaring that the rumors already spread were holding up tractor sales, in that farmers were thinking some form of government standardized tractor was coming out and were not going to buy until they had seen it.

Much injury can come to the tractor industry at present by continued circulation of such rumors. The necessity to-day is for tractors such as are being built. There is too great a scarcity of engineers, tool makers, and draftsmen to go into the development of a Liberty tractor. If a Liberty tractor were to be developed by the government the matter should be kept secret, not only until after it was designed, but until it was tested out and found satisfactory and ready to go into production. Otherwise a stopping of tractor sales will ensue.

Dent Parrett, president of the Parrett Tractor Co., in his remarks as toastmaster defined tractor standardization as a commercial investment. A tractor standard to be worth while must save the manufacturer money, and it must also enable him to speed up production. The object of tractor standardization is not to restrict the versatility of the engineer, nor not to dwarf his originality of design, but rather to free him from petty details.

H. L. Thomson of the Moline Plow Co. gave some of the best suggestions regarding tractor instruction books that has been made public. He recommended that tractor manufacturers deliver the book to the buyer in the time between the placing of the order for the tractor and the delivery of the machine; and, further, that in the same period a series of letters be sent to the buyer drawing attention to different uses of the tractor and to those parts of the instruc-

No Alarm Caused by Proclamation of Export and Import Control

Not Intended as Embargo but as Regulatory Measure—Exporters Say Needed Licenses Will Be Issued—Rubber Importers Expect No Harmful Results

NEW YORK, Feb. 16—The President's proclamation taking over control of all exports and imports through a licensing system, is not viewed with great alarm by the automobile industry. The proclamation itself specifically states that it is not to be considered as in the nature of an embargo on either exports or imports, but that it is designed as a regulatory measure pure and simple.

Under the terms of the proclamation, certain products deemed of essential value in winning the war cannot be imported or exported except under license. Where products are vitally necessary to the carrying on of the automobile industry, it is not anticipated that great difficulty will be encountered in obtaining licenses. This applies to imports.

Insofar as exports are concerned, it is pointed out that the industry has been suffering for the want of tonnage for some time, and that such additional restrictions as may be imposed under the terms of the proclamation are not likely to make a great difference. Motor cars and trucks are as essential to the Allies as they are to the United States. Space must be found for them in vessels and the opinion of prominent exporters is that licenses will be forthcoming when and as needed.

One serious aspect of the situation which chiefly concerns exporters is that if it should be decided to limit very strictly the exportation of motor cars and trucks to such countries as South America, South Africa, Australia, etc., a hardship would be imposed because of the virtual severance of business relations which have taken years to build up.

It seems likely that the War Trade Board through its licensing system will, to a certain extent, limit the carrying by ocean-going vessels of certain products which may be termed non-essential; just what this curtailment will amount to cannot be stated at this time.

In general, however, a feeling prevails that the proclamation is in effect a gigantic checking measure with the aid of which it will be possible to efficiencize both American shops and those of her allies.

For example, if foreign governments should request licenses for the importation of great quantities of any one raw material this would indicate to American authorities, who know of present production possibilities abroad, an expansion of facilities with increased production.

This information could, in turn, be used to advantage in perhaps reducing production of similar articles by a certain percentage on this side.

In other words, it would tend to eliminate duplication of effort and promote efficiency in that it would indicate where certain raw materials might be fabricated in the country of their origin to better advantage, perhaps, than in some other country.

Exports of motor cars and trucks reached new high levels in 1917. During the year a total of 65,086 cars and 14,284 trucks were sent over-seas. Though this total of nearly 80,000 vehicles seems a lot, exporters point out that the shipping space required for them is very small when compared with the total number of ships afloat. Allowing about 6 tons, cubic measurement per car or truck, the entire lot could be stowed away in 96 ships of 5000 tons capacity.

Obviously, however, a ship cannot be completely loaded with motor cars or trucks. The space might all be filled, but the carrying capacity would not be reached by a considerable percentage. In this connection, Peter Steenstrup, vice-president of the General Motors Export Co., says:

(*Continued on page* 431)

Approve Present Contract Method

NEW YORK, Feb. 16—That the present method of allotting contracts for military trucks, whereby the government deals directly with the various makers, is the best method and should not be changed, was the concensus of opinion following a joint meeting of directors of the National Automobile Chamber of Commerce and the Motor and Accessory Manufacturers Association Feb. 14. The meeting was called to consider methods of letting such contracts. A unanimous vote of confidence was given Christian Girl for the manner in which he is carrying on his work. The matter of placing more prominently before the public the inherent advantages of motor haulage as a means to help relieve railroad congestion is being considered.

Washington News Letter

President's Proclamation Expected to Influence Pro-Germans—No Restriction of Rubber Imports—Revise Daylight Bill

WASHINGTON, Feb. 19—Automotive industries are vitally concerned with the events in the Capital this past week. The chief object of the import and export proclamations of the President is to prevent the products of the United States reaching Germany and also to influence what is at present pro-Germanism in certain countries to a change of heart by restraining our exports to those countries.

For example, Argentina is at present considered pro-German. Brazil, on the other hand, is friendly to the American policies. Consequently it is unlikely that shipments to Brazil will be curtailed while it is very likely that but few articles will be allowed to be exported to Argentina.

In addition, the proclamations will, according to official announcement, allow for the curtailment of export and import of "non-essentials." For example, certain articles used in this country may be considered non-essential during the war, and if they are dependent upon materials imported from foreign countries, such importations may be curtailed.

The War Trade Board when confronted directly with the question "Will crude rubber for the manufacture of passenger car tires be curtailed in importation?" replied that it considered such tires useful and that it was unlikely that the import of the rubber for tire manufacture would be curtailed.

Another result hoped for from the proclamations is the diversion of material. For example, mahogany is needed for airplane propellers and is instead being used in great quantities for household furniture. By the license plan, the Government expects to prohibit the im-

Digitized by Google

portation of mahogany for household furniture use, thus increasing the amount available for propeller manufacture. Another benefit anticipated through the curtailment of non-essentials is an increase in shipping tonnage available for carrying supplies to France.

It may be definitely stated here that at present there is no specific thought of curtailing the export of automobiles or the import of any materials necessary to the manufacture of automobiles or other automotive products. Officials of the War Trade Board stated, however, that they could not foretell the needs of the next few months, and it is possible that such curtailment may be found necessary for the benefit of the military establishment.

As reported last week, there is a rumor that the automotive activities of the War Department, excepting aviation, will be co-ordinated under one head. At this time there is no reason for changing this view, and in fact it may be said to have been strengthened considerably by additional reports within the past few days.

If this plan is placed in operation it will mean that the purchasing, procurement, maintenance, engineering and all other details regarding trucks for the entire army, including Quartermaster, Ordnance, Signal, Medical and Ambulance Corps, will be done in one office under the supervision of one man.

It is a plan that will abolish a considerable amount of duplication of effort and much confusion that now exists, besides adding to the efficiency of the army by reducing the numbers of kinds of trucks in use with the consequent reduction in the number of parts needed.

The daylight bill as amended last week in the House calls for a shift in working hours from March to October in place of an all-year shift. The amended bill may be considered greatly superior. Detroit, Flint and other Michigan cities operating under an eastern time schedule for more than a year have experienced the inefficiencies of the all-year-round plan. Workers in the winter months in Detroit start in at 7.30, which is really 6.30 central time, the real Detroit zone find the first few hours of the day as dark as night with a consequent slackening of production which affects their efficiency throughout the entire day.

—

Homer-Laughlin Takes Over Langbein

LOS ANGELES, Feb. 20—The auxiliary transmission for Ford cars and trucks, formerly styled Langbein, has been taken over by the Homer-Laughlin Engineers Corp. and will henceforth be styled Laughlin-Langbein auxiliary transmission.

—

Gay on War Trade Board

WASHINGTON, D. C., Feb. 18—E. F. Gay, formerly Dean of the Harvard School of Business Administration, has been appointed to the War Trade Board representing the United States Shipping Board and will devote his attention to import problems and their relation to the conservation of shipping tonnage.

Big Improvement by Railroads

Idle Cars Reduced by 44 Per Cent in Last 12 Days—Coal Moving Freely

NEW YORK, Feb. 20—The railroads are in a better condition at present than they have been for a long time past. During the period between Feb. 6 and Feb. 19, congestion of cars on lines East of the Mississippi was reduced by 44.2 per cent.

In other words, there has been a reduction of 71,130 cars of the total number above normal that were standing idle on the tracks on Feb. 6. For the last week the situation has shown continued improvement and the mild weather has assisted greatly in moving cars. The peak of railroad congestion was reached the first week in February.

Reports made yesterday by eastern railroads give in detail the number of cars above normal on their tracks. These are cars which are stalled, side-tracked, unduly delayed or held up for any reason, and, therefore, represent an excess above that number which would be the normal flowing traffic. This is the measure of railroad congestion. The following table shows the number of cars above normal on eastern roads, Feb. 6 and Feb. 19:

	Feb. 6	Feb. 19
Eastbound loads	59,784	39,257
Eastbound empties	13,345	3,140
Westbound loads	39,841	28,287
Westbound empties	47,934	19,090
Total loads	99,625	67,544
Total empties	61,279	22,230
Grand total	160,904	89,774

The report shows that even in the last 24 hours ending at noon yesterday, there was a gain of 5000 freight cars in relieving congestion. The handling of coal has greatly improved in the last few days. Reports show that the flood danger on the Ohio River is abating, the river falling at Pittsburgh, Parkersburg and Wheeling.

A statement has been issued by the Pennsylvania Railroad in which it is stated that its lines have moved twelve times as much hard coal in the first 18 days of February as in the same period in January. Other freight had also been greatly accelerated. It is expected that the improvement will continue.

—

Truck Inspectors Wanted

WASHINGTON, Feb. 18—Open, competitive examinations for inspectors of military trucks and assistant inspectors of motor vehicles to fill vacancies in the Quartermaster Corps, U. S. Army, and the Ordnance Department at large of the War Department, have been announced by the Civil Service Commission. The duties of the appointees will be in connection with the production of standard military trucks and motor driven-vehicles. In most cases it will require following the raw materials through various processes to the completion of the finished product in the various factories to which appointees may be assigned. Inspectors of trucks will be paid from $1,800 to $2,400 per annum and assistant inspectors $1,200 to $2,000. Certain qualifications are essential and on account of the urgent need of the Government for men in these branches papers will be rated promptly by the Commission.

—

Zinc Prices Fixed

WASHINGTON, Feb. 20—Maximum prices of 12 cents per lb. f.o.b. East St. Louis for Grade "A" zinc, 14 cents for plate zinc, and 15 cents for sheet zinc, f.o.b. plant, have been fixed. This agreement, made by the War Industries Board with the producers, has been approved by the President. It was also agreed that the producers would not reduce the wages now being paid, and that the same prices for zinc would hold in all sales to the Allies, the Government and the public. Furthermore, producers will take all possible steps to prevent the distribution of zinc from becoming a matter of speculation, and will do everything in their power to keep up the production of zinc so as to insure an adequate supply.

—

Chandler Earns $2,382,403

CLEVELAND, Feb. 20—The Chandler Motor Car Co. earned a net profit of $2,382,403 in 1917, a gain of $666,235 over 1916. This was the amount left from a gross income of $3,277,715, which was $843,945 more than 1916. The earnings equal $34 a share on the outstanding stock, compared with $24.50 in 1916. The balance sheet follows:

	1917.	1916.
Land, buildings & equip.	$650,056	$475,062
Good-will	5,000,000	5,000,000
Cash	698,976	1,800,422
U. S. Liberty bonds	279,190	.....
Customers' notes	15,928	14,215
Customers' accounts	101,481	53,181
Creditors' debit balances	28,783	.....
Cars sold for export	192,114	123,287
Merchandise inventory	3,018,742	1,876,985
Invest. in subsidiary co.	35,090	32,000
Advances to manufacturers	35,229	72,867
Miscel. notes and accts.	25,004	.....
Deferred assets	39,011	30,830
Total	$10,119,604	$9,478,849
Liabilities:		
Capital stock	$7,000,000	$7,000,000
Unpaid purchases and exp.	22,349	905,799
Dealers' deposits	97,860	113,928
Dividend payable	210,000	210,000
Accrued taxes	28,334	53,122
Reserves	97,872	5,214
Surplus	2,663,189	1,190,786
Total	$10,119,604	$9,478,849

Much Opposition to Liberty Farm Tractor

(*Continued from page* 422)

tion book relating to these subjects.

Mr. Thomson argued for more simply written instructions, and not the language that one engineer uses when talking to another. The farmer is not familiar with this He does not know its meaning. Blueprints should not be used as the farmer does not understand them, but X-ray wash drawings or pen and ink sketches are advantageous. A good cover should be used so that oil will not soak through or water spoil it. The book should be pocket size, and have incorporated in it complete instructions as to how major tractor repairs should be made, with illustrations of the more difficult steps. It should tell how to take up lower connecting-rod bearings; how to scrape crankshaft bushings; how to take the carbon out of the cylinders; how to grind valves; and how to put in new piston rings. The instruction book thus becomes a real service to the farmer. It should contain large oiling charts, showing how frequently parts should be oiled; there should be carburetion charts explaining adjustments; and there should be valve-timing charts and ignition charts.

Urge Community Tractors

Dean W. M. Jardine of the Kansas State Agricultural College, Manhattan, Kan., argued for community tractors in the eastern part of Kansas, where there are many farmers who could not economically own private tractors, but where one tractor could work for five or six farmers. At present they are opposed to this community system, but the State Council of Defense has Dean Jardine working on the job. He further recommended that tractor makers send one or two of their machines, or as many as they can spare, into the state for spring plowing and announced that the State Council of Defense will arrange to secure land which can be plowed at a good price per acre. A further recommendation was that tractor dealers use their demonstrating machines for contract plowing at a stipulated price per acre, the State Council of Defense securing the land to be plowed.

Kansas has to plant 24,000,000 acres of crops this spring and has approximately 70,000 fewer farm laborers than a year ago. Tractors must be used for the work. In the hot month of July over 9,000,000 acres must be plowed for winter wheat, because land plowed in July generally yields a 50 per cent increase in crop. There is scarcely any other part of the country where the tractor is more needed than in the winter wheat belt of Kansas. The weather is too hot for the horse and often the ground is too hard. Kansas has at present 6000 tractors, 2000 of which were sold last year. Tractors are needed for the 35,000,000 acres that Kansas has to harvest this year.

The 10-20 tractor is the average size used in the state.

Use Laboratory for Tractor Tests

Manufacturers Taking Advantage of Purdue Offer of Scientific Facilities

KANSAS CITY, Feb. 18—Professor G. A. Young, in charge of mechanical engineering and testing at Purdue University, Lafayette, Ind., speaking before the S. A. E. tractor engineers here, outlined the broad plans of Purdue for testing farm tractors. The university is the official testing laboratory for railway apparatus, and new designs of brake shoes, air brakes, draft gears, etc., must take the Purdue test before they may be placed on the market.

Professor Young offered his great testing laboratory for the use of tractor makers and manufacturers of engines for tractors. The testing laboratory that is ready for tractor testing is larger than the entire building housing the tractor show here, where there are displays of 43 tractor makers and more than that number of makers of accessories and apparatus.

The equipment of the laboratory includes a Diehl electric dynamometer testing outfit and there are 2600 hp. of steam power available for tractor testing work and in addition 400 hp. generated for testing uses by gasoline engines.

The Purdue aim, in so far as tractors are concerned, is to bring out by test information as to the designs of tractors which are theoretically right, those practically right and those commercially right.

In all tests a general standard will be followed and adhered to, so that information will have a permanent value and can be used for comparison years hence. The engines will be tested for power on standard gasoline and also on any special fuel that the maker may desire. The complete tractor will be tested in the field for drawbar pull, etc. In the engine test every necessary record will be taken, such as air velocity for cooling, water temperatures, oil temperatures, fuel efficiency, power output, torque, etc.

Already some tractor makers have decided to send their machines to Purdue to have them tested and some engine makers are also going to take advantage of the offer that Purdue has made.

—

Will Help Road Building

WASHINGTON, D. C., Feb. 18—Director McAdoo of the United States Railroad Administration has notified C. P. Coleman, Chairman of the Executive Committee of the American Association of State Highway Associations that the U. S. Railroad Administration will cooperate with the Secretary of Agriculture by transporting materials for the construction of national highways designated by him as military or economic necessities whenever the equipment is available and not needed to move supplies for the Army, Navy and the Shipping Board.

Michigan College Will Train Tractor Operators

LANSING, MICH., Feb. 18—A school which will train men for the 1918 food drive by teaching them the operation of farm tractors will be conducted here by the Michigan Agricultural College from March 4 to 16, with Prof. H. H. Musselman in charge. This training camp is for men who expect to use these tractors, or would like to fit themselves for such service on Michigan farms in 1918. Candidates for the course should report at the college on March 4 and enroll in the department of farm mechanics for the special tractor, as if they were regular students. A dozen engines, both steam and gas, will be used in the work.

—

Predict Demand for Industrial Labor

DETROIT, Feb. 18—If predictions are realized, there will be an active demand for all kinds of industrial labor in this city within the next 30 or 40 days. It is expected that within this time the factories now in the course of construction will have their machinery placed and be ready for production.

—

$9,726,873 Increase in Michigan Deposits

LANSING, MICH., Feb. 18—Figures supplied by Banking Commissioner Frank W. Merrick show an increase of $9,726,873 in deposits of the 512 Michigan banks from Nov. 20 to Dec. 31, 1917. The increase in commercial deposits was the greatest, being $8,672,118; the additional sum of $1,034,754 went into savings accounts. Commercial loans and discounts showed an increase of $5,576,453, while savings loans and discounts reveal a decrease of $2,653,647; commercial bonds and mortgages a decrease of $2,253,912, and savings bonds and mortgages a decrease of $634,455. This, however, still indicates an increase of $44,437 in all sorts of loans over the same period the year before. Michigan state banks and trust companies maintained on Dec. 31 a total reserve of $126,454,725.95, which was 21.75 per cent of the total deposits.

—

Chandler to Make Tractors for Government

DETROIT, Feb. 20—The Chandler Motor Car Co. has received a large contract for the manufacture of tractors for the government. It is estimated that the contract amounts to $10,000,000 or more and it is understood that the tractor will be a heavy duty type to be furnished to the Allies by the United States. A large addition is to be made to the present plant and it is expected that the filling of the contract will require several years. At the same time work has been started on the million dollar factory building for the Cleveland Tractor Co. and it is expected that another tractor concern headed by George T. Comey, with whom are associated J. J. Tracey as chief engineer and Harry L. Lance as general manager, will acquire a plant in Cleveland within a few days. It will manufacture the J. T. creeper type tractor.

Thaw Brings Cheer to Detroit Factories

Relief of Coal Situation and Production Increase Result—Anderson Electric, Maxwell and Dodge Brothers Concentrating on Government Work

DETROIT, Feb. 16—One of the most important developments of the week here and in vicinity is the effect of the thaw. This has tended to open the roads westward, so that drive-aways are starting again from nearly all the factories. Up to this week the only gateway out of Michigan was by way of Detroit and Toledo, and this was only kept open due to the continual passage of trains of trucks for the government, followed by drive-aways of commercial cars and passenger cars.

The coal situation has also been relieved by the thaw, and general production is on the increase.

The Anderson Electric Car Co. is doing a considerable amount of government work at the present time, particularly on trucks No. 1 and No. 2, government specifications. They are also making electrical industrial trucks for the government. The passenger car output at the present time is about ten a day. They report business very good, particularly throughout the East, and excellent in Washington, where they have sold 125 cars during the past year.

The Cadillac Motor Car Co. is experiencing difficulty in shipping cars, due to freight congestion. They require from thirty to forty freight cars a day, but have been only able to secure ten or twelve a week. They are driving all eastern deliveries away, but it is impossible to drive west at present. They report automobile labor plentiful and are having no difficulty in getting all they need.

All the government work done by the Cadillac company is carried on in a separate plant, and regular production is not interfered with. They are scheduled to begin building Liberty engines in May or June.

The production of Maxwell tractors and the proposed large capacity Maxwell truck is being held up pending the arrangement of the factory to take care of government work. There is a great amount of government work coming into the Maxwell-Chalmers plant resulting in the rearrangement of production to a considerable extent.

The inability of the Commerce Motor Truck Co. to deliver cars or to secure freight cars is responsible for the great curtailment of the output of this company. They are now manufacturing six cars a day, whereas the output to fill orders would be fifteen per day.

The production of Dodge Brothers from the beginning of the concern to date is 225,000 cars. Production is not being curtailed at the present time, although work on war contracts has been started. They are unable to get enough freight cars to make deliveries, and drive-aways have been cut down owing to the impassable condition of the roads in the West. However, drive-aways through Toledo and points East and South are going ahead without delay, and it is also possible to reach all points North.

The Republic Truck Co. has increased its production to eighty commercial cars a day, indicating that the manufacture of war trucks is not interfering materially with regular production.

The Hudson Motor Car Co. has received a contract for 2000 Nash trucks from the government. The Paige Motor Car Co., the Premier Motor Car Co. and the National Motor Vehicle Co. will each make a similar number.

The Federal Motor Truck has received a second order for several hundred 3-ton chassis for the signal corps. The first order, which was also for several hundred trucks, has been completed. The monthly production of the company is about 300, about 60 per cent of which is of the 2- and 3½-ton capacity, and the other 40 per cent quite evenly divided among the 1-, 1½- and 5-ton trucks. At the present time the company is driving away about thirty-six trucks a week to Cleveland, Indianapolis and Toledo, the moderate weather facilitating these drive-aways. They report business very good all over the country.

—

Williams Heads Highway Industries Association

WASHINGTON, D. C., Feb. 18—The Highway Industries Association held a meeting here Saturday and elected the following officers and directors: President, S. N. Williams, sales manager of the Garfield Motor Truck Co.; first vice-president, A. R. Hirst, Wisconsin State Highway Engineer; second vice-president, E. J. Mehren, McGraw-Hill Publishing Co.; third vice-president, S. T. Henry, Allied Construction and Machinery Corporation. Directors include Windsor T. White, White Company, Cleveland, representing the motor truck industry through the N. A. C. C.; William E. Metzger, Columbia Motor Company, representing the motor car industry through the N. A. C. C.; W. O. Rutherford, sales manager B. F. Goodrich Company, representing the Motor and Accessory Manufacturers' Association; A. N. Johnson, Portland Cement Association; W. P. Blair, National Paving Brick Association; A. P. Sandles, National Crushed Stone Association; H. J. Love, National Stone Association; S. J. Morrison, National Association Asphalt Block Manufacturers; E. G. Sutton, National Association, Sand and Gravel Producers, and S. T. Batty, National Association Road Machinery Manufacturers. An executive committee was appointed, including Williams, Hirst, Mehren, Henry, Johnson, Blair, Sandles, White and Rutherford.

The association which now represents industries valued close to three billion dollars and employing 1,500,000 men will now devote its efforts to the location of Washington offices' after which it will get down to active business.

—

Would Employ Alien Enemies

WASHINGTON, D. C., Feb. 18—A bill now before the Committee on Military affairs introduced by Congressman Moore of Indiana provides for the employment of all interned enemy aliens either as agricultural laborers or for public highway construction.

—

New Steel Plant Begins Operation

FULTON, N. Y., Feb. 16—The Heroult electric plant of the Fulton Steel Corp. has begun operations and is turning out alloy steels of different kinds, including nickel chromium, ball bearing, magnet and other steels. One of the chief products will be high-speed tool steel of the Great Bear brand, the invention of Irving R. Valentine, metallurgist of the company, who was formerly connected with the General Electric Co.

—

Paige May Buy Signal Truck

DETROIT, Feb. 18—The Paige-Detroit Motor Car Co. has made an offer to the Signal Motor Truck Co. to buy its entire business and assets. The offer only awaits ratification of the Signal stockholders, which will probably be given at the meeting to be held about Feb. 20. Owners of the preferred stock of the Signal company would be entitled to the full amount, provided it does not exceed $106 a share with accrued dividends.

The amount offered has not been made public. C. P. King and W. K. Hoagland, voting trustees of the Signal, say that it would be sufficient to pay all debts and equals the company's sound assets.

—

Hinkley Making Army Truck Engines

DETROIT, Feb. 18—The Hinkley Motors Corp., which was one of the first local companies to receive a government contract for engines for army trucks, is now filling this order. The capacity of the plant is from 40 to 50 army truck engines a day, and production is gaining rapidly.

—

Lozier Commissioned a Major

WASHINGTON, Feb. 19—Harry Lozier, former president of Lozier Bros. Co., Cleveland, and founder of the old Lozier Motor Car Co., has been commissioned a major in the Procurement Division of the Ordnance Department.

—

New Perlman Factory Near Completion

JACKSON, MICH., Feb. 18—Machinery is now being installed in the new building erected by the Perlman Rim Corp. to replace the one destroyed by fire last month, and the building is being rushed to completion. It is expected that everything will be ready for production next week.

Army Truck Service Pooled in France

Major Andrews, Assistant Chief of Motor Transport Section, Says New Efficiency System Eliminates Waste, Red Tape and Duplication of Effort

By Allen Sinsheimer

WASHINGTON, D. C., Feb. 15—Contrary to general impression, there is very little cross-country driving necessary in France. Trucks, more trucks and still more trucks are the requirements of the American Expeditionary Forces. Greater standardization by makers of small parts on trucks, combined with more simplicity and less elaborate design, is the demand of our army abroad.

These and many other interesting and important observations were made here to-day by Major Barrett Andrews, assistant chief in charge of operations of the Motor Transport Service under Colonel Francis S. Pope, with the American Expeditionary Forces in France. Major Andrews, serving directly at General Pershing's headquarters, is in this country for a brief stay, giving to army officers here the benefit of the experiences of our army abroad.

Of particular importance is his message that all of the motor service of the American army abroad has been pooled excepting the aviation trucks, and is now entirely under the direction of Brig. Gen. H. F. Rogers, Chief Quartermaster Corps, A. E. F., who operates directly under General Pershing. General Rogers has so organized the motor transport service as to completely eliminate waste, duplication of effort, red tape, and loss of time, and with the result that there is a saving of 15 to 25 per cent of truck service.

For example, under the pooling system, if the trucks of the Engineer Corps are idle, they can under the scheme be used by the artillery for hauling ammunition, or if the trucks of the artillery are idle they may be used by the Quartermaster Corps for carrying supplies, while under the old system whereby each corps controlled its own trucks, they could not be used by the various other divisions without considerable red tape, and frequently not at all.

French Roads in Good Condition

The popular opinion in this country that the roads of France are destroyed and that all driving is across country is entirely untrue, stated Major Andrews. The roads of France are maintained at a very high standard. Old trucks and old truck bodies are used for road work. The Singalese are detailed in crews much like the section gang of the American railroad plan, and are stationed at intervals along the highways.

The trucks carry crushed rock to the stations of the road crews and to other points along the highway, working on certain schedules, and the workers operating usually directly after the roads have been shelled make their repairs promptly. In some instances they work while under shell fire.

Motor trucks carry supplies and ammunition within 1200 yards of the front line trenches. The preference in motor trucks by the expeditionary forces, as expressed by Major Andrews, is for 3-ton and 5-ton trucks with the regular war body. The reasons are that the

MAJOR BARRETT ANDREWS
Assistant Chief of Motor Transport Service in France

regular body is more adaptable and under the pooling scheme is really necessary, as the trucks are constantly used for diversified work. And the desire for 3 and 5-ton trucks is expressed by the fact that General Rogers believes it better to have many supplies moving along slowly but steadily rather than the limited supplies that could be hauled by the speedier and smaller trucks. The highways are divided for use so that the trucks take the outside while the passenger cars take the center, and the space is limited, thus further making the less speedy and larger trucks more desirable.

Standardization is found particularly important at every turn. Requirements for the military trucks include power, light traction effort, four speed transmission, great strength of all transmitting members, security by use of double ignition, extra lights with minimum of exposure, bumpers front and rear, means of towing, and in general all qualities that stand for sturdiness and durability.

The advantages of standardization, is the message from across the ocean, are so apparent that no argument should be necessary. It begins with the manufacturer, includes the furnishing of spare parts, making of repairs, familiarity of all concerned with the type.

The advantages in making repairs in the shops and in the fields are incalculable, and the reduction in tonnage required to carry over sets of spare parts for standardized trucks instead of for many different kinds is of the greatest importance in its dimensions.

General Rogers includes in his duties as Chief of Motor Transport Service procurement, maintenance, technical supervision and all repairs, except as applied to aviation trucks. Cars are districted throughout the field according to their make to insure a sort of standardization of parts for each district, thus avoiding the waste that would be created by haphazard distribution of the many different makes of trucks.

Large Supply Depot

The plan of maintenance includes a large supply depot in central France far from the front, where a huge stock of parts is kept, and which is so situated as to have excellent railroad facilities and a large repair shop close by which will be the main repair shop with a capacity of 1200 trucks per month.

Four types of repair shops will operate in all. There will be assembly at the base repair shop, a factory to do work requiring two to three weeks' work at a point nicknamed "Central Park," semi-mobile repair shops operating 15 to 30 miles from the front lines on the jobs requiring several days of work, and the field repair shops working close to the front lines and making adjustable repairs.

Spare parts are distributed on two plans, salvage and exchange. The salvage includes the return of all metal and other materials to the big center depot where there will be a salvage department, and the exchange system includes the return wherever possible of damaged and ruined parts such as magnetos before the new parts are issued. Of course this scheme is pliable, working only to insure as much saving as possible and never interfering with the highest efficiency which demands in emergencies the quickest action.

Catalogs have been compiled, one showing the parts peculiar to each make of truck, and the other combining the parts common to all trucks. There are approximately 1800 important common parts. The factory numbers of the special parts have been continued in use in the catalog and thus it is simple to order a part that has been ruined, since all the driver has to do is to use the factory number on the injured part.

All parts are ordered by drivers through the commanding officer of the division, by requisition, but orders is-

Digitized by Google

sued by General Pershing and General Rogers have eliminated the written requisition at the front, thus doing away with the time lost by the red tape and allowing for prompt work when it is needed.

The majority of the trucks are provided with permanent tops, the drivers being afforded every possible protection by the tops, special windshields and large goggles, because of the dust which has been found extremely thick all through the fighting territory. There are two men, both expert drivers, attached to each truck, and, according to Major Andrews, the drivers of motor trucks are the most popular men in the army, since they are the carriers of food, ammunition, bedding and clothing.

Troops are marched on foot only to an extent necessary to keep them fit and whenever possible are moved from point to point by motor truck. Cooking for troop and truck companies being moved overland is now accomplished in rolling kitchens arranged on trucks.

The difference between the repair work of the French army and the American army, stated Major Andrews, is the difference between hand work and machine work, for the French make the majority of their repairs by hand while the American forces are installing complete mechanical equipment to adequately provide for machinery repair.

All Parts Should Be Standardized

Manufacturers in this country will insure considerably greater efficiency for their products if they will turn out their trucks with as many nuts and bolts and other minor parts standardized as is possible. Tires are causing considerable trouble because of the great variation in sizes. And Major Andrews was particularly emphatic in his request that the makers combine to standardize insofar as possible without necessarily affecting design. Simplicity and strength are the two real requisites.

There are none of the many facilities for caring for trucks abroad that exist in this country. During the cold months the radiators had to be drained daily because there was no anti-freeze solution available and at night no heated garages in which to store the trucks.

Gasoline is used conservatively for cleaning purposes because of its scarcity. All of which is mentioned by Major Andrews to illustrate the vast difference between treatment of the machines abroad and here, which is the important reason why makers should give much consideration to making trucks mainly powerful and simple rather than elaborate.

Major Andrews was particularly emphatic in his praise of the present pooling system in use, stating that "pooling of our trucks, cars and motor supplies was the result of General Pershing and General Rogers, who without any red tape used their sound business judgment, of which they both have abundance and have worked out an organization that will enable us to handle the motor transport service of the expeditionary forces with 25 per cent fewer trucks than would be required if they were not pooled."

Motor trucks drive near the front lines without headlights or sidelights, with drivers smoking cigarettes to serve as guides and warning signals.

The American motor trucks have been found the best by all odds, not only in the American army, but in all divisions of the Allied forces and have, according to Major Andrews, motorized the war.

Forty per cent of the passenger cars used in the army have closed tops owing to the heavy dust and the frequent rains. Officers are not allowed to drive their own cars and operate under orders strictly specifying that officers must be ready for duty at all times and must not engage in such duties as will ruin their uniforms.

Repairs to passenger cars is planned along the same lines as with the trucks. Speed along the main roads through which the passenger cars take the middle course leaving the outside to the trucks is limited to 35 or 40 m.p.h., while in the roads near the front lines speed is prohibited above 20 m.p.h., except in cases of emergency.

Great numbers of trucks are needed abroad. In fact, stated Major Andrews, it is not possible to ship too many trucks as they can be used for so many purposes not now allowed because of the numbers.

Two-wheeled type trailers are giving the best results, but all types of trailers are handicapped, according to Major Andrews, because of inadequate design. He stated that the most urgent need was for a self-lubricating towing device, and that there would be great demand for trailers so equipped.

Major Andrews will return to France within a few days, carrying back with him complete details and photographs of the new standardized trucks and of the great work accomplished here for motorizing our army. He could not of course reveal any of the numbers of trucks in use nor the number of men in the motor transport service, but stated that much has been accomplished abroad and that he had every confidence in the present conduct of the military activities of the American Expeditionary Forces.

Government Needs 90,000 Men

Must Be Familiar with Motor Vehicle Work—53,124 Chauffeurs Wanted

WASHINGTON, Feb. 15—The government is in urgent need at present of more than 90,000 trained men familiar with motor vehicle work. The members required in a few of the important divisions follow:

Chauffeurs	53,124
Repairmen	30,900
Magneto repairmen	218
Tire repairmen	156
Truck drivers	465
Motorcycle riders	2,534

This represents but a small fraction of the great armies of trained workmen needed for the army. From the electrical trade alone, approximately 22,443 men are required.

There is a demand for approximately 17,000 radio operators, and 5600 commercial engineers, electrical engineers, and chemists. There is need for 29,400 men including metal workers, general machinists, and tool makers. More than 6000 railroad men and 1800 steam engineers, and approximately 14,400 men for wood work and airplane manufacture are required.

Airplane Mechanics Hard to Get

WASHINGTON, D. C., Feb. 18—The Aviation Service of the Signal Corps finds it difficult to secure suitable airplane mechanics despite the thousands already enrolled. It finds that the average automobile mechanic does not make a good airplane inspector because the work performed on automobile engines is considerably less accurate than on airplanes, the automobile repair training being often a sort of hit or miss system. It was found at one camp that 2500 mechanics enlisted because of automobile training and experience are unsuited to the work. They will probably be transferred to motor truck divisions.

—

Simplify Export Regulations

WASHINGTON, D. C., Feb. 18—The War Trade Board through the Treasury Department has requested collectors to accept shippers' export declarations in lieu of individual licenses for all goods if it is shown that the goods are covered by a bill of lading marked for export or a through export bill of lading provided the bill of lading is prior to Feb. 20 and the goods actually exported by March 15.

This announcement is made to set at rest the fears of export shippers following the President's import and export proclamations of last week. Goods from warehouses or from points near the point of exit will be allowed for export if it is shown that such goods will be exported by March 1.

After March 1 this latter class of merchandise will require individual export license. After March 15 all goods if to be shipped after March 15 with the bill of lading dated after February 19 will require individual license. The War Trade Board requests shippers exporting goods with bill of lading dated prior to Feb. 20 to file application for export license immediately.

—

Keep Civilians Out of Airplanes

WASHINGTON, D. C., Feb. 18—New army orders prohibit all persons from riding in army airplanes other than members and employees, Aviation Section, Signal Corps, officers and enlisted men of the army, navy and marine corps and components in active service, heads of executive and judicial branches of the Government, Senators and Representatives and civilian flyers examined for instructor positions.

Return Loads Bureaus a Great Aid

Connecticut Has 14 Bureaus Listing 700 Trucks—How the Plan Is Working Out

NEW YORK, Feb. 19—The State of Connecticut has formed and has in actual operation to-day, fourteen Return Loads Bureaus in as many cities in the state for the purpose of relieving railroad congestion by acquainting all the shippers in the state of concerns or individuals who have motor truck equipment available for the overland haulage of goods.

This was the message brought by William S. Conning, Chairman of the Committee on Motor Truck Transportation of the Connecticut State Council of National Defense, to the Highway Traffic Assn. of the State of New York at a meeting held to-night in the Automobile Club of America.

Connecticut has assumed the leadership in this work for there is no other state in which a similar system of bureaus has been established. The Return Loads Bureau is a means whereby any shipper desiring to move goods between his own city and any other city may immediately get into communication with either motor truck transportation companies or private individuals owning trucks that are available for this work either on a contract basis or by separate loads.

There has been a great need for bureaus of this kind, which are similar to the return load organizations in Great Britain. Particularly since the acute railroad congestion of the past winter there have been great amounts of goods which could not be shipped by railroad. Some of these goods were finished products to be hauled to shipping points to begin their final shipment to destination, while others have been partly-finished products to be hauled between various manufacturing plants, each of which performed some one or two operations on the goods.

Until the formation of the return loads bureaus in Connecticut, the state's manufacturers were at a loss to know what concerns they could call upon to handle these goods over the roads by motor trucks.

The system has proved a very great success and a very great convenience for the many manufacturers of the State of Connecticut, who have thus been able to move many hundreds of thousands of tons of freight since last winter which otherwise could not have been taken from their shipping room platforms.

Perhaps the most important aid which has been rendered has been the fine cooperation extended by Charles J. Bennett, Connecticut Highway Commissioner, in keeping the Connecticut State roads free of snow during the winter months.

While the great State of New York, which ranks first in the number and value of war contracts, has hesitated in keeping its roads open for the delivery of the many million dollars of goods made in the State, Connecticut has kept its main highways cleared of snow so efficiently that farmers in the rural districts have complained that they could not run their sleighs over the roads because there was not sufficient snow on them. The cost of this snow removal work has been borne out of the funds collected for licenses for both vehicles and operators, and has been performed by a very efficient equipment of motor truck plows, scrapers, horse teams and an efficient organization of Highway Department workmen.

In explaining the development of the Return Loads Bureau idea, Mr. Conning pointed out that the Chambers of Commerce or War Bureaus in each of the cities has undertaken the work patriotically and has even had its telephone number listed a second time under the heading "Return Loads," so that any truck operator arriving in any city in the state in which one of the bureaus was established could immediately get in touch by merely asking the telephone girl for "Return Loads."

He also brought out the fact that the Return Loads Bureaus' main function has been to get the shippers and transportation concerns together, leaving to themselves all questions as to the rates charged, the reliability of the haulage concern and the responsibility on the part of

More than 700 trucks of 1-ton capacity and over are now listed in the fourteen Return Load Bureaus established in as many Connecticut cities. Those cities which have these bureaus now in actual operation are as follows: Bridgeport, Bristol, Danbury, Greenwich, Hartford, Manchester, Meriden, Middletown, New Britain, New Haven, New London, Norwich, Stamford and Waterbury.

The only city which should have such a bureau and which has not yet put one into operation is Norwalk. The routes between the fourteen cities which have established the bureaus number forty-eight. Each of these numbered routes are drawn up on a large map which is posted in the office of each of the bureaus, so that each bureau may know the routes in other parts of the state over which some of the 700 motor trucks now listed are available for overland haulage.

Furthermore, the head of the bureau in each city knows exactly what trucks are available for any other of the forty-seven routes by means of a master file of the cards listing the available trucks for each route. For instance, the bureau in New Haven knows what trucks are available for haulage work between Danbury and Bridgeport or between Hartford, South Manchester or Norwich.

As practically all of the main highway routes are included in the routes listed by the Return Loads Bureau, the system offers a real network of routes to supply practically every one of the manufacturing centers of the state.

Each motor truck listed is placed on a card with the name and address of the owner, the size and capacity of the truck, the kind of goods it can most economically haul and the number of the route over which it operates.

All of the trucks which run on any particular route are given the same route number, and are kept in a file in which the route numbers are arranged numerically. This is a ready means of reference for any route, since each one of the fourteen bureaus are supplied with a complete list of the trucks available on all routes.

Hale & Kilburn Reorganizes

PHILADELPHIA, Feb. 20—The Hale & Kilburn Co. has been reorganized as the Hale-Kilburn Corp. The new money subscribed will be paid in to-morrow, and the certificates of the new corporation are expected to be ready for delivery by March 1.

—

Maibohm Motors Earns $12,294

RACINE, WIS., Feb. 20—The Maibohm Motors Co. shows net earnings of $12,294.17 for the year ending Dec. 31, 1917, equal to 3 per cent of the outstanding stock. The company now has distributers in 26 states as well as export distributers in Norway, Sweden, Denmark, British West Indies, Australia, New Zealand and Tasmania. The balance sheet follows:

Assets.

Cash	$ 15,832.57	
Outstanding drafts on cars in transit, accounts receivable, notes receivable	18,584.84	
Inventories	67,281.46	
Deposits on material	7,071.87	
Deferred to operation	178,225.59	
Machinery and equipment	41,345.40	
Patterns and designs	56,247.28	
Trade marks and good will	50,000.00	
		$434,589.01

Liabilities.

Current invoices and accrued payroll	$ 123.82	
Reserve for war tax on sales	348.90	
Sales contingent fund	1,062.12	
Dealers' deposits	3,050.00	
Capital stock issued and outstanding	417,710.00	
Surplus	12,294.17	
		$434,589.01

—

Lack of Transportation Brings Fuel Oil Shortage

NEW YORK, Feb. 20—Another serious fuel shortage is threatening the industries throughout the East. This time it is a shortage of fuel oil, which is extensively used for the propulsion of ships, in power plants and in industrial processes. Lack of transportation facilities is the chief reason for this shortage, for there is sufficient crude oil at the wells. A large amount of the crude from which the fuel oil is made has come in the past by tank steamers from the Mexican and Texas fields, but these steamers have been commandeered by the Government.

Digitized by Google

On the other hand, the railroad congestion has interfered with the transportation of oil by railroads and it is figured that 63,000 additional tank cars are required to make up for the withdrawal of the tank steamers.

The matter is at present being looked into by the oil division of the Fuel Administration of which M. L. Requa is chief. All consumers have been divided into twelve classes and each class given a priority rating. It is stated that just at present only the first five classes are being supplied. A number of oil men attending the annual convention of the American Institute of Mining Engineers in New York expressed the view that if Mr. Requa were given a free hand he would satisfactorily solve all problems connected with the shortage, as he is a practical oil man.

—

Truck Relays from Akron to Pittsburgh

AKRON, Feb. 16—The Ohio Forwarding Co. has been formed to haul goods by motor truck between Akron, Youngstown, Newcastle and Pittsburgh. It is expected that 50 5-ton trucks will be purchased first, and that this fleet will be increased gradually to 100, as the business warrants. Regular warehouses will be established at each city.

An innovation will be the use of 5-ton trailers on part of the route to reduce the cost of haulage. Furthermore, the trucks will not run straight through from Akron to Youngstown, but special trucks will be sent from Akron to Youngstown, where the roads are fairly level, others from Youngstown to Newcastle, and still others from Newcastle to Pittsburgh.

Loading will take place in the warehouses, by means of demountable bodies, and will take only 3 or 4 minutes.

Record Crowds at K. C. Show

Truck and Car Exhibitors Well Pleased with Amount of Business Done

KANSAS CITY, Feb. 16—The Kansas City motor car show means more to the Southwest this year than it has ever meant before.

Each night the show has been crowded. To those who came the affair had all the earmarks of the preceding hurrah days of big business and growing sales. The man who thought the show might be a fizzle this year found in it a wonderful object lesson. The effect on the public has been good.

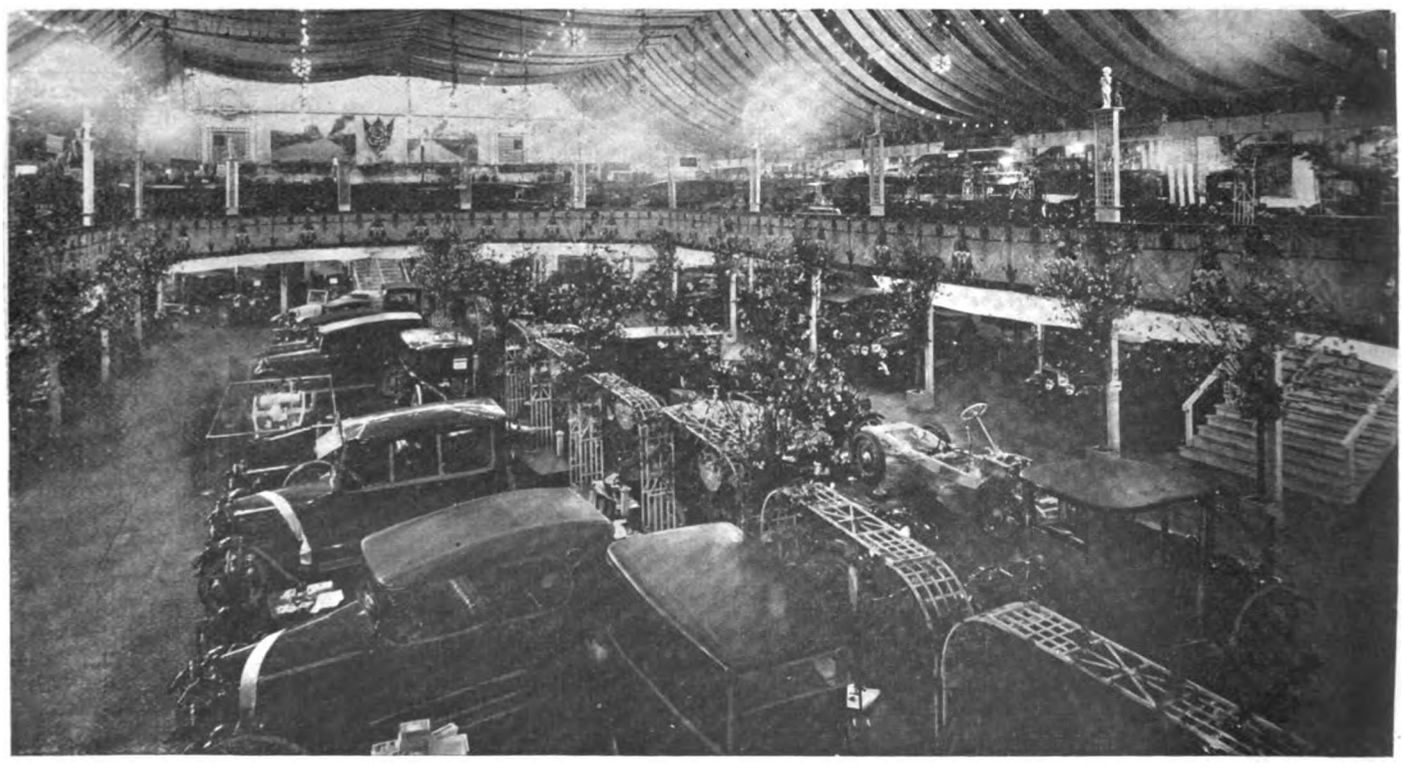
The show is showy. The decorating, by E. W. Campbell of Boston, arranged for by the National Association of Automobile Show Managers, of which Manager E. E. Peake is president, is fine. The show is pretty. The public likes it.

There is an extensive truck exhibit, and all the show publicity lays emphasis upon the business aspect of the passenger car and the economic necessity of the motor truck. The truck exhibitors are well pleased. One big truck deal was made during the show, the Moriarty Motor Co. taking on the Federal.

The show, which for two years has been in the J. I. Case building, is back in Convention Hall. This gives a more showy type of building than the one in the downtown section, but there is about 25 per cent less room. Kansas City, like all other big cities, must solve its show building problem in a permanent way soon. Too many shows have to speculate each year as to where the affair will be held. This uncertainty should be removed and a proper auditorium type building of sufficient size erected in some manner. Kansas City is considering the matter. It could use the building for many things and the town's civic pride should make the task one of not great difficulty.

One or two things exemplify what the show has meant to business. One is that the hotels are packed as never before in their histories—and this is not exaggeration. The Muehlebach began turning down reservations for show week Jan. 4.

The show had a better buying crowd than for several years. This is taken to indicate that the public, influenced by Vanderlipian propaganda, had been holding off and came out of its shell under the influence of the show. Several dealers made real show sales.



Quite a few dealer contracts were signed. Dealers who came in from the territory signed up for both cars and trucks. There is no stampede to the low-priced cars, although they, of course, are centers of interest. But there is money in the Southwest and the farmer who has the money is just as keen for a $2,000 car as his city neighbor.

—

Branch Offices for N. A. D. A.

ST. LOUIS, Feb. 18—The National Automobile Dealers' Assn. will establish branch offices in St. Louis and Washington, each in charge of an assistant secretary. The Washington office will be in the National Automobile Chamber of Commerce Building.

A legislative committee will be appointed for each state to report to the association on pending bills which affect the selling, making or use of cars.

The Kansas City show drew bigger crowds this year than ever before

Text of the President's Export and Import Proclamation

Following is given the text of the Import proclamation, the export proclamation being identical except for the substitution of the word export for import.

WHEREAS Congress has enacted, and the President has on the sixth day of October, 1917, approved, a law which contains the following provisions:

"Whenever during the present war the President shall find that the public safety so requires and shall make proclamation thereof it shall be unlawful to import into the United States from any country named in such proclamation any article or articles mentioned in such proclamation except at such time or times, and under such regulations or orders, and subject to such limitations and exceptions as the President shall prescribe, until otherwise ordered by the President or by Congress: Provided, however, that no preference shall be given to the ports of one State over those of another."

And whereas the President has heretofore by proclamation dated November 28, 1917, declared certain imports in time of war unlawful, and the President now finds that the public safety requires that such proclamation be amended and supplemented in respect to the articles and countries hereinafter mentioned;

Now, therefore, I, Woodrow Wilson, President of the United States of America, do hereby proclaim to all whom it may concern that the public safety requires that the following articles, namely: All kinds of arms, guns, ammunition, and explosives, machines for their manufacture or repair, component parts thereof, materials, or ingredients used in their manufacture, and all articles necessary or convenient for their use; all contrivances for or means of transportation on land or in the water or air, machines used in their manufacture or repair, component parts thereof, materials or ingredients used in their manufacture, and all instruments, articles, and animals necessary or convenient for their use; all means of communication, tools, implements, instruments, equipment, maps, pictures, papers, and other articles, machines, and documents necessary or convenient for carrying on hostile operations; all kinds of fuel, food, foodstuffs, feed, forage, and clothing, and all articles and materials used in their manufacture; all chemicals, drugs, dyestuffs, and tanning materials; cotton, wool, silk, flax, hemp, jute, sisal, and other fibers and manufactures thereof; all earths, clay, glass, sand, stone, and their products; animals of every kind, their products and derivatives; hides, skins, and manufactures thereof; all nonedible animal and vegetable products; all machinery, tools, dies, plates, and apparatus, and materials necessary or convenient for their manufacture; medical, surgical, laboratory, and sanitary supplies and equipment; all metals, minerals, mineral oils, ores, and all derivatives and manufactures thereof; paper pulp, books, and all printed matter, and materials necessary and convenient for their manufacture; rubber, gums, rosins, tars, and waxes, their products, derivatives, and substitutes, and all articles containing them; wood and wood manufactures; coffee, cocoa, tea, and spices; wines, spirits, mineral waters and beverages; and all other articles of any kind whatsoever, shall not, on and after the 16th day of February, in the year 1918, be imported into the United States or its territorial possessions from Abyssinia, Afghanistan, Albania, Argentina, Austria-Hungary, Belgium, her colonies, possessions, and protectorates, Bolivia, Brazil, Bulgaria, China, Chile, Colombia, Costa Rica, Cuba, Denmark, her colonies, possessions, and protectorates, Dominican Republic, Ecuador, Egypt, France, her colonies, possessions, and protectorates, Germany, her colonies, possessions, and protectorates, Great Britain, her colonies, possessions, and protectorates, Greece, Guatamala, Haiti, Honduras, Italy, her colonies, possessions, and protectorates, Japan, Liechtenstein, Liberia, Luxembourg, Mexico, Monaco, Montenegro, Morocco, Nepal, The Netherlands, her colonies, possessions, and protectorates, Nicaragua, Norway, Oman, Panama, Paraguay, Persia, Peru, Portugal, her colonies, possessions, and protectorates, Roumania, Russia, Salvador, San Marino, Serbia, Siam, Spain, her colonies, possessions, and protectorates, Sweden, Switzerland, Turkey, Uruguay, or Venezuela, except under license granted in accordance with regulations or orders, and subject to such limitations and exceptions as have heretofore been, or shall hereafter be, prescribed in pursuance of the powers conferred by said act of October 6, 1917. The said proclamation of November 28, 1917, and paragraph 111 of the Executive order of October 12, 1917, are hereby confirmed and continued and all rules and regulations heretofore made in connection therewith or in pursuance thereof are likewise hereby confirmed and continued and made applicable to this proclamation.

In witness whereof, I have hereunto set my hand and caused the seal of the United States of America to be affixed.

Done in the District of Columbia this 14th day of February, in the year of our Lord one thousand nine hundred and eighteen and of the independence of the United States of America the one hundred and forty-second.

WOODROW WILSON.

By the President:
ROBERT LANSING,
Secretary of State.

No Alarm Over Export-Import Control

(*Continued from page* 423)

"In restricting motor car exports, the following essential facts should be considered:

"1—A certain amount of tonnage employed to carry needed materials to this country offers outgoing space, part of which should be alloted to the motor car industry, as the third largest manufacturing industry in the country.

"2—Boxed motor cars and trucks are known as measurement cargo, of which each ship must have a certain volume to be properly loaded.

3—"The motor car industry, having contributed largely in the sacrifices brought out by the war should be allowed to use part of the tonnage not required for war purposes, especially 'on deck' space and space on sailing vessels.

4—"If any general restrictions in motor car exports are to be made, both past business and pending contracts should be considered when determining the reduction required in the case of each manufacturer.

5—"These restrictions should be arrived at only after due consideration of these facts: viz., the present output of the more important motor car plants is limited entirely by transportation facilities, and the use of motor cars for business purposes in Australia, South America and South Africa, which countries are important sources of raw materials needed to win the war, should be encouraged as a war measure to the extent of tonnage available.

6—"The building up of a trade in motor cars, or any other commodity, in countries outside the United States is a long and tedious business. The only way to hold an export business is to do continuous business. Whereas, in the United States it takes but a few weeks to change dealers, it is a matter of months or even years in the export business before a change of motor car dealers can be satisfactorily worked out.

7—"To discontinue entirely at this time the selling of American motor cars in export territory would break down and disorganize what it has taken years to build up. It is, therefore, essential, if it can be worked out, to permit the shipment of a quantity of motor cars sufficient to keep relations with dealers alive."

Neither rubber importers nor the tire concerns can see grave consequences as a result of the proclamation. The rubber people have been under government control since last December and it is thought that these new regulations will not have great effect.

There is at present a sufficient quantity of rubber on hand, including such as is now afloat, to last for 3 or 4 months. There has been no difficulty in securing licenses to date and none is anticipated.

Most of our rubber comes from British possessions in the Orient, 135,000 tons of the 170,000 tons imported in 1917 coming from such sources. In 1917, rubber imports were 43 per cent greater than in 1916. During the year 1917, a total of 333,373,711 lb. was imported and of this 215,146,375 lb. came from British possessions.

During the same period, tires to the value of $12,330,201 were exported, England being the heaviest buyer with a total of $2,636,654. Canada was next and France third.

The primary and direct intent of the measure is to increase the tonnage available for the shipment of men, supplies and materials essential in the conduct of the war; it is planned that this shall be done by reducing to the minimum the space alloted for the importation and exportation of raw materials and finished products not immediately essential in the conduct of the war.

Looking on the situation from every angle, it appears distinctly more hope-

Digitized by Google

ful than harmful. In the last year, the facilities of the United States for the production of ferro-manganese over which there was the greatest apprehension, have very greatly increased so that our iron and steel producers are practically independent of foreign supplies.

The iron and steel people point out that with a restriction of exports—and it is estimated that between 25 and 40 per cent of our current exports of iron and steel including a considerable quantity regularly licensed by the War Trade Board represents material which might be stopped under existing conditions without embarrassing the prosecution of the war—a corresponding increase in the amount of iron and steel will become available for home consumption.

This is dependent, of course, upon the maintenance of production. At the present time, facilities for production are better than ever before. The railroads are in better condition than for some time and the feeling among the pig iron trade is very buoyant.

That there will be a marked curtailment in the shipment of certain varieties of iron and steel, which during the last 6 months have been exported in large quantities, notwithstanding the license requirement, seems certain.

It is expected that when the full weight of the regulatory measure is felt, the benefits to the railroads will be manifold. In other words, instances have been known, where export licenses have been obtained under what might be broadly styled sharp practice and material has been shipped to the seaboard under priority orders which would not have been given otherwise. It seems likely that railroads will refuse to accept shipments regardless of priority orders unless the shipper can give some adequate guarantee that he will be allowed to export the material offered the railroad for transportation.

This probably will prove a part of the silver lining to the cloud. If exports of raw materials and finished products are to be curtailed, and production is to be maintained, this can only mean an increased supply for home consumption. And if the railroads refuse to accept shipments destined to seaboards, without guarantee of an export license, the transportation channels of the country will be cleared of a certain load and better able to care for present requirements.

—

Nelson Co. to Make Jumbo Trucks

SAGINAW, MICH., Feb. 15—Nelson Brothers Co., of this city, has just formed a separate organization known as the Nelson Motor Truck Co. and has begun the manufacture of a 2½-ton internal-gear-driven truck. It is the intention of the concern to add other sizes to the line.

—

Klingensmith Denies Ford Price Increase

DETROIT, Feb. 19—Despite the fact that dealers all over the country are advertising an increase in the price of Ford cars after March 1, Frank Klingensmith, treasurer of the Ford Motor Co., denies this.

Tractor Men Need 3,000 Cars

Entire Spring Output Crowded in Factories and Yards Awaiting Shipment

KANSAS CITY, Feb. 18—More than 3000 railroad flat cars are needed right now to move the farm tractors that have been ready for several weeks, and remain in tractor factories, where they are so crowded that all available space within the factory is used. In some factories the stored machines are lined up on the streets in front of the building. So acute has the situation become, that some of the tractor factories will have to close within 10 days, if the goods are not moved. One large tractor maker in Indiana, had only twelve freight cars in the month of January to move his tractors away, and he needed 200.

There is not a tractor factory, which is not being handicapped financially by its inability to ship machines. Even small tractor factories have from $100,000 to $200,000 tied up in completed machines that cannot be shipped.

So acute has the car shortage become, that to-day a telegram was forwarded to Secretary McAdoo, asking that consideration be given to tractor makers in the use of railroad cars. There are farmers in southern Texas and other parts of the South who need tractors for farming, but cannot get them. The production of the 1918 crop is already suffering because of lack of machines. Soon the spring will move northward through the great grain belt, and tractors will be needed in increasing quantities. Unless the railroad situation clears up, the spring crop will suffer.

The Avery company, Peoria, has several hundred machines, which have been ready for shipment for a month, crowded into all available storage space in the factory; the yard is filled and street space. Emerson-Brantingham in Minneapolis has its yard filled, and strings of machines on the street in front of the factory.

IF your copy of AUTOMOTIVE INDUSTRIES *does not reach you on the day it usually arrives, wait a day or two before writing about it. It is on the way. These days the railroads are having a hard time and finding it almost impossible to adhere to schedules because of the extraordinary amount of freight which must be handled. Even the United States mails are delayed. The post offices have had hundreds of expert sorters enlist and poor help has taken their places. So wait a few days before you write us that your copy has not been received.*—AUTOMOTIVE INDUSTRIES.

The Minneapolis Steel & Machinery Co., making the Twin City tractor, has its huge factory space filled with completed parts and lacks room for the proper assembly of machines. The Grey Tractor Co. in Minneapolis has its yard filled with tractors crated for France, but lacks railroad facilities to move them.

The Parrett Tractor Co., Chicago, is well situated for shipping and has not suffered to the same extent as others, but has a large quantity of tractors waiting shipment. Rumely, Laporte, Ind., had only twelve freight cars in January and needed more than 200. There is no relief in sight.

—

Urge Use of Box Cars for Tractor Shipments

MINNEAPOLIS, Feb. 19—Tractor manufacturers and farm implements dealers are pushing a plan to persuade the government to allow their products to be shipped in box cars. At present only grain may be shipped in these cars.

About $60,000,000 worth of farm machinery must be sent out before April 15, if it is to arrive at the farms in time for use this spring, and the only solution of the problem of transportation, according to the National Implement Manufacturers' Assn., is the use of box cars for shipment.

—

Maibohm Prices Increased

RACINE, WIS., Feb. 16—The Maibohm Motors Co. will increase the factory prices of all cars shipped after March 15. Two new body styles, four color options and a new upholstery option have been announced.

The price changes are:

Model	New Price	Old Price	Increase
"A" Roadster	$830	$795	$35
"B" 4-passenger Phaeton.....	1050	975	75
"B" Sedan	1650	1375	275

The new styles are a 5-passenger touring body for the Model "B" chassis, to sell for $1,050, and a two-passenger speedster Model "A" to sell for $830. The color options include deep maroon, powder blue, tourist khaki and battleship gray. An option of Spanish or black upholstery is now given.

—

Regal in Receivership

DETROIT, Feb. 19—The Regal Motor Co. has been placed in the hands of a receiver. At a meeting of stockholders held yesterday it was decided to try and resume production in a short time. As soon as an inventory is taken, the creditors will be called together, and it will be decided whether to liquidate or continue. The Securities Trust Co., Detroit, which has been appointed receiver, believes that at the inventory enough assets will be revealed to warrant continued operation.

The assets of the company are $1,500,000, while the liabilities, exclusive of contingent liabilities, amount to only $600,000. It is possible that the receiver may buy the business and maintain it until recapitalization is accomplished.

New Automobile Law for Maryland

Tractors Classified as Motor Vehicles—Higher License Fees—New Speed Limit

BALTIMORE, Feb. 19.—Maryland is going to have a new automobile law, which will make a number of sweeping changes in the present law and also provide for many improvements as a protection to the motorists. The entire law has been rewritten and changes introduced to conform with the modern idea. The bill has been introduced into the Senate of the State Legislature and was prepared by E. Austin Baughman in conference with Osborn I. Yellott, counsel for the A.A.A. and the Auto Club of Maryland, and drafted by the state law department.

Provision is made for the abolishing of the horn traps, which are set up in the rural counties. The definition "motor vehicle" has been enlarged to include tractors and traction engines and vehicles with two or more solid tires. The motor Vehicle Commissioner is also given the power to define any disputed cases. No exemption is granted to anyone to use a motor vehicle in Maryland except state, city, counties, towns, or villages, in section 135.

Fees for motor vehicles have been revised as follows: Class A provides a minimum fee of $10 for pneumatic-tired vehicles instead of $5; Class B, solid tires, is raised from $8 to $12 for vehicles having a rated carrying capacity of not more than 1 ton and the increase is from $6 to $9 for each additional ton; Class C, motorcycles, increased from $3 to $5; Class D, dealers, to $25 for the first two sets of tags, an increase of $5 for each set. Additional sets will cost $12 each instead of $10; Class E, motorcycle dealers, increased from $8 to $20 for the first four sets of tags and $5 instead of $2 for additional tags; Class G (new), trailers, provides $5 for each ton carrying capacity; Class H (new), tractors and tractor engines, flat charge $25. Owners must not furnish their own markers.

Section 143 is changed and provides an age limit of 18 years. Persons learning to operate must obtain a permit for $1, and must also be examined and all future applicants for licenses must be examined. Section 144 provides a fee of $1 for operators of bicycles with motor attachments and the same fee for operators of tractors and traction engines.

Section 145 gives the commissioner broad powers to suspend registration of any vehicle which is so constructed or operated as to cause unreasonable damage to the public highway. The penalties are increased from a minimum of $25 to a minimum of $100 and the maximum of from $100 to $1,000 in addition to imprisonment of from not less than 30 days to one year. The law applies to operator and owner alike.

In Section 149 the speed limit of solid tire vehicles weighing 2 tons or less is reduced to 25 miles maximum, 2 tons and not in excess of 6 tons, 15 miles. Over 6 tons, 12 miles. The existing law allows vehicles over 4 tons and not in excess of 8 tons 15 m.p.h., and those over 8 tons 12 miles. The maximum speed in thickly populated sections for all motor vehicles is 15 miles instead of 12 miles, and outlying sections of communities 18 miles. In the open country reasonable care in the operation of the machine is provided, the driver being the judge in that particular. Penalties for exceeding 60 miles an hour are from $100 to $1,000 or imprisonment of not less than 30 days nor more than one year.

—

Record Crowds at Newark Show

NEWARK, N. J., Feb. 16—The Tenth Annual Newark Show opened to-night in the First Regiment Armory with record crowds attending. The exhibit is being staged by the New Jersey Automobile Exhibition Co. and there are 186 cars exhibited by 86 dealers.

—

Goldman Leaves Studebaker Committee

DETROIT, Feb. 18—Henry Goldman has retired from the executive committee of the Studebaker Corp., but will remain a director of the company. Waddill Catchings, of Goldman, Sachs & Co., will succeed him on the executive committee.

—

To Teach Soldiers in Sweeney School

KANSAS CITY, Feb. 15—The Sweeney Automobile School, which has a regular attendance of 2100, has been requested by the government to assist in teaching enlisted men the internal combustion engine, giving them a complete course of the mechanics necessary for automobile, airplane, motor truck and motorcycle.

The facilities of the Sweeney school are perhaps the most complete of any available for this work. At present the attendance of 2100 represents all except two States in the Union. The number of young farmers who are taking courses in mechanics is rapidly increasing. Eleven hundred and two joined the Sweeney school in the month of January. Seven hundred and ninety-six joined in December and the enrollment in February to date is greater than that for the entire month a year ago. The school is running in two shifts at the present time, and the present building, which was occupied some months ago, is not large enough and an addition to increase the capacity one-third is being started.

—

Canada Buys Ford Tractors

MONTREAL, Feb. 18—The shortage of farm laborers in the Canadian Northwest has caused the Dominion government to help the farmers. A thousand Ford tractors have been purchased, and an option secured on another thousand. These will be sold to farmers at cost plus freight charges, at an average of $800. The Ford company cannot begin delivery before the end of March.

Delay 1918 Tractor Demonstration

Uncertainty of Shipments and Railroad Congestion Cause of Postponement

KANSAS CITY, Feb. 18—The question of definite arrangements for the 1918 tractor demonstrations by the National Implement and Vehicle Assn. has been delayed by the committee which has this work in charge. The committee held a meeting here to-day and decided that because of the congested conditions of the railroads and the uncertainty of securing adequate railroad equipment for shipping tractors, it was impossible to decide definitely on any demonstration. No time nor place for holding such demonstration has been selected yet, although it has been decided to hold a tractor demonstration under rigid rules so that complete information regarding the performances of the different machines can be had and an official report published. If conditions change, and demonstrations are possible they will be held.

It is certain that the demonstrations will not go to Fremont, Neb., this year as they have in past years. Cleveland has been discussed as a probable center for the demonstrations, but it is very questionable if sufficient land can be secured for plowing.

A delegation from Salina, Kan., an enterprising city in the western part of the state, advanced the claims of that area for the tractor demonstrations. It is also understood that some centers of Dakota are anxious to secure the demonstrations. It has been suggested that these demonstrations go to the Twin Cities, but the ground is a little rough and hilly, and it is questionable if necessary acreage could be obtained.

—

Miller Rubber Earns $831,271

AKRON, Feb. 18—Net earnings of $831,271 during 1917 were reported at the annual stockholders' meeting of the Miller Rubber Company held recently. A contemplated stock dividend was passed. The following directors were elected: Jacob S. Pfeiffer, William F. Pfeiffer, Frank B. Theiss, C. T. Grant, and J. M. Doran. Jacob S. Pfeiffer was re-elected president, C. T. Grant vice-president, William F. Pfeiffer, secretary and general manager, and Frank B. Theiss, treasurer.

Buda Exhibits New Tractor Engine

4-Cylinder Kerosene Burning Model—Making 85 Daily at Illinois Factory

CHICAGO, Feb. 18—The Buda Co. exhibited last week at the Kansas City tractor show its new tractor engine designed especially to handle kerosene fuels. The engine is being used in the latest model of Parrett tractor.

The new job model HTU is a Buda design in nearly all particulars, but incorporates a detachable cylinder head, the first design of this kind to come from Buda. This makes it possible to have engines of different compression for high altitude plowing and also admits of many other good features in construction, such as ample waterjacket spaces in the head, more efficient production of castings, and greater ease in removing carbon.

The engine, a 4-cylinder, L-head block, 4½ by 5½, rated at 32 hp. at 1100 r.p.m., has provision on one front motor arm for an electric generator, and on one rear motor arm for an engine starter. Provision is also made for governor mounting.

To make the use of kerosene more efficient, the spark plugs mounted in the cylinder head are specially waterjacketed; the waterjackets extend 1½ in. lower on the cylinder walls than usual; the pistons are a looser fit; they have cross ribs on the under face of the head to aid in heat radiation; the flywheel is nearly double the weight used in former models of the same size; and the crankshaft bearing area is one-third greater, and the crankshaft approximately 25 per cent stronger than former models with the same piston displacement.

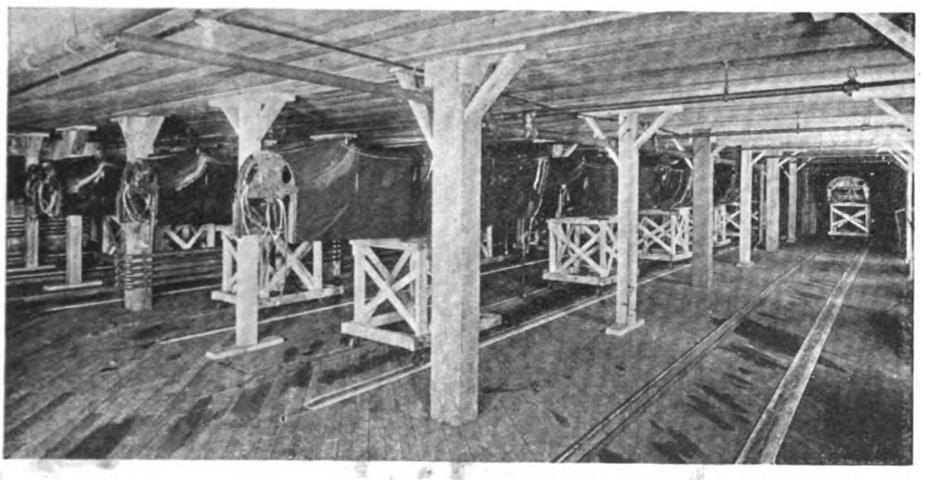
A complete pressure oil system and a cold compression of 65 pounds are used. The engine oil pan is made in two parts, so that the crankcase is really in 3 pieces with horizontal divisions separating them. The object is to have the botton part removable without interfering with the bell housing which encloses the flywheel. It also provides greater accessibility.

The Buda factory in Harvey, a suburb of Chicago, is turning out 85 engines of different models a day, and an addition is being erected to increase capacity. Last fall the company instituted the policy of building only 4-cylinder engines for truck and tractor uses.

$50,000,000 for Tanks

WASHINGTON, D. C., Feb. 18—It became known to-day that fifty million dollars has been appropriated for the purchase of tractor tanks ranging from 12 hp. to 125 hp. The tanks which will be ordered have already been tested by officers of the American and the Allied armies.

New Tractor Engine Developed by Erd Co.



SAGINAW, MICH., Feb. 16—A new Erd tractor engine has been developed by the Erd Motor Co., which will be in production by May or June. The company is erecting a factory addition 404 x 121 ft. that will add 48,000 sq. ft. of floorspace.

This new engine, a 4-cylinder, vertical block design, has the valves carried in the detachable cylinder heads, and the cylinders, 4¾ x 6, are water-jacketed their entire length. The spark plugs are set in a water-jacketed part of the wall. Complete provision is made for fitting starting and lighting equipment and the engine intended for burning kerosene is made robust throughout.

Special attention is given in the pressure oil system, including crankshaft, camshaft and piston pin bearings with oil delivered by pump to the rocker arm for the valves. Specially large bearings are used, the crankshaft bearings being 2½ in. in diameter and the three bearings having a total length of 13½ in.

$277,732,300 for Airplane Bombs

WASHINGTON, D. C., Feb. 18—A bill before Congress calls for appropriation of $277,732,300 for bombs for airplanes.

Factory assembly methods are used by the Pence Automobile Co., Minneapolis Buick distributer. Since last July, 2800 cars have been assembled

Doubles Freight Car Capacity

Minneapolis Company Gets Cars in Parts and Assembles Them in Warehouse

MINNEAPOLIS, Feb. 19—A good example of making one railroad car do what two and one-half previously have been needed to do is found in the Pence Automobile Co., Buick distributer for the four states of Minnesota, North Dakota, South Dakota, and Montana, a territory of approximately 400,000 square miles, or an area practically six times as large as the Boston distributers have in all of the six New England states put together.

Beginning as far back as April, 1917, H. E. Pence discovered that he could not get enough automobiles for his 450 dealers if he relied on shipments by railroad cars, and so decided to begin the assembly of cars in a three-story warehouse that he had in Minneapolis.

This assembly program was carried along slowly, until July, when the 1918 lines started coming through and since than Pence has assembled 2800 Buicks and in the same time has only received 450 by railroad shipments from Flint.

The railroad economy effected by assembling here is indicated by the fact that it is possible to ship the parts for ten Buicks in one 36-ft., small-door railroad car, whereas it was possible to ship only four Buicks in a 40-ft. special railroad car. It is a case of ten cars instead of four in a small railroad car, too small for carrying complete motor cars.

The Pence assembly work is carried on in a three-story brick building 150 by 222 ft. Here twenty-five Buicks per day are assembled by 80 to 100 workmen and when work is at the peak it will be possible to assemble forty cars per day. This warehouse has been converted into a real assembly factory, with special channel metal tracks along the assembly floor to guide the small hand trucks on which the chassis rests while it is progressing along the assembly floor.

The chassis rests on these trucks when it leaves the assembly floor to enter the steam washroom, where all grit and dirt are removed before the chassis pass into the spray paint room where the painting is done, identically as it would be in the factory. From this paint floor the chassis moves into a long three-track drying oven which has capacity for thirty-nine painted chassis at one time. It is a long wood oven, in which atmospheric pressure is used, but provision is being made to use higher temperatures to speed up drying.

On the chassis assembly floor are many other assembly conveniences, such as overhead cranes to pick up the frame and hold it while axles are being fitted, and to turn the frame over and mount it on the assembly truck. There is another crane which swings the engine unit into place at one point on the assembly track.

Digitized by Google

Convenient storage spaces are provided for all parts that enter into the chassis as it progresses.

At present only two models are assembled, the small six and the four-cylinder model and these only in touring car models. Runabouts are not assembled, as it would complicate the stock of parts to be carried and generally render the system more complex. The bodies for the sixes are received in unfinished state and the 450 Pence dealers can secure color options, which were impossible from the Flint factory. This aids very materially in the selling of cars by dealers.

Pence aims constantly to carry on hand parts for two weeks' assembly, which is 300 cars. The shipments from the factory are made in units of 80 six-cylinder cars and 120 four-cylinder jobs. In shipping this material carloads of motors are made up, forty to a car load. Twenty-four bodies are loaded into one car. Other car loads are made up of frames, and others of miscellaneous parts. Everything comes from Flint, with the possible exception of frames, which are shipped direct from the frame factory in Milwaukee.

Of the 100 workmen not one was brought from the Buick factory. There was no difficulty in obtaining workmen in the Twin Cities. They are paid on piece work, and each man has a certain part to do in the assembly chain. If one workman gets behind he holds the line of assembly up, but the operations are so timed that except with a green workman there is no delay. The piece-work plan encourages co-operation among the men and if one workman gets behind, due to breaking of a small part, the others assist him, rather than delay the entire assembly line.

Factory loading and unloading facilities are provided in four railroad spur extensions which are alongside of the factory. There are two loading and two unloading spurs with platforms and all necessary equipment. In the entire assembly scheme nothing is lacking, and the job bears the imprint of permanency. Already some other Buick distributers have bevome interested in the scheme, and it promises to make progress.

Shipping Board Calls for Workers

Several Hundred Thousand Men Needed to Produce Fleet for Food Transportation

WASHINGTON, Feb. 18—The U. S. Shipping Board needs men. Although the immediate requirements have been filled, according to Secretary of Labor William B. Wilson, who last week said that there was no pressing present demand, it is stated that next month there will be an urgent need for several hundred thousand men to work in producing the fleet of ships which is to be used in transporting American muscle and American food for the aid of America's allies.

It is urged that mechanics enroll at once with the nearest agent of the U. S. Public Service Reserve of the Labor Department or with the local enrollment agent of the various State Councils of National Defense. They are instructed to retain their present positions after enrolling until they are notified when and where to apply for work. Chairman Edward N. Hurley of the U. S. Shipping Board, who is also president of the Emergency Fleet Corp., says, "We will require 250,000 skilled mechanics to help the other loyal men now in the yards to build ships so fast that supplies can be furnished to our boys in the trenches who are making the supreme sacrifice for their country."

Men who have had experience in the following lines are particularly needed:

- Acetylene and electrical welders
- Asbestos workers
- Blacksmiths
- Anglesmiths
- Drop-forge men
- Flange turners
- Furnace men
- Boiler makers
- Riveters
- Reamers
- Carpenters
- Ship carpenters
- Dock builders
- Chippers and calkers
- Electrical workers
- Electricians
- Wiremen
- Crane operators
- Foundry workers
- Laborers, all kinds
- Loftsmen
- Template makers
- Machinists and machine hands, all sorts
- Helpers
- Painters
- Plumbers and pipe fitters
- Sheet-metal workers
- Coppersmiths
- Shipfitters
- Structural iron workers
- Riveters
- Erectors
- Bolters up
- Other trades
- Cementers
- Crane men

Another Truck Train Bound for Seaboard

BUFFALO, N. Y., Feb. 18—A convoy of about sixty-five military trucks built by the Pierce-Arrow company for the government will leave Buffalo this week for the Atlantic seaboard. The trucks will be driven by men of the Fourth Supply Train from Camp Greene, N. C., with Captain Jack L. Meyer, quartermaster, in charge. There will be 164 men and six officers in the organization.

—

Standardization in Factory Buildings

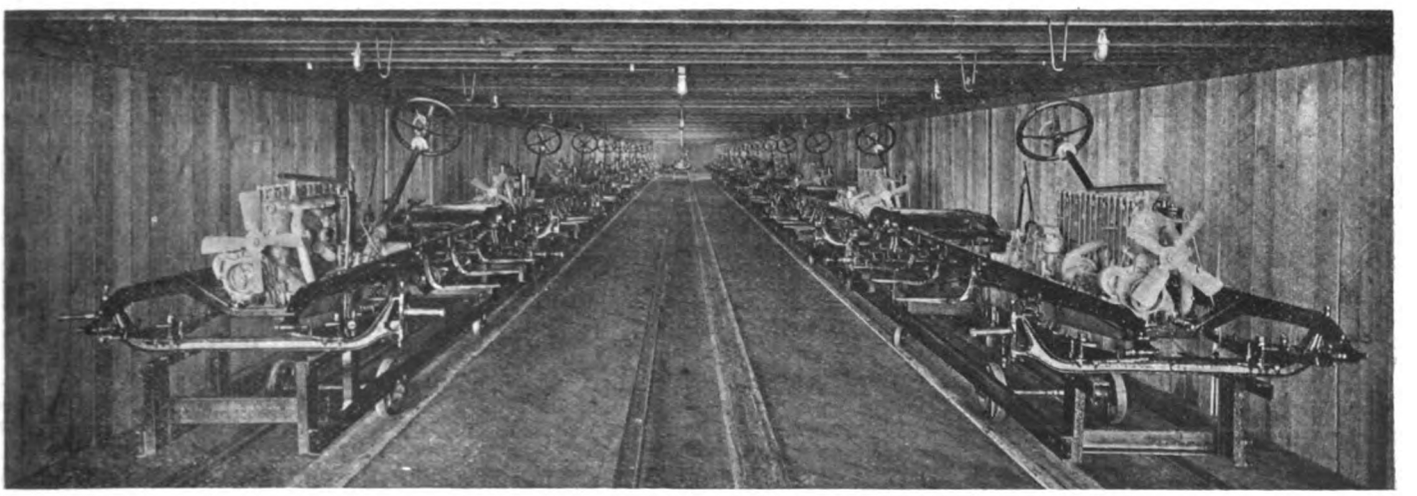
(*Continued from page* 409)

in any number of bays, each 30 by 20 ft. in dimension.

Nos. 5, 6 and 7 are similar, except as to the width of the center aisles, and are suitable for forge shops and foundries.

No. 8 is a multi-story mill type which can be made in any multiple of 16 by 20 ft., and though it is most often built with four stories and basement, it can carry additional stories if desired.

No. 9 is a reinforced concrete multi-story type which can be any multiple of 20 ft. square. A 20 by 20-ft. panel is generally accepted as the most economical in flat slab design, requiring for a given load the minimum of reinforcing steel per square foot.



An example of standardized roof construction is found on the No. 4 type plant for the Nordyke & Marmon Co. at Indianapolis. Pyrobar or gypsum tile was used in 10 ft. length of this structure. The 10-ft. idea meant economy in steel roofing supports. This tile is fireproof, fume-proof and non-condensing, and it affords excellent reflection of light from its white surface.

The Nordyke & Marmon building is 300 ft. square and was constructed with 10 ft. of saw-tooth roof sash every 30 ft.

—

George Batten Dies

NEW YORK, Feb. 17—George Batten, president of the George Batten Co., died yesterday. He organized the company in 1891, and had been one of the main factors in its development.

For chassis assembly work, the Pence Automobile Co., Minneapolis, Buick distributer, uses a moving platform where every workman has a certain duty to perform

Men of the Industry

Changes in Personnel and Position

Three Reo Men Added to Mitchell Company

RACINE, Feb. 18—Three well-known men have been added to the roster of the Mitchell Motors Co. These are: C. W. McDowell, who has been made superintendent of the Four Wheel Drive Division. He was formerly general superintendent of the Reo Motor Truck Co. George W. Kerr, who has been made manager and superintendent of the body plants of the company, was formerly in charge of similar work for the Reo company. C. W. Arthur, who has been made special traveling representative of the company, was also formerly with the Reo company.

—

Bob Lacey has been appointed general sales manager of the Premier Electric Co., Chicago.

—

James A. Harris, Jr., for many years advertising manager of the White Co., Cleveland, has been commissioned a captain in the Quartermaster Corps. He has been assigned to Mechanical Repair Shop Unit No. 305. Millard H. Newton will succeed him in the White Co.

—

Charles Oostdyke has been appointed director of purchases for the Hudson Motor Car Co., Detroit, succeeding A. Barrett. He was formerly purchasing director of the Cadillac Motor Car Co. and later a manufacturers' agent.

—

K. B. MacDonald has been elected vice-president of the Curtiss Engineering Corp., Garden City, N. Y. He was formerly vice-president of the Curtiss Aeroplane & Motors Corp.

—

N. J. Clausen has joined the Curtiss Engineering Corp., Garden City, N. Y. He was formerly a draftsman with the Otis Elevator Co.

—

S. R. Bennett has been promoted to the position of supervisor of the testing departments of the Bosch Magneto Co. He was formerly assistant supervisor.

—

Frank H. Smith has joined the sales forces of the Harry Newman-Stratton Co., Maxwell and Chalmers distributer in Chicago, where he will act as special sales representative in the wholesale department. He formerly was special traveling sales representative for the Studebaker, Lozier, Chalmers and Hal companies.

—

Clark H. Tenant, for many years associated with the iron and steel industry in Milwaukee, has been appointed assistant superintendent of the ordnance plant established at East Moline, Ill., by the Root & Vandevort Co.

—

George N. Graham has been appointed general works manager of the Boone Tire & Rubber Co. He will have charge of both the Chippewa Falls, Wis., and the Sycamore, Ill., factories.

—

J. M. Homs, manager of foreign sales of the Four Wheel Drive Automobile Co., Clintonville, Wis., has resigned to engage in the exporting business in New York. C. S. Thompson will succeed him.

—

F. C. Seeger has been appointed Michigan representative of the Doehler Die-Casting Co., Brooklyn, with headquarters in Detroit.

—

S. E. Knauss has been promoted to the position of assistant-to-the-president of the Harry Newman-Stratton Co., Chicago. He was formerly wholesale representative.

—

M. L. Heminway, formerly sales manager of the Davidson Rubber Co., Boston, has been appointed secretary of the War Service Committee of the Rubber Industry of the U. S. A. His office will be with the Rubber Assn. of America, Inc., 17 Battery Place, New York.

—

Norman G. Wilson has been appointed sales manager of the Philadelphia branch of the Stanley Motor Carriage Co. For the last 2 years he has been in charge of the Bethlehem, Pa., branch of the Packard Motor Car Co.

—

W. H. Oliver, Jr., is now connected with the Taft-Pierce Mfg. Co., Woonsocket, R. I. He was formerly chief engineer of the Hyatt Roller Bearing Co. and recently with the Russel Motor Axle Co.

—

C. W. Price, president of the Auto Devices Co., St. Louis, has resigned, and will head the sales department of the Osgood Lens & Supply Co., Chicago. He will succeed A. C. Fach.

—

O. R. Hardwell, formerly advertising manager of the Chalmers Motor Co., now has Iowa territory for the Willys-Overland Co., for which he is special sales representative.

—

Flechter Co. Appoints Detroit Men

DETROIT, Feb. 15—George K. Parsons has been appointed manager of the Detroit office opened by L. V. Flechter & Co. Frank M. Eldridge, formerly of the Wallace C. Hood Service Bureau, is advertising and publicity manager.

—

R. E. Mills Dies

BLOOMFIELD, N. J., Feb. 18—R. E. Mills, treasurer of the Rajah Auto Supply Co., died suddenly at his home in Montclair, Friday, Feb. 15. It was Mr. Mills who, with his brother, E. B. Mills, founded the present Rajah company seventeen years ago. Mr. Mills was buried at his old home in Canada.

New Companies Formed

Latest additions to ranks of Automotive Industries

Marvel Tractor Co. Ready to Incorporate

COLUMBUS, OHIO, Feb. 18—The Marvel Tractor Co., which has been doing business at 70 North High Street, will be incorporated soon and plans are now being prepared for the erection of a new factory. The Marvel Tractor has been exhaustively tried and found to be successful in many kinds of farm work. For the time being the tractors are being manufactured at the plant of the Jaeger Machine Co., Dublin Avenue.

—

COLUMBUS, OHIO, Feb. 18—J. A. Baker has organized the Baker Automobile Top Co., which has opened a factory at Poplar and High Streets for the manufacture of several kinds of automobile tops. Associated with him are W. L. Moehl and John Windnagel, Columbus.

—

NEWARK, Feb. 18—The Hammered Piston Ring Co., which was recently incorporated in Maryland with a capital of $1,400,000, has purchased the plant of the American Piston Ring Co. of New Jersey.

—

OSHKOSH, WIS., Feb. 18—The Wisconsin Duplex Auto Co., organized a year ago with $500,000 capital by William A. Besserdich, one of the original members of the present Four Wheel Drive Automobile Co., Clintonville, Wis., has completed all details of its organization as an Oshkosh concern. At the annual meeting held here the board of directors was reorganized to give Oshkosh capital full representation. Officers were elected as follows: President W. A. Besserdich; vice-president, H. F. Landeck; secretary, B. A. Mosling; treasurer, J. P. Mosling; director, W. G. Maxcy.

The company has taken over the plant of the J. L. Clark Carriage Co., Oshkosh, and will install new machinery and equipment at once. It will concentrate on a 1-ton truck chassis employing an improved quadruple drive transmission system designed and patented by Besserdich. Arrangements are being made to have the chassis in production by March 15 or April 1.

—

Clyde Cars Earns $41,259

CLYDE, OHIO, Feb. 16—The Clyde Cars Co., manufacturer of the Clydesdale motor trucks, had sales of $1,331,045.91 during 1917. After deducting costs, expenses and taxes, a balance of $41,259.64 was carried to the surplus account. A stock dividend of 12 per cent was declared to stock of record Feb. 4.

Wire Wheel Corp. Gets $650,000 Shell Contract

NEW YORK, Feb. 18—The Wire Wheel Corp. of America has received a government contract for machining shells aggregating $650,000. Under the terms of the contract, there will be no outlay required for material, as the government will furnish and deliver forgings to the plants. This work will be done at the company's Springfield factory, while the Buffalo plant will take care of the wire wheel business.

Earnings of the company, for the first 4 months after its organization in November, 1916, averaged $100,000 a month, but for the eight months from April to November, 1917, averaged only $69,050, the total for the period being $552,407.

—

24,000,000 Champion Plugs in 1917

TOLEDO, Feb. 16—The Champion Spark Plug Co. manufactured 24,000,000 spark plugs during 1917. This is 4,000,000 more than the goal set by the company at the beginning of the year. December was the most productive month with a total of 2,500,000 plugs.

The company intends doubling its capacity during 1918.

—

Boone Factories Finished

CHIPPEWA FALLS, WIS., Feb. 18—The new factory buildings of the Boone Tire & Rubber Co. have been completed, but delays in delivery of equipment make capacity operation impossible for the time being.

—

Falls Motors Gets Government Contract

SHEBOYGAN FALLS, WIS., Feb. 18—The Falls Motors Corp. has received a government contract for 2000 motive power units for military trucks, deliveries to begin early in March. On completion of the order, additional contracts will be placed, which will require the operation of the plant at maximum capacity until the summer of 1919. It is stated that the initial lot of 2000 motors will be shipped to the Kissel Motor Car Co., Hartford, Wis., for use in the government military trucks.

The Falls Co. is now filling a government contract, received some time ago, for cylinders and other parts for 5000 Curtiss airplane engines.

—

Sanford Truck to Increase Capacity

SYRACUSE, Feb. 18—At the annual meeting of the directors of the Sanford Motor Truck Co. it was decided to erect a plant addition which will increase the floor space 50 per cent. This is made necessary by the increase in business, unfilled orders at present amounting to $270,000. The capital will be increased by the addition of $100,000 in cash.

—

Wagon Co. in Troy, Ohio

TROY, OHIO, Feb. 18—In an item which appeared some time ago in AUTOMOTIVE INDUSTRIES it was stated that the Troy Wagon Co. of Piqua, Ohio, had received a contract from the French Government for automobile trailers, etc. The Troy company is located in Troy, Ohio, and not in Piqua as was incorrectly stated.

—

Redwood City Plant for U. S. Aircraft

REDWOOD CITY, CAL., Feb. 18—The United States Aircraft Corp., San Francisco, has bought the plant of the Christopherson Aircraft Co. Extensive improvements will be made and the capacity doubled.

—

New Building for Motor Parts Co.

PHILADELPHIA, Feb. 16—The Motor Parts Co. has moved to a new building at 847 Broad Street, with 25,000 sq. ft. of floorspace. The company recently added an export department to its regular accessories business.

—

To Make 1400 Cars in February

OAKLAND, CAL., Feb. 18—The Chevrolet Co. of California estimates that it will turn out approximately 1400 cars this month. At the beginning of the month there was a total of 1500 cars on order. The company will spend about $1,000,000 in additions and improvements to the present plant.

—

DIVIDENDS DECLARED

The Republic Rubber Co. has declared the regular quarterly dividend of 1¾ per cent on preferred stock, payable April 1, to stockholders of record March 9.

The Michigan Stamping Co. has declared the regular monthly dividend of 1 per cent payable March 1 to stock of record Feb. 15.

The Four Wheel Drive Automobile Co. has declared a stock dividend of 50 per cent. The capital will be increased from $1,000,000 to $1,500,000 at once.

—

Capital Increases

MILWAUKEE, Feb. 18—The Clum Mfg. Co., manufacturing motor car and electrical specialties, stampings, etc., has increased its capital stock from $10,000 to $100,000 to accommodate its increased business and provide for expansion. The plant is located at 23-27 Erie Street. Arthur Denniston is president.

—

NEW YORK, Feb. 18—The Hurlburt Motor Truck Co. is issuing $500,000 worth of 3-year 7 per cent sinking fund gold notes to provide additional working capital. The Hurlburt schedule for 1918 provides for the manufacture of 1800 trucks.

New Reliance Factory Being Built at Appleton

APPLETON, WIS., Feb. 18—The Reliance Motor Truck Co., formerly the Racine Motor Truck Co., Racine, broke ground to-day for the first unit of its new motor truck manufacturing plant, to be 75 x 300 ft. in size, of brick, steel and concrete construction, one story high. The building alone will cost about $30,000 and the equipment an additional $25,000. Contracts call for the completion of construction work on May 15.

—

Metz Concentrates on Government Work

WALTHAM, MASS., Feb. 18—The Metz Co. has sold two of its buildings and will concentrate much of its activities on government contracts in a new building which has just been erected. Although the company will curtail materially its output of cars, it plans to maintain a service of supplying parts for all Metz cars now in use or to be produced for the present season.

—

Piston Ring Insures Employees

MUSKEGON, Feb. 16—The Piston Ring Co. has arranged with the Aetna Life Insurance Co. to take out life insurance covering the 350 men in its employ. Every man will be insured for $500, regardless of the length of time he has been with the company, and $100 will be added annually until the maximum of $1,000 is reached. The company will pay all premiums. When a man leaves or is discharged, the policy will be cancelled. A $500 policy will be given to each new employee.

—

Flechter to Establish Carbureter Service

LONG ISLAND CITY, N. Y., Feb. 18—L. V. Flechter & Co. is planning to establish service stations for their carbureters in all the large cities of the United States. The Neptune Motor Co., of Chicago, Cincinnati, Portland and Los Angeles; Alex Brunner & Son, Newark, N. J., and Burts Supply Agency, Atlantic City, N. J., have already been named to handle service in their respective districts.

—

Omaha Factory for Brictson Mfg. Co.

OMAHA, Feb. 16—The Brictson Mfg. Co. has purchased a 6½-acre site here and will start the erection of a tire factory and reclaiming plant. There are several buildings on the site, which will be used for storehouses. The company formerly had a factory at Brookings, S. D.

—

Western Rope Buys Mueller Foundry

MILWAUKEE, Feb. 18—The Western Rope & Mfg. Co. with home offices at Tulsa, Okla., and a factory here, has bought the Mueller Foundry Co., Cedarburg, Wis., and will enlarge the plant immediately. The Western company, which manufactures gas engines and apparatus for oil wells, has for some time been buying the entire output of the Mueller foundry.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Domestic Fuel Demand Becomes Less Urgent

The let-up in the urgent demand for domestic fuel has enabled a partial increase in the filling of industrial requirements in some quarters, though conditions in New England are far from favorable. There is still a great scarcity of steam grades, and cities in the interior are in a bad way for fuel, principally anthracite.

The use of bituminous coal has been advocated in many quarters where formerly anthracite had been burned. Some municipalities have practically suspended their smoke ordinances for the time being, the authorities evidently taking the broad viewpoint that it is better to have a little smoke and some heat rather than compel their industries to shut down and their citizens to freeze.

The general freight situation is showing signs of improvement, and another cause for congratulation is that there are not many supply ships being delayed in New York harbor for lack of fuel.

Inadequate car supply, as ever, is the one bugaboo that the operators do not seem to be able to overcome. The United States Geological Survey shows that during the week of Jan. 26 production for the country as a whole amounted to 66.1 per cent of capacity; and the one dominant factor limiting production is car supply. To this cause were ascribed losses amounting to 26.6 per cent of full-time capacity, as against 7.3 per cent for all other causes combined.

Speaking of this order, now a thing of the past, it is universally acknowledged that though it saved little fuel, it helped considerably to relieve freight congestion. No less a person than Secretary McAdoo was against a continuance of the measure, as he feared that to adhere to the plan would seriously affect the taking up of the next Liberty loan.

Dr. Garfield states that there will be no necessity for the shutting down of industry in the future, as he believes it possible henceforth to rely upon embargoes and the preference in the movement of food and fuel.—*Coal Age.*

A New Service

¶ Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

McClaren President of Ajax Rubber Co.

NEW YORK, Feb. 16—H. L. McLaren was elected president of the Ajax Rubber Co. at the annual meeting Wednesday. He is also president of the Racine Rubber Co., Racine, Wis., which is affiliated with the Ajax company. Fred E. Dayton was elected secretary and Stuart Webster vice-president. The retiring directors were re-elected for 3 years, and L. T. Vance and Louis C. Detribats will continue as vice-presidents. Harold W. Stimpson was re-elected treasurer.

The regular quarterly dividend of $1.25 a share, payable March 15, was declared at the meeting.

—

Benoist Equips Temporary Plant

CANTON, OHIO, Feb. 18—The Benoist Aeroplane Co. will not build its new plant before next spring. In the meantime a temporary building is being equipped here.

—

2918 Federal Trucks in 1917

DETROIT, Feb. 18—The Federal Motor Truck Co. manufactured 2918 trucks valued at $6,005,000 in 1917, compared with 2442 valued at $4,261,000 in 1916. At present there are unfilled orders on the books which will total $4,000,000, consisting of 300 foreign orders, 1100

New Goodyear Cushion Tire

AKRON, Feb. 18—The Goodyear Tire & Rubber Co. is placing on the market a new type of cushion tire designed to give economical service for delivery work. The tire has been in preparation for more than two years and in cross section somewhat resembles an inverted Y, having a fabric reinforced double base fitting a clincher-flanged rim. A metal ring around the center holds the double bases of the tire, preventing buckling and eliminating the possibility of twisting or slipping on the rim. The tread has a practical wearing thickness equal to that of similar size solid tires. The tire is made of a specially prepared rubber compound in which are combined great resiliency and toughness.

Harroun to Have Detroit Factory

WAYNE, MICH., Feb. 18—The Harroun Motors Corp. will shortly open a factory branch in Detroit, on automobile row. R. H. Schmittdiel will be manager.

82,120 Men in Aviation Section

WASHINGTON, Feb. 13—In less than a year the Aviation Section of the Signal Corps has shown a remarkable growth. On April 1, 1917, the complete section consisted of 65 officers and 1120 men; on Jan. 1, 1918, there were 3900 officers and 82,120 men.

Michigan Copper Earns $60 a Share

DETROIT, Feb. 18—Net earnings of the Michigan Copper & Brass Co. for the year ending Dec. 31 were $596,819.41, after deduction of $35,000 for income taxes, $136,000 for excess profits taxes and $126,000 for depreciation. This is equal to $60.20 a share on the $991,350 outstanding common stock.

Assets totaled $2,735,532.85, compared with $2,181,827 at the end of 1916. The surplus, after deduction of preferred stock dividends, was $1,434,009.53. Capital stock outstanding was reduced from $1,114,850 to $991,350 through retirement of the preferred stock during the year.

Summary of Business Conditions and Crops Jan. 23, 1918, as Reported From Twelve Federal Reserve Bank Districts

	District No. 1—Boston	District No. 2—New York	District No. 3—Philadelphia	District No. 4—Cleveland	District No. 5—Richmond	District No. 6—Atlanta
General business	Active	Good; retail trade quiet.	Good	Active, limited only by scarcity of supplies.	Large volume	Fair.
Crops:						
Condition			do	Good	Inactive	do.
Outlook			do	do	Extensive preparations anticipated.	do.
Industries of the district.	Turning more towards Government work.	Active, but hampered by transportation and fuel difficulties.	War industries active; other production retarded.	Decreased output by reason of weather and other conditions.	Running full	Handicapped for coal; some labor shortage.
Construction, building, and engineering.	Little new construction except on Government work.	At minimum	Very little activity	Decrease	Private building negligible; Government work in large volume.	Below average.
Foreign trade	Heavy imports of raw material.	Decreased export movement because of traffic congestion.	Somewhat greater		Restricted	Very limited.
Bank clearings	Increased	Decrease	Small increase	Increase	Large volume	Increase.
Money rates	Firm and steady	Firm	Firm	Firm	Good demand at 6 per cent.	Firm.
Railroad, post office, and other receipts.	Post office increased, railroad decreased.	Increased	Heavy; December shows increase.	Post office receipts increased.	Railroad, irregular; post office, volume large.	Good.
Labor conditions	Fair; considerable unrest.	Demand greater than supply.	Scarce and inefficient	Scarcity and exacting.	In demand at high wages.	Fair.
Outlook	Unsettled	Fair	Unsettled	Improving	Generally satisfactory.	Unsettled, account rapid readjustments.
Remarks	Increasing demands for capital purposes and Government financing, scarcity of coal, and transportation difficulties making business hard to conduct.	Course of business and industry during remainder of winter will depend largely on success of efforts to relieve transportation congestion and fuel shortage.	Coal and transportation situation most acute.		General activity above normal for period of year.	

	District No. 7—Chicago	District No. 8—St. Louis	District No. 9—Minneapolis	District No. 10—Kansas City	District No. 11—Dallas	District No. 12—San Francisco
General business	Good	Generally good	Fair for the season	Good	Good	Active.
Crops:						
Condition	do	Fair		Fair	Fair	Prospects bettered by recent rains.
Outlook	Large acreage wheat	Favorable		More favorable	Encouraging	
Industries of the district.	Necessary industries active.	Busy, as a rule	Active	Active	Active	Very active.
Construction, building, and engineering.	Practically at a standstill	Dull	Slow	Declining in volume	Inactive; seasonal for midwinter.	Decreasing.
Foreign trade					Satisfactory	Large increase.
Bank clearings	Decrease	Increase	Up	Nearly 50 per cent increase.	31 per cent increase over December, 1916	Largely increasing.
Money rates	Firm	Firm	Steady	Steady	Easy	Firmer.
Railroad, post office, and other receipts.	Post office receipts normal.	Increase in post office receipts.	No change		Railroad, increase; post office, 41 per cent increase over 1916.	Increasing.
Labor conditions	Generally satisfactory	Labor scarce	Good	Settled with threatened shortage of farm labor.	Generally satisfactory; some unemployment in unskilled trades.	Unsettled.
Outlook	No misgivings	Generally favorable	do	For general increase of all business.	Promising	Favorable.
Remarks				Prevalent coal and car shortage is serious.	Heavy snow and rain have improved crop conditions, especially wheat; retail trade curtailed; general business satisfactory	Deficient precipitation is at present an unfavorable factor.

Aviation Not Extra Hazardous

WASHINGTON, D. C., Feb. 18—Following a report from Gen. Pershing that aviation is not an extra hazardous service, Secretary Baker yesterday submitted to the Senate Military Committee a bill to repeal all extra pay allowances in the aviation service, averaging about 50 per cent. The measure submitted by Secretary Baker will also create a new grade of aviators to be filled by specially qualified civilians at $150 a month.

—

To Watch Over Women Workers

WASHINGTON, Feb. 18—The Ordnance Corps will station women welfare supervisors at every plant where women are engaged in war work, one example being at the plant of the Holt Co., Peoria, Ill.

—

Kincannon Transmission Elects Officers

BOSCOBEL, WIS., Feb. 18—The Kincannon Silent Transmission Co., organized recently at Boscobel, Wis., by George C. Kincannon, designer and patentee of an improved gearset for motor-driven vehicles, has elected the following officers: President, George C. Kincannon; vice-president, Peter Boebel; secretary, Roy Greenfield; treasurer, Richard Black, and director, Dr. C. L. Jones. For the present the company will contract with outside machine shops for castings, gears, bearings and parts, although it will manufacture these in a short time. Several manufacturers are negotiating for the use of the patents, and contracts probably will be made on a royalty basis.

—

Dayton Dealers to Distribute Tractors

DAYTON, Feb. 18—Dayton dealers are preparing to take up the distribution of farm tractors very actively and many of them are at present entering into aggressive campaigns to interest farmers in such equipment.

—

Department to Newark, N. J.

EAST PITTSBURGH, Feb. 18—The Automobile Equipment department of the Westinghouse Electric & Mfg. Co., will on Feb. 15 be removed to the company's Newark, N. J., plant. At the same time the general sales offices of the company will be moved to 110 West Forty-second Street, New York, where the Eastern district sales office will be located. S. D. Levings has resigned as Eastern representative of the company.

—

NEW YORK, Feb. 19—The Bourne Magnetic Truck Co. has moved its factory and offices to Fifth avenue and 142d street.

Many New Plants in Cleveland

CLEVELAND, OHIO, Jan. 17—A marked growth in the automotive industries of this city is shown by the building permits obtained in the past year. The following are several of these, following the extent of the use:

Plant	Location	Estimated Cost
Cleveland Welding & Mfg. Co.,	2145 W. 117th Street	$60,000
Cleveland Welding & Mfg. Co.,	2145 W. 117th Street	40,000
Warner & Swasey Co.,	5701 Cedar Avenue	60,000

The quality of Stanwal is backed up by the most complete manufacturing equipment known to the brake lining industry. The special heat proof yarn is carded and spun under the direction of our own experts. The weaving is done on our special high speed looms which give to the fabric a uniform solidity.

STANWAL
BRAKE LINING
AND CLUTCH FACINGS

Stanwal is made complete in our own factory. This is a fact worth considering for it places a direct responsibility upon us. It compels us to obtain only the highest grade materials and to enforce those standards of workmanship which alone can insure a product of recognized quality.

Digitized by Google

The treatment of Stanwal is another unique and exclusive feature. With such care is it compounded that it makes Stanwal moisture proof and element proof, at the same time giving to the fabric its even, frictional quality.

A rigid system of inspection follows Stanwal through every process of manufacture. In the spinning of the yarn, the weaving, the treating, every foot—every stitch—comes under the watchful eyes of experts.

This thorough system of inspection is a necessary foundation for the guarantee upon which Stanwal is sold.

For we guarantee that every one who uses Stanwal shall be satisfied without regard to cost or loss to us

Tire Values
-and how to judge them-

THESE are days of conservation, a time to make every dollar do its utmost. Some basic information about tire values is opportune. Many different makes of tires are advertised, but in a way rather confusing to car owners. Claims conflict, glittering generalities are the rule. That is why Firestone advertising presents to the public the fundamental principles of good tires, Most Miles per Dollar tires. Below is shown a cross section of a Firestone Cord Tire. This is the tire that is giving car owners the greatest possible efficiency in wear and fuel economy. Each part is briefly described. Inspect the vital units of this construction. You will soon be buying more intelligently, making every dollar do its utmost.

FIRESTONE TIRE AND RUBBER COMPANY
Akron, Ohio Branches and Dealers Everywhere

Tread A touch of your finger tips proves the resilience of a Firestone Cord Tire. And the remarkable mileage of this enduring tread are matters of record in every section of the country.

Cord and Rubber Body Each wall of stout cord in the Firestone Cord Tire acts independently of adjoining cord walls. Firestone construction forms one flexible unit, strong and enduring.

Reinforcement for Sidewall and Bead A special reinforcement that carries the hinge to the widest portion of the tire where the bending action has least effect.

Cushion Stock This section of fine rubber is a shield to the body or "carcass" of the tire. It absorbs road blows. The Firestone method of making it from the purest rubber and of unusual thickness has added materially to its effective performance.

Most Miles per Dollar

Breaker Strip A special open fabric of great strength, filled and coated with pure rubber. Breaker strip spreads road shocks over large area of the cushion and body of tire, preventing stone bruise.

Side Wall Here is the protecting element for the body on each side between tread and bead, a combination of great resilience and resisting power

Piano Wire Bead In every Firestone Cord Tire there is enough piano wire to equip four pianos. This wire is braided into a cable of astonishing strength to form the bead. The bead is the anchorage for the entire structure and must cling firmly to the rim.

Firestone

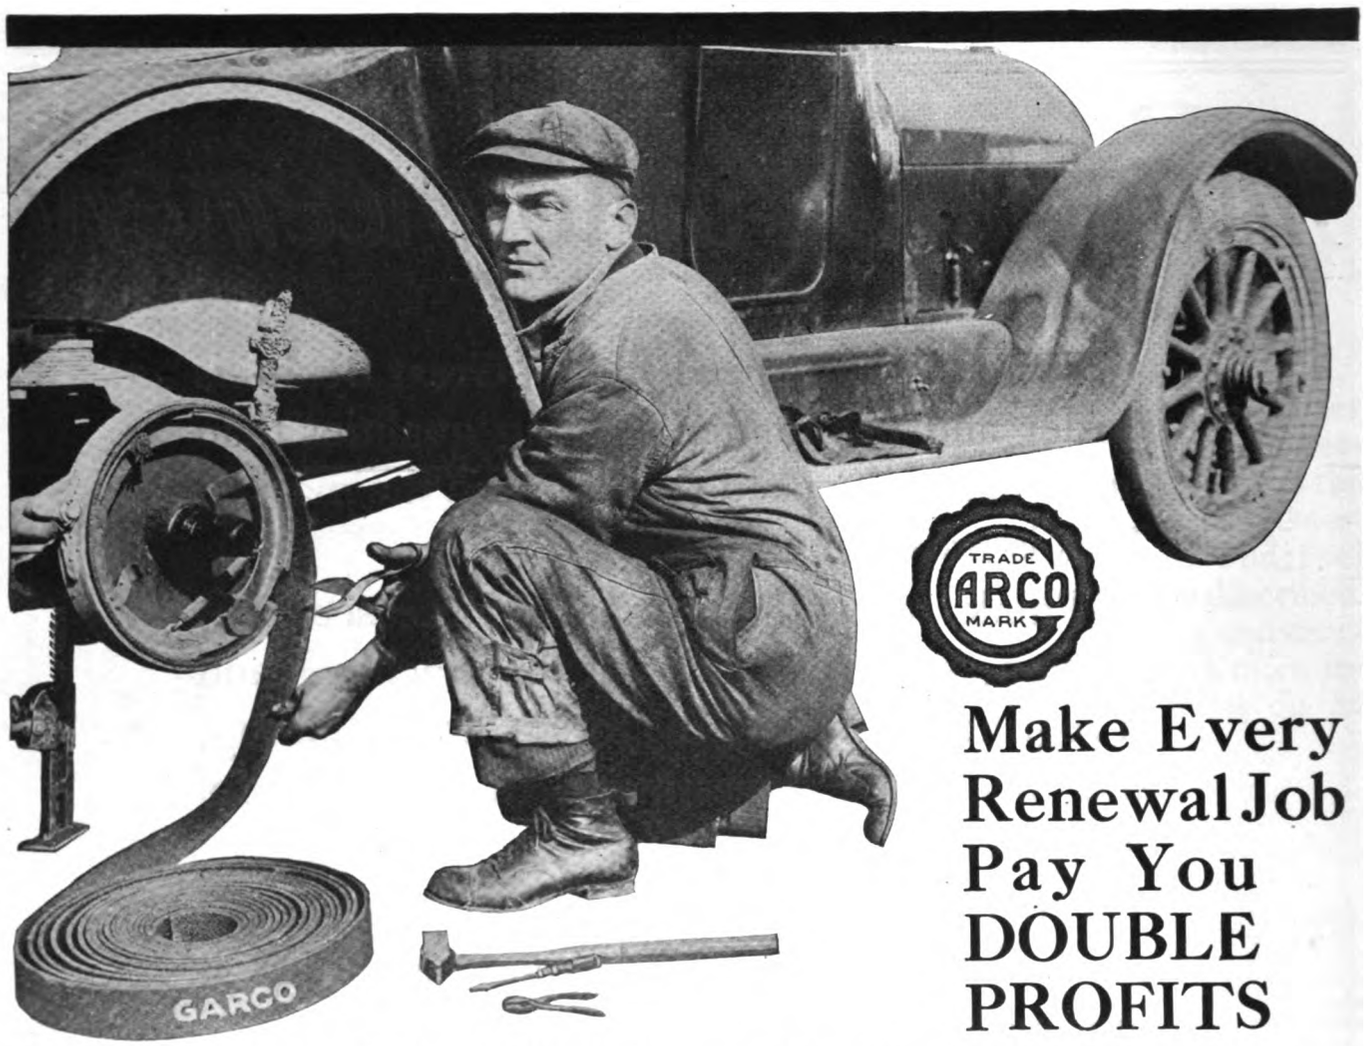
Important Announcement

The new high-speed steel—Great Bear—is harder and has longer wearing qualities than any other high-speed steel now on the market. This is proved by tests.

Think what this means in increased production, saving of labor at the machines and in regrinding; saving in storage and handling, and decreased investment in cutting-tool equipment.



Prove it yourself. Send $1 for sample piece from $\frac{7}{16}$ to $\frac{3}{4}$-inch square, and test it thoroughly in your own plant.

If you desire some other size send us your order for a single piece, or write for further information.

Make Every Renewal Job Pay You DOUBLE PROFITS

MOST any brake lining will bring you a reasonable profit on every renewal job. Some kinds that give the *least wear* even pay the biggest profit. But only *once*.

When your customer leaves the choice of brake lining up to you — use GARCO. It will bring you a mighty good profit right there and then. But more than this—it will build customer-confidence that you can cash-in on time after time.

GARCO is solidly woven. It resists wear. It backs your good workmanship through months of the hardest kinds of service. GARCO puts safety into driving that no other brake lining can give.

Your jobber carries GARCO in stock and will be glad to supply you. Put it up to him the next time you are in the market. Ask him to tell you about the brake lining rack supplied free to every GARCO dealer. Get it selling for you now.

A Machine Shop that Backs up Your Own

Production unable to keep up with orders—a shortage of labor almost unprecedented—wages so high that never before has the worker's time had such a value—

Here is a situation to make you stop and consider whether you are getting the utmost out of every machine and man in your shop.

And here's a situation in which our machine shop can help you do it. How? By taking off your hands a job we're especially fitted to handle and releasing your men and machines for work that your shop is tuned up to do best.

A lot of things that you can do with your machines will pay you better than finishing bushings and bearings or brass castings. And that's but one advantage in turning the job over to us.

Take the matter of borings, for instance. You sell them as scrap and get the price of scrap. We can keep each lot separate, remelt them and realize more on the uniform remelt than you can from mixed scrap.

Thus we are sometimes even able to supply finished *Lynux* at a price below that of rough castings, and almost always for less than the cost of the rough castings plus your machining costs.

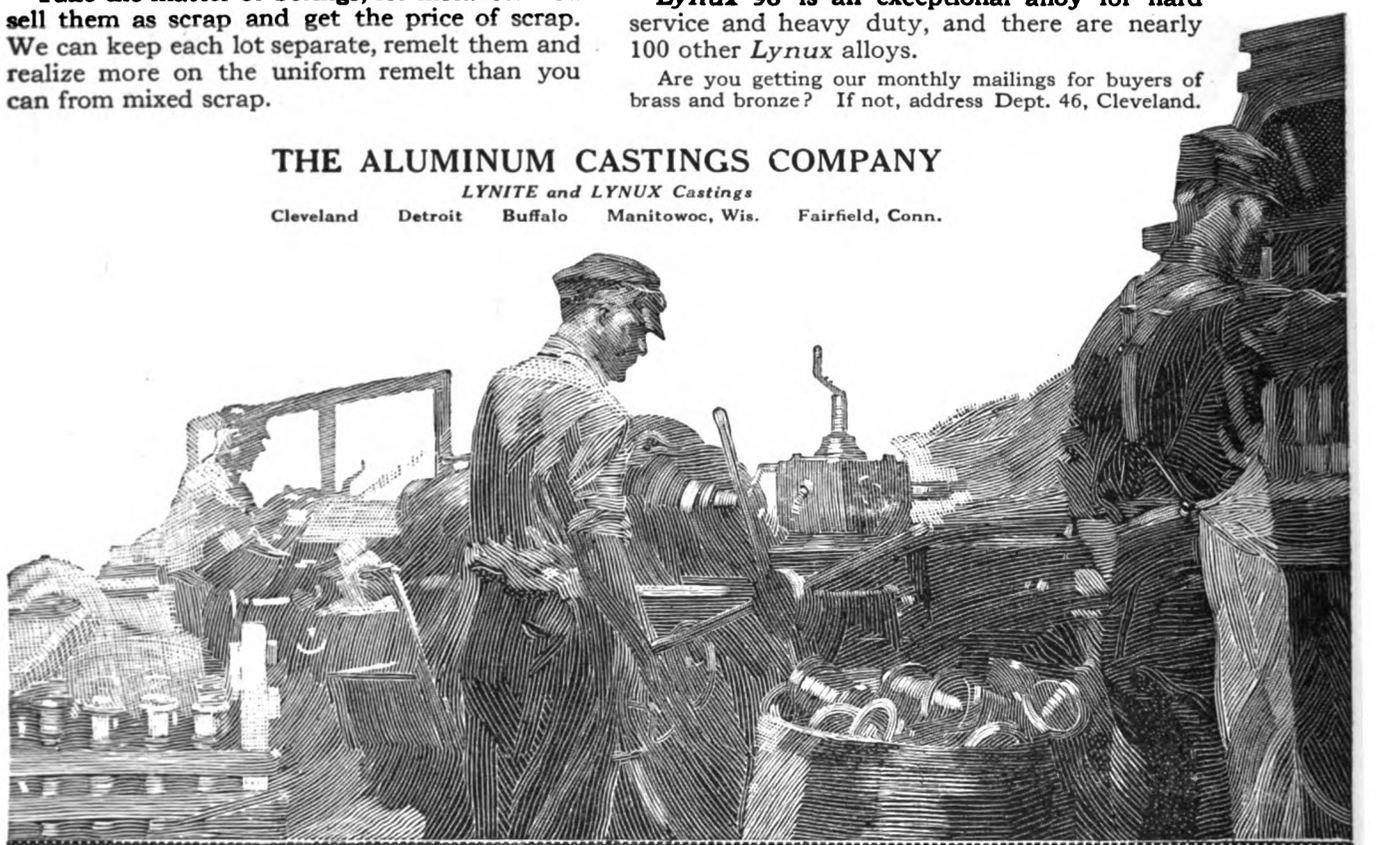
We've Doubled Our Shop Capacity

Our machine shop facilities have always been large. Recent additions have doubled them. Our Detroit plant is now probably the biggest of its kind in the country.

And in our machine shop, the same kind of scientific management and up-to-date methods prevail, as in *Lynux* foundries.

Lynux Alloys for Various Purposes

For bushings, bearings, gears, big castings, little castings—in short, for almost anything in brass or bronze.



Lynux 98 is an exceptional alloy for hard service and heavy duty, and there are nearly 100 other *Lynux* alloys.

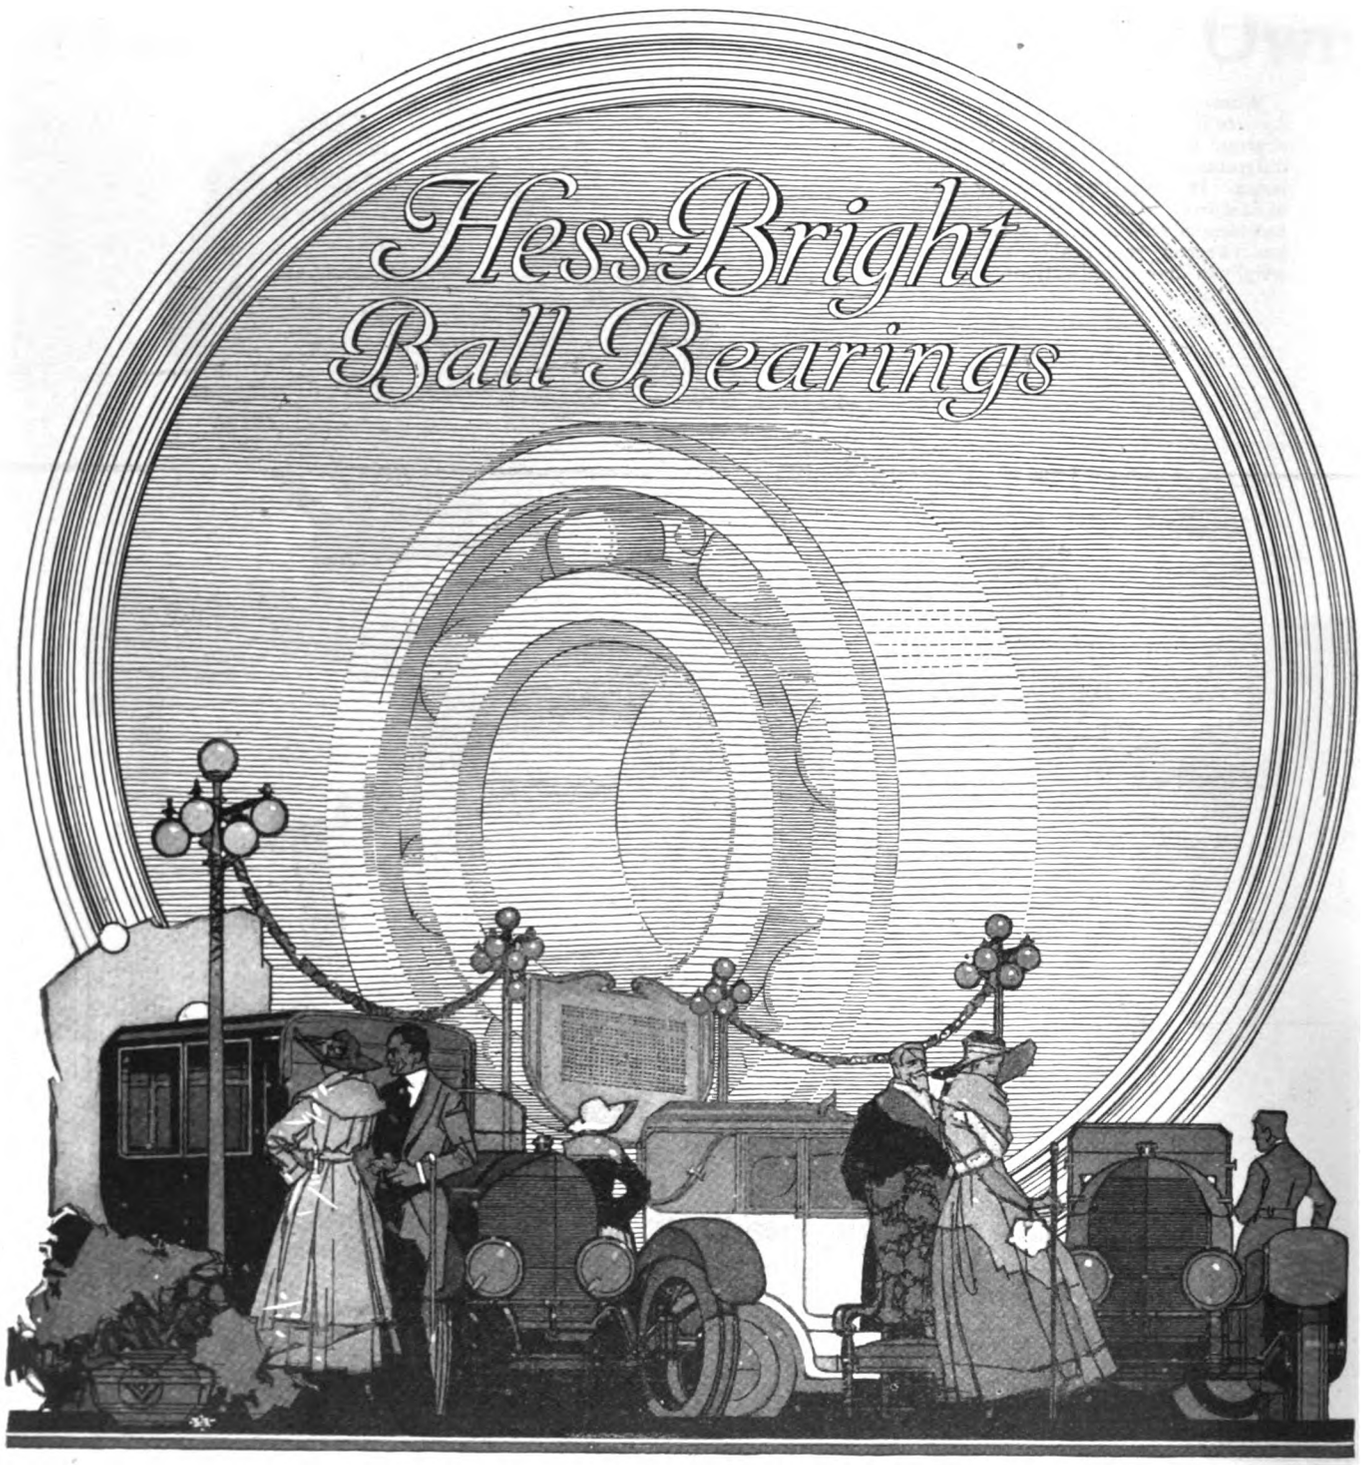
Are you getting our monthly mailings for buyers of brass and bronze? If not, address Dept. 46, Cleveland.

THE ALUMINUM CASTINGS COMPANY

LYNITE and LYNUX Castings

Cleveland Detroit Buffalo Manitowoc, Wis. Fairfield, Conn.

LYNUX BRONZES



Digitized by Google

Where lightness is a requirement, *Lynite* is the ideal metal. *Lynite* is a group of aluminum alloys, made to different analyses for different purposes. It's as strong as many grades of cast-iron, where strength is needed, but weighs only a third as much. It has effected remarkable savings of weight in many applications.

The Magneto Equipped Eight

STANDARD "8"

Digitized by Google

"Magnetos are a Mystery to Me!"

"Electricity isn't in my line. With *all* the makers so strong in their claims how am I to judge which Magneto will give me the best service!"

That is the attitude of many car owners toward the magneto question.

Claims are poor things to judge by; *results* are what count, especially results in competitive tests. And since you cannot easily make the tests for yourself, follow the decision of those car, truck and tractor builders who are most particular to use the best.

Truck service, with its heavy, constant strains and shocks, is where the differences between magnetos show most plainly. In the list of 81 truck builders who use Eisemann as standard equipment appear the names which mean most.

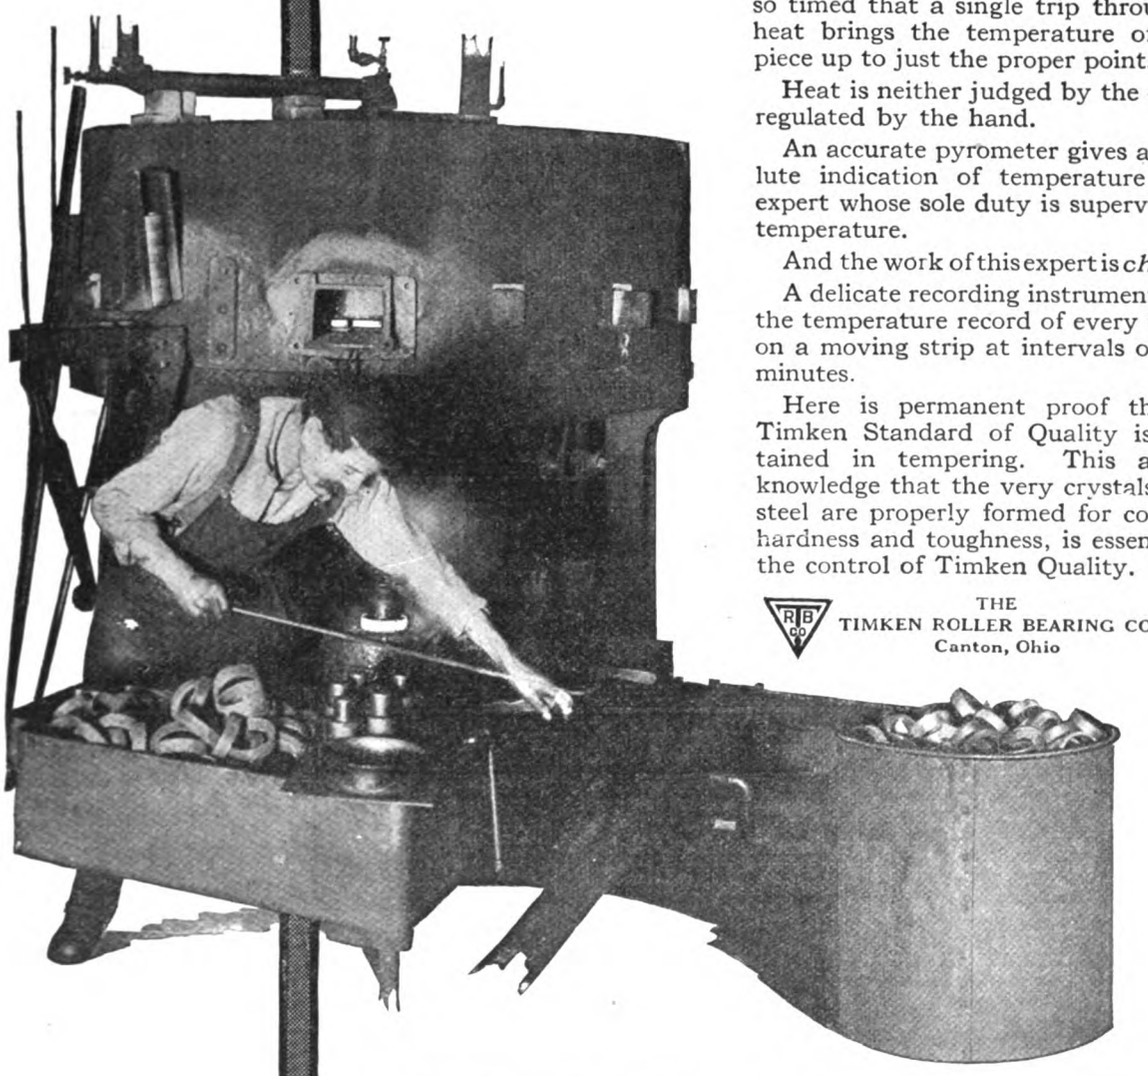
The Control of Quality
Point No. 11

Getting the Third Degree

Cups, cones and rollers of a Timken Bearing are heated to just the right red heat before hardening — and this temperature is automatically regulated.

Motion of the parts in the furnace is so timed that a single trip through the heat brings the temperature of every piece up to just the proper point.

Heat is neither judged by the eye nor regulated by the hand.



An accurate pyrometer gives an absolute indication of temperature to an expert whose sole duty is supervision of temperature.

And the work of this expert is *checked*.

A delicate recording instrument prints the temperature record of every furnace on a moving strip at intervals of a few minutes.

Here is permanent proof that the Timken Standard of Quality is maintained in tempering. This absolute knowledge that the very crystals of the steel are properly formed for combined hardness and toughness, is essential for the control of Timken Quality.

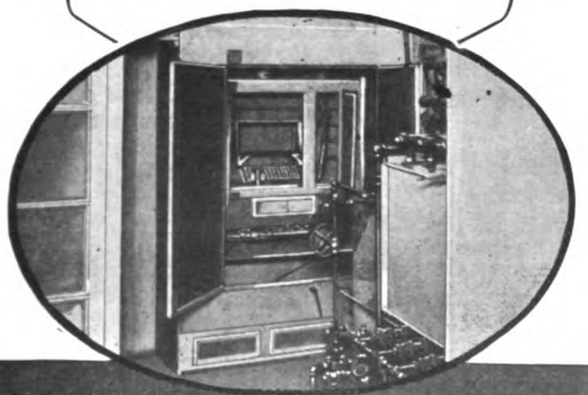
The Tractor Must Withstand Rust and Wear

The Farm Tractor is machinery. It cannot be exposed to all weathers, without sustaining vital injury, unless its finish is of a kind vastly superior to that of ordinary agricultural implements.

Let Us Help You Find a Way

Our "Better-the-Finish" Laboratory is devoted exclusively to the study of finishing problems.



All devices that can aid in such work are here. Actual tests are made under conditions as nearly as possible duplicating those in your own workshops.

Hundreds of different problems, involving a large variety of requirements, have been correctly solved in this Laboratory. It has saved many manufacturers time and labor, and besides has given them exactly the proper finish for their products.

Let us help you find a way to improve your finishing methods—at our expense.

Manufacturers handling government work should bear in mind that our experience in co-operating with firms handling similar work is at their disposal.

The experimental japanning ovens where goods can be baked at temperatures up to 500 F.

Tractor manufacturers who desire a reputation of permanence for their products would do well to consider this fact seriously.

To obtain the proper finish does not mean necessarily to spend more money, but to adopt the proper finishes and methods.

These can be determined in two ways—i. e., by finding them out for yourself at the expense of time, money and numerous failures; or, by consulting those who have already made a thorough study of the subject and can help you to a successful conclusion.

HILO

Enamels—Japans—Varnishes

The "HILO" trademark stands for more than high quality finishes. It stands for "Finishes That Fit The Case!" With 54 year's experience in solving all kinds of finishing problems, and an experimental laboratory constantly devoted to perfecting finishing methods, we stand ready to fill your exact requirements.

Write for our Bulletin No. 1 on Black Enamels and Japans. It will help you, whether you buy from us or not.

Discriminating people want it because it is always dependable

Auto-Lite

Starting, Lighting & Ignition

Dominant in the Automobile Industry

There are many kinds of automobile engines—

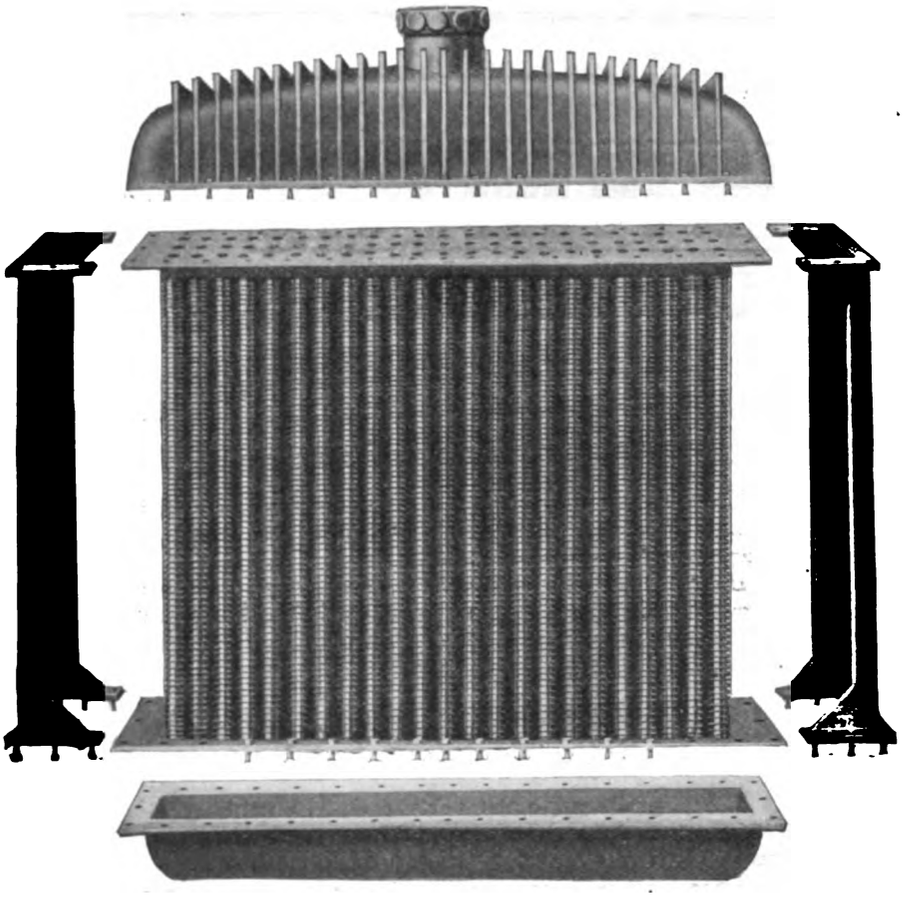
And many varieties of motor cars—

And many different engineering theories—

All the *more* creditable to Auto-Lite that a vast majority of cars are equipped with it.

We originated the six volt principle, separate unit, now accepted as the world's standard for high efficiency.

We specialize upon this one and *only* product.



Because Auto-Lite *is* so superior, the demand has made us the world's largest company devoted exclusively to building electric starting, lighting and ignition systems for motor cars.

Make sure Auto-Lite is on the next car you buy.

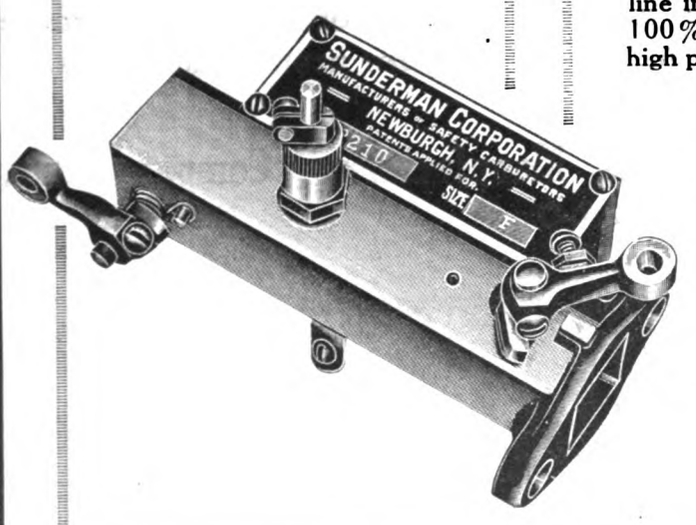
SUNDERMAN
Vacuum Carburetor

$6



F. O. B.
Newburgh

$8 and $10 for other than
FORD or METZ

Help Your Customers to Save

That's your duty, Mr. Dealer. Every Car owner wants to save—you must show them how. The SUNDERMAN CARBURETOR will save for them without sacrificing anything.

Start NOW

Install a Sunderman When You Overhaul Your Car

With the first breath of the spring breeze every owner begins to figure on putting his car in good shape for the new season.

By all means do so this year, Mr. Motorist. New cars will be scarcer than last year and you'll have to do more yourself with the old car to make it run sweetly.

A Sunderman Carburetor Will Do Wonders for You

When you scrape the carbon out of your cylinders, grind the valves and put in new piston rings, **finish the job—install a Sunderman Carburetor.**

Then you will get the final answer to complete motor enjoyment with absolute economy.

More Power at a Lower Cost—More Speed on Less Gasoline

The Sunderman Carburetor works on the soundest, scientific principle—that of breaking up the gasoline globules into infinitely minute particles, thus releasing the power that is bound up in coarser mixtures and lost in the combustion chamber.

The low and high speed jets insure an economical but always adequate supply of quickly explosible gas, governed by the suction of the cylinders.

The result is a saving of from 30 to 50% of gasoline in all motors—a power increase of from 42 to 100%. Think what this means in these days of high prices.

As a by-product you get a greater flexibility—a more rapid acceleration—quicker pick-up—better idling, and an Herculean hill-climbing power that in itself is worth more than the purchase price.

Owners—Ask Your Dealer or Order From Us To-day

Dealers—*We'd much rather have YOU take these profits—Write us, and we'll show you how to cash in on our advertising.*

Sunderman Corporation

It pays to handle "The Best Jack in the World"

The new Peteler Jack, a marvel of mechanical ingenuity, simple as a pocket knife, compact, easy of operation and tremendously powerful—will vitalize your business from the ground up.

Think of it—$6 for the best jack in the world. Well proportioned, finely finished, distinctive in appearance—it will almost sell on looks alone. A brief demonstration proves its genuine capacity for work.

By means of the long telescoping handle it can be shoved into place without crawling under the car or even kneeling.

Its stroke is so short that the overhang of the car cannot interfere with the movement of the handle.

It raises 3/8" to the stroke—much faster than any other jack.

It has no danger point—can be raised to the limit of the lifting bar without fear of failure.

Peteler AUTO JACK

It raises the car easily; a turn of the handle operates a lever which reverses the action and the car comes down—step by step.

When all the load is off—a slight lift of the handle allows the lifting bar to drop the remaining distance—the jack can be withdrawn and stowed away in the tool box.

It is built to raise 3000 lbs.—a half ton of overstrength.

It is built of the finest materials throughout.

$6 for the best jack in the world.

And the price allows you a most liberal profit. Write today.

DRIDEK—

With the Leather Finish

TRADE DRIDEK MARK REG.

DrideK with its leather finish, is an entirely new creation, based on many years' experience in furnishing tops and upholstery for the majority of the cars that have been put on the market.

DrideK looks as well as the best of leather. The distinguishing features in the wear of DrideK are: that you cannot scratch the finish; that it retains its color until entirely worn out; and that it is absolutely waterproof.

The product is unquestionably superior, and the price is within reach of your specifications. Made in black and many attractive colors.

Strangling the Periodicals

Congress at its last session passed a hasty postal law increasing the postage on periodicals from FIFTY TO NINE HUNDRED PER CENT.

Some periodicals will be killed—all will be restricted in circulation and crippled. There will be fewer readers, and the habit of reading curtailed. The great function of periodicals is to assist in the spread of ideas—by printing the achievements in the world of thought, culture, and science.

Thus to shut out farm journals—as these zone rates will—will lessen the productive power of our country by millions of dollars through loss of better methods. Shut off trade journals and you decrease the manufacturing power by more millions. Shut off the religious papers and there are shut off channels that have raised millions of dollars for distressed humanity. Shut off the great periodicals of the home and there is throttled an avenue that has given expert instruction to hundreds of thousands of mothers and saved their babies to health and citizenship.

These national periodicals are printed in the big cities—and the first zone, the cheapest zone, is in or near those cities; there are many educational opportunities near cities, and the cities will read anyway. Small towns and distant districts depend to a large extent upon periodicals; thus this law increasing periodical postage where it is most needed shuts off opportunity where needed. It penalizes periodical readers.

Repeal this law. Repeal this FIFTY TO NINE HUNDRED PER CENT periodical postage increase. Sign the petition below and mail it. Put a cross mark in the square—save the periodicals and the work that they have done and are doing for national education and patriotism.

SIGN BELOW.

CUT OUT. MAIL TO CHARLES JOHNSON POST, Room 1417, 200 FIFTH AVENUE, NEW YORK CITY

PETITION TO CONGRESS—Sign Here!

The spread of education, of culture, of scientific knowledge and advancement, and of our vast internal merchandising and manufacturing has been, and always is, vitally dependent upon the freest and cheapest circulation of periodicals. The penalties resulting from any restriction on the freest possible circulation of periodicals will be destructive of the best interests of our economic life and the opportunities of developing our best citizenship.

The postal amendment passed by the last Congress increasing the postage on periodicals from FIFTY TO NINE HUNDRED PER CENT will throttle or destroy our periodicals at a time when the widest and most extensive circulation of publications is essential to the patriotism, education, and upbuilding of our country.

Therefore, I the undersigned, do most earnestly demand the repeal of this burdensome periodical postage amendment.

Name.....

City or County.....

Street Address.....

State.....

Periodicals mean much in your life. If you will help by a few arguments with your acquaintances and an occasional letter in a spare moment, put a cross mark here.

Will you help in securing the repeal of this iniquitous law? ☐

The Height of Lens Development

THE Dillon Multi-Vision Lens marks a new era in lens performance. Not only is it a radical departure in design, but it is evolutionary in results.

The central bull's-eye, for instance, is an exclusive advantage of the Dillon. This bull's-eye has an important function—that of concentrating and magnifying the light on the road. This light is made glareless by the light from a carefully determined proportion of clear glass above the bull's-eye. The clear glass at the bottom provides the necessary front and side lighting.

The Dillon is the only lens made that gives you TWICE the lighted area, by projecting a SQUARE path of light. It is also the only lens made that projects entirely beyond the rim.

In no respect is the Dillon excelled and any of its chief features alone make it supreme in its field.

Write for literature, or send cash, check or money order, together with make and model of your car if you cannot obtain Dillon Lenses.

Steel for Service

Speed Up Production

is the order everywhere in manufacturing plants engaged in making munitions or turning out other sinews of war.

Work in all industrial lines in any way connected with our national welfare is being carried on at high pressure. The utmost is demanded of men and of machines.

Machines equipped with gears made from

Carnegie Rolled Steel Blanks

are not likely to be idle due to broken gears. Even if a concern has a gear in its stockroom for replacement, losses will be considerable; if it has to go outside the factory it is dependent upon the product of a rushed plant and uncertain transportation, and losses may run into thousands of dollars.

Gears made from Carnegie Rolled Steel Blanks wear three to seven times as long as cast steel gears, and if properly heat treated by the gear cutter, they never break.

The Tireless Lubricant

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE
NON-FLUID OIL

is always on the job; starts lubricating the instant your car moves—unlike grease which must first be softened by frictional heat.

Every particle of NON-FLUID OIL in bearing or gear lubricates until entirely consumed. Does not melt and leak out nor harden and permit gears to channel through it.

Use "K-00 special" grade for gears; "K-000" for bearings.

Your dealer has it in the orange can with trade mark as above.

Send for a copy of "Lubrication of the Motor Car."

Hyatt Quiet Bearings are appreciated by everyone who drives a closed-car.

This Illustration Shows WHY Hoover Steel Balls are recognized throughout the world as the finest in construction. The Hoover chrome steel, hard surface, tough center ball, provides for steel contraction and expansion and allows for fatigue in service. Breakage is eliminated. In five years, with millions of Hoover steel balls in service, there has not been a single report of breakage. That a majority of mechanical engineers recognize the scientific correctness of Hoover Steel Balls is proved by the fact that 95 per cent. of all motor cars are Hoover equipped.

Radiator and Lamp Repairing. Schools. Portable Garages

RADIATORS

By dealing directly with us you save from 30 to 50% on new radiators and receive a high-grade guaranteed Honeycomb radiator that has all the qualities required for efficient service. Our radiator has been adopted as standard equipment by automobile manufacturers who desire quality. Radiator Repairing.

Auto Radiator Mfg. Co.
764-66 W. Van Buren St., Chicago

RADIATORS and FENDERS

Also HOODS and TANKS Made and Repaired

DAVIS & SCHEGG CO., 7 & 9 Bigelow Ave.
2126 B'way, New York, N.Y. Woodhaven, L. I.

RADIATORS

Send that sick radiator to the radiator hospital. We will operate and give it renewed life by removing the bad part and putting in its place an INDESTRUCTIBLE honeycomb core. Not one case lost yet. Always a successful operation. Result: A Happy Car Owner saves the price of a new radiator.

DES MOINES AUTO RADIATOR WORKS
1325 Grand Ave. DES MOINES, IOWA

ANY RADIATOR—no matter what make or style, foreign or domestic, whether twisted, frozen, dented, bellied or sprung, can be repaired by us and made tight. We have a special process for reinforcing **Ford radiators. FOWLER**, the Radiator Man, successor to Frank A. Neveu, 2655-57 Main St., Dallas, Texas. Phone Bell Main 1400.

PEERLESS AUTO BODY POLISH

A varnish food to brighten and renew the appearance of all varnished surfaces on an automobile. Applied and polished ready for use in a very few minutes.

Sold by Garages and Auto Supply Stores

THE COLUMBUS VARNISH CO.
Columbus Ohio

Be Trained for Auto Expert

Come to the oldest, greatest and most successful, practical automobile and tractor training school. Now in its twelfth year. Thousands of graduates have been taught with the most comprehensive array of equipment ever assembled for instruction purposes. Real master instructors.

Here you can learn in a few short weeks to be a real expert to know how to operate, adjust and repair successfully and economically any automobile or tractor, also how to demonstrate and sell cars, tractors and accessories. You can be a real expert for less than you can afford to be a dub. Write for my catalog.

Speed up your trucks

Help our Nation by making every truck do its utmost. Know its mileage. Be certain that every truck you operate covers its maximum distance. Know its gasoline consumption. Be sure that drivers never let motors idle. Careful checking reduces operating costs—makes the truck *do more*. Mileage must be measured—not estimated.

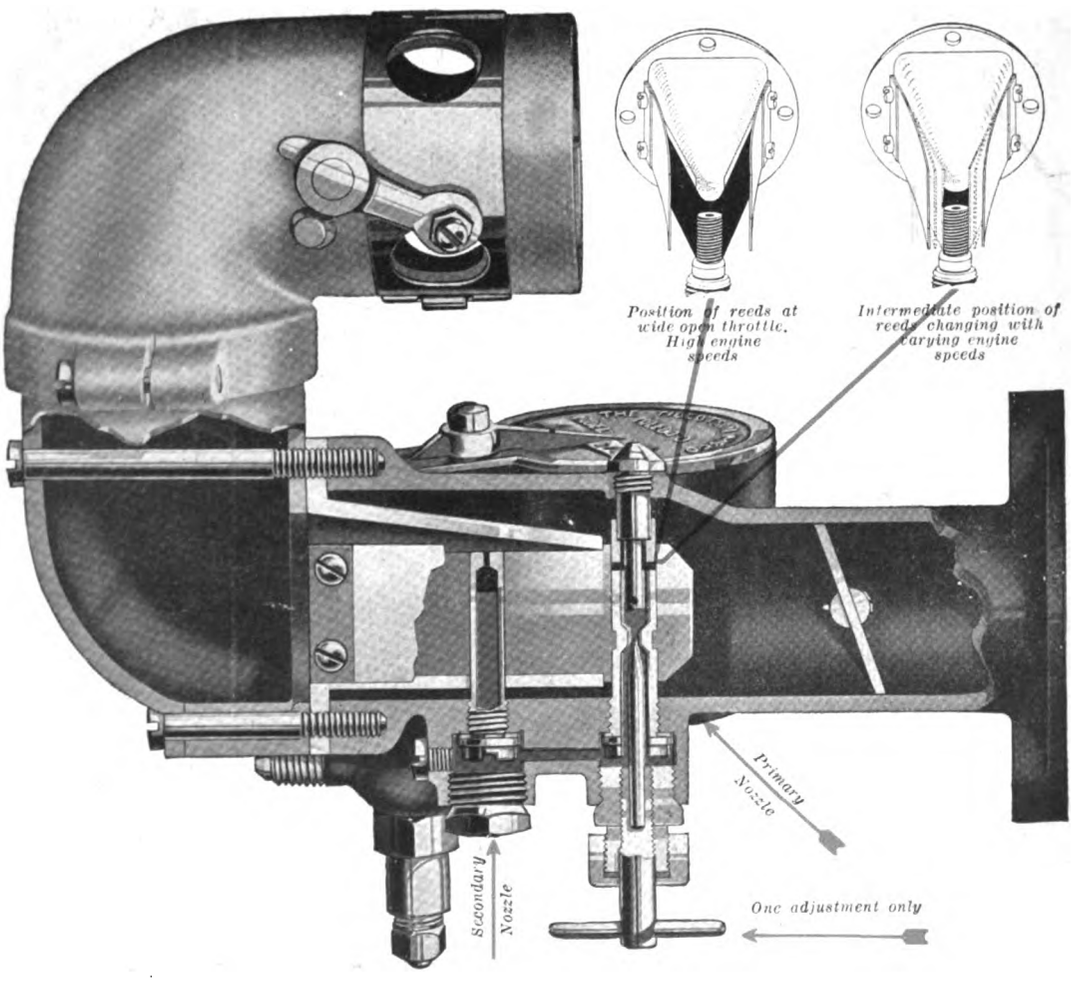
Tillotson
CARBURETOR

EXPERTS on carburetion — engineers and manufacturers of motor cars and motor trucks— who are thoroughly familiar with the Tillotson design, know that its advantages are centered about the automatic air valve with which it is equipped.



In all other respects the principle involved is the same as used in other makes of carburetors.

We make no extravagant claims, but we believe we can produce results with Tillotsons that you as an engineer or manufacturer cannot afford to overlook.

If interested write us. We are at your service.

JOHNSON'S RADIATOR CEMENT

Repairs Leaky Radiators Instantly

Stop Those Leaks

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks in just a few minutes without laying up the car. No mechanical experience is required—all you have to do is to remove the cap and pour the cement into the radiator.

JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

Quick—Efficient—Harmless

Johnson's Radiator Cement contains nothing which can clog or coat the cooling system. It will ordinarily seal leaks in from two to ten minutes. It requires no experience to use Johnson's Radiator Cement.—All you have to do is to remove the radiator cap and pour it in.

"NORMA"
BALL BEARINGS
(Patented)

Quality—a thing sought after by every car and truck builder—a thing intangible, almost indefinable, but the most desirable element in a car or truck. One thing, however, is sure—quality must be consistently uniform throughout every part, every accessory, and every part of every accessory. There can be no minor flaws in the perfect jewel of high quality.

"NORMA" High-Quality Bearings are the standard bearings in those high-quality magnetos and lighting generators which are found so consistently good as to be the standards on high-quality cars and trucks. "NORMA" Quality explains.

New Methods of Chassis Lubrication

Designs for Minimizing Attention and Increasing Life of Parts—Advantages and Disadvantages of Oil and Grease Lubrication—Oil-less Bushings—Direct Feed and Wick Feed Systems

By Cornelius T. Myers

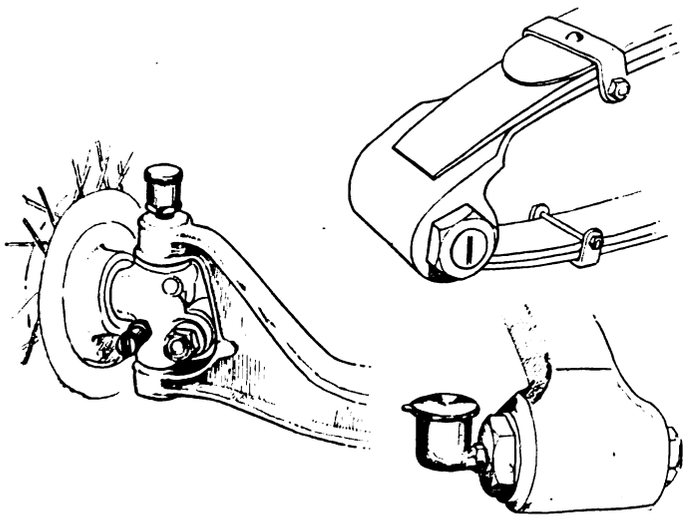
WHEN we speak of chassis lubrication we refer to the lubrication of such minor parts of an automobile as spring bolts, brake connections, universal joints, radius rod connections, steering rod joints, etc., which form connecting links between the more important units of the chassis. Lack of proper lubrication at these points is not immediately evident in the performance of a motor vehicle, whereas lack of lubrication in the engine, gearbox or axles makes itself felt in a very short time; hence, comparatively little attention has been paid to the lubrication of chassis parts and their durability and efficiency have suffered.

These parts also are in more or less inaccessible locations, as a rule, and the importance of their proper lubrication has been lost sight of. Rightly, the lubrication of these parts should have been more carefully considered, in the light of the important function performed by them, and especially on account of their comparative inaccessibility. Wear at these points is almost always due to improper or insufficient lubrication, and this wear is responsible for squeaks, rattles, emphasized vibration, and break-down to an extent only appreciated by an experienced garageman. The summation of small amounts of wear in many parts accounts for many chassis troubles, quite a few of which have been wrongly interpreted in the past. Major parts of the complete machine have been called upon to work under improper conditions and their design often has been adversely affected by these conditions.

Important Units Receive Attention

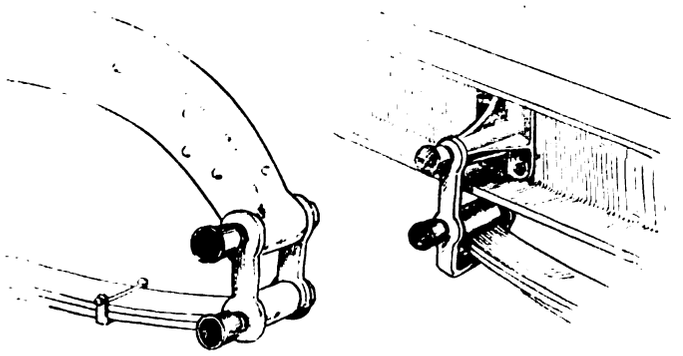
In gearboxes we have an instance of careful thought for lubrication in an inaccessible position. The details have been carefully worked out so that, under ordinary conditions, one filling with moderately heavy oil per year will suffice for satisfactory service. The same comment applies to rear axles, so far as the lubrication of parts in the housing is concerned. The general plan in these two instances is that of retention of lubricant and exclusion of dirt, to which method the design and operation of these parts lend themselves.

The lubrication of engines has been given careful and constant attention until very reliable systems have been developed. These systems are all based upon a continuous wastage of lubricant and the partial exclusion—partial removal—of foreign matter. It is upon this principle that the lubrication of most chassis parts must be handled, involving more or less continuous flow of lubricant. The more continuous this flow when the vehicle is being operated, the more efficiently will the bearing surfaces be lubricated, other things being equal. This being the case, care must be exercised to see that dirt or other non-lubricating matter is not picked up and led to the bearing surfaces.



Choice of Lubricant for Chassis Parts

The most important consideration in the design of the chassis lubrication devices is the choice of lubricant. Shall grease or oil be used? Each has advantages and drawbacks.



Grease is stiff enough, as a rule, to be more cleanly than oil and not flow over painted surfaces near the grease cups. It lends itself to compact and simple design of cups integral with spring bolts, and its firmness allows grease cups to be set at an angle or even in an inverted position, which is often very convenient where holes for the cups must be tapped in restricted locations. Some claim that grease will support heavier bearing loads, but the difference is probably more apparent than real. Grease can be forced by hand screws from the cups to the various surfaces. In hot weather the heavier greases are possibly more cleanly to handle than oil with the ordinary chassis fittings.

On the other hand, grease must stand under heavy in-

Oil cups with spring-retained caps on spring bolts of new Nash car

dictments. It is a splendid dirt carrier, and the methods of handling it expose it to dirt at every turn. We are all familiar with the open grease pail in garages, and with the dirty grease paddle which is scraped over the edge of the pail. We all know of dirty fingers lending their share to the contents of the refilled grease cup, which often catches no small portion of the dirt accumulated on the outside edges of the cup or its stud.

Another important consideration in the use of grease is that most greases are full of inert matter, which makes them more or less stiff and heavy, but which has a negative qualification as a lubricant. The heavy body of most greases is commonly thought to give them greater capacity for maintaining a lubricating film between the wearing surfaces, but this is not so, for in almost every case the stiffer the grease the poorer its lubricating value and its load-sustaining qualities, the inert filler acting as much in the nature of an abrasive as a lubricant.

Grease does not readily spread itself in a film over the wearing surfaces, especially if it is applied when they are loaded or when cold. This offsets the apparent advantage of being able to force grease out of the cups, for it often juts out at the opposite end of a bearing without actually spreading over that bearing, the appearance of the grease being a misleading sign that the bearing is properly lubricated. If all parts of a bearinng are not lubricated the dry parts will soon accumulate dirt or inert matter and start a cutting action.

When very cold it is almost impossible to force grease through small drilled holes and channels. It is therefore difficult to know when a grease-filled bearing is even getting the lubrication designed for it.

Grease on painted surfaces is hard to remove in washing a car.

Oil the Best Lubricant

Oil, as a lubricant, has great advantages over grease, but it is not always as cleanly and its proper application to chassis bearings has required more painstaking design than has usually been given to it. These things have militated against its use, especially on passenger cars, but the advantages that follow are appealing more and more to designers and to users.

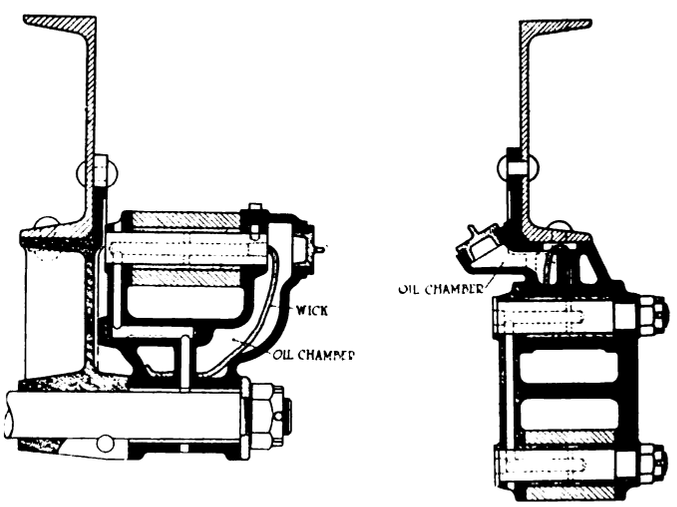
Oil will maintain as heavy a bearing load as grease, and with less friction.

Oil fed to one properly located point in a bearing will soon spread over the entire bearing surface.

Oil will flow through a very small hole, and it can be conducted a considerable distance by means of capillary attraction and surface tension.

Oil will carry much less dirt than grease, and it is not nearly so much exposed to dirt when in bulk or when being applied.

Oil contains no inert matter to clog holes and channels.



The oil used in the engine can be used in the chassis oilers, eliminating the necessity for carrying two kinds of lubricant.

Oil is more easily applied than grease.

A flow of clean oil tends to clear a bearing of any dirt which it may contain, and a bearing arranged for oil lubrication can be flushed and cleaned with gasoline or kerosene.

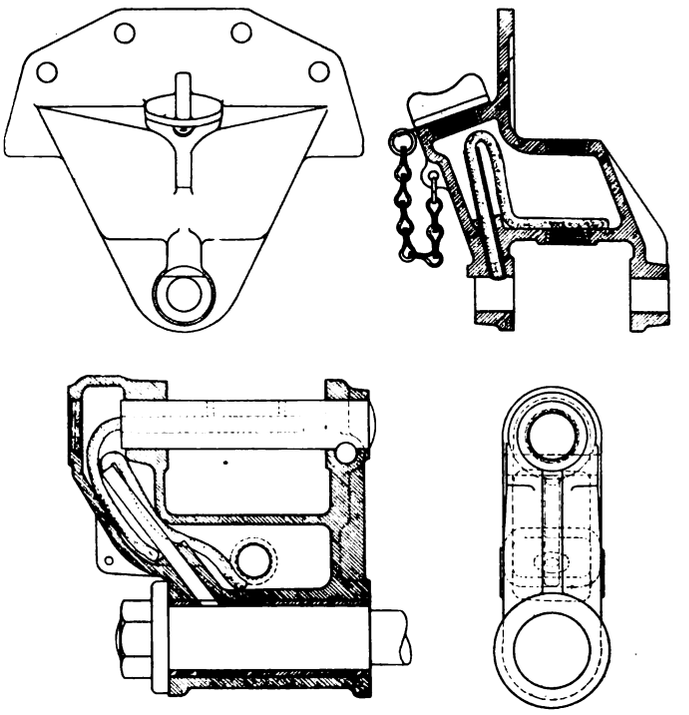
Oil for Chassis Lubrication

Up to a few years ago grease was almost universally used for chassis lubrication. In 1912 the writer had oil cups installed on some of the GMC trucks, and in 1913 designed and built an experimental truck on which oil was used at almost every point. This truck is still operating on the original pins and bushings, which show only a trace of wear. More recently we have seen a slow but steady increase in the use of oil, which seems now to have gained a very fair headway on both trucks and passenger cars. The severe service to which motor trucks have been put has proven the advantages of oil over grease, and it is in truck design that the greatest progress has been made in the use of oil. The court of last resort on the reliability, and hence the desirability of almost all features of chassis design, is the repair shop—our service stations and garages. It is here in particular that lubrication failures are noticed and the most reliable

Magazine wick feed shackle and shackle bracket as used on Fageol truck

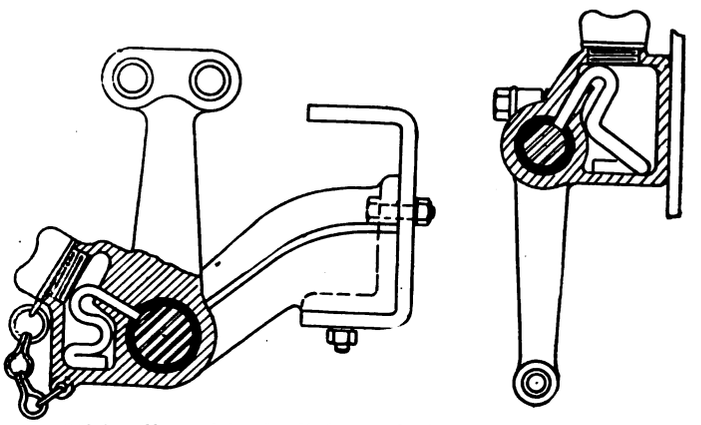
Digitized by Google

evidence secured. The most notable instance of passenger car chassis lubrication with oil was the outcome of extensive garage experience.



In the past 3 years so-called oil-less bushings of various composition have come into considerable use for spring bolts, pedal shafts, brake shafts, etc. Some are made of hardwood impregnated with lubricant, some of brass or bronze with inserts of graphite or other lubricant, some of a lubricant impregnated woven material, resembling brake lining, fitted inside a steel shell which holds it in shape. When properly selected and applied they have in most instances been quite serviceable, and showed a notable improvement at points which have heretofore not had much, if any, lubrication, because they have been difficult to reach.

The writer considers these bushings in the light of a palliative and not a solution of the problem of lubricating such points, because they contain a very limited amount of lubricant which must suffice for the life of the bushing. These oil-less bushings are well adapted to eyes in levers and rods which usually get no lubrication at all, such as the eyes in clutch throw-out levers, brake levers, etc. A better way of lubricating these points, however, is to arrange that the drip or seepage from other bearings is led to them.

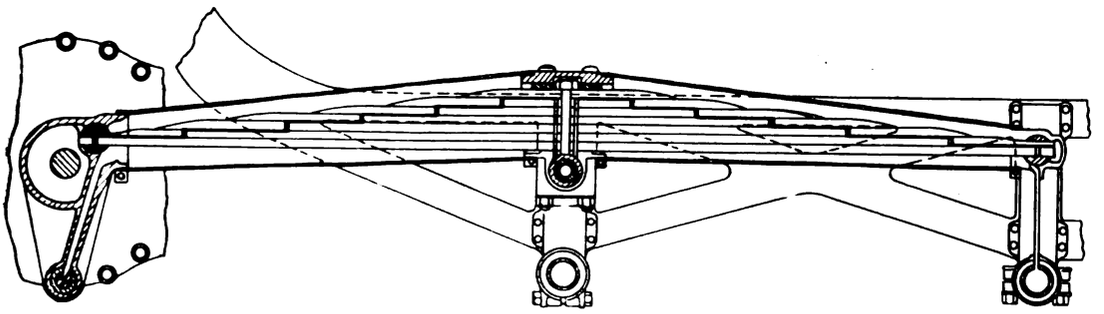


That oil lubrication of many chassis parts has been adopted by quite a number of well-known builders shows that experience is being heeded, and attempts to improve reliability are being made. As *reliability* is the large word in all automotive design we can expect further improvement in details for the use of oil.

This brings us to the consideration of the methods to be used in handling oil as a chassis lubricant. There are two general methods: 1—Direct feed. 2—Wick feed.

1—The direct feed method can be divided into two systems: *a*—The individual point; *b*—The central supply.

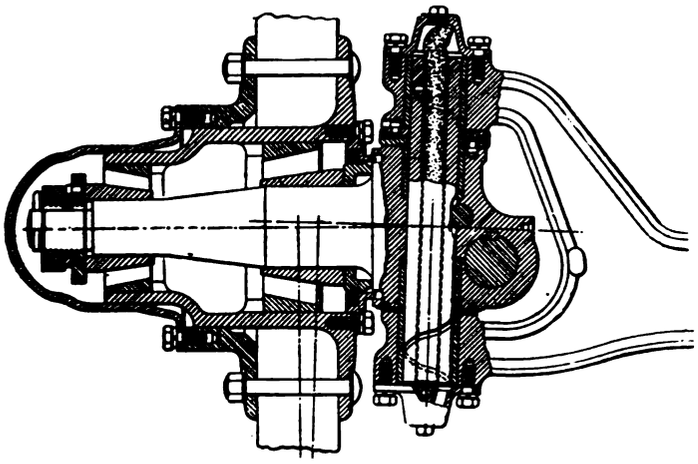
Above—Front spring front bracket of Class B war truck, showing chain-held filler plug and pipe for wick. Below—Rear spring rear shackle on Class B war truck, showing separate feeds for spring bolt and shackle bushing



Wick oiling of brake linkage shafts on Class B war truck

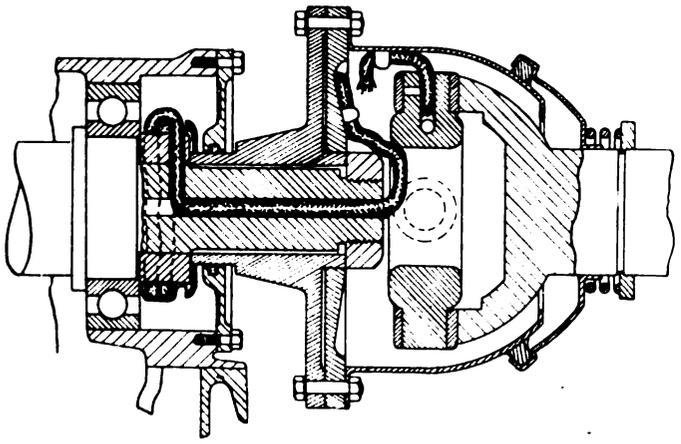
Individual Feed System

The individual point system consists of small oil cups applied in the place of grease cups, with the necessary modifications to insure gravity feed. This is crude and open to the objections that dirt can enter the bearing with the oil, that but a small amount of oil is carried at each point, and that the oil is quickly drawn from the cup. This means that frequent attention (almost daily) is necessary, oil is wasted, and it sometimes drips and makes the neighboring parts somewhat unsightly.



Various types of oil cups have been used to minimize the outflow of the oil they contain. Those most popular are small brass cups, ⅛ in. pipe tap size, with a snap lid, and which contain a thimbleful of wool or cotton waste held in by a wire screen. Any such cup, however, is objectionable because it can be, and often is, easily knocked off, leaving the shank jammed in the tapped hole. They are so small that the loss of one sometimes goes unnoticed for some time, and then replacement is delayed because the machine seems to run all right without it. In this system the brackets for pedal shafts, rocker shafts, etc., are simply drilled and countersunk to receive a drop or so of oil from a squirt can when the spirit moves the man in charge to be over-curious and discover them.

The only instance of the central supply system is that embodied in the Fergus car. In this chassis oil is led from the motor by pipes to four central supply points—the fulcrum pins of the cantilever springs—and from these



Fergus cantilever spring enclosed in a leather boot and provided with oil channels for a regular system of oil circulation

Digitized by Google

Wick lubrication of knuckle pin bearings on Class B war truck

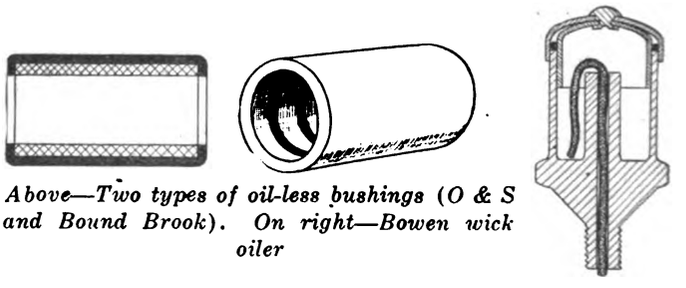
Myers' system of wick lubrication for universal joints

is distributed to springs, spring bolts, steering and brake connections and levers. Only a few of these cars have been placed on the market, and the system has not been adapted to any other car, so far as the writer is aware. This is possibly due to the fact that it does not lend itself readily to our more or less standardized chassis design. The oil, being supplied by a pressure from the engine, is liable to a considerable loss due to leak or breakage, with consequent danger of exhausting the supply in the engine and the nuisance of a considerable flood of oil. The system, however, courts development.

Feeding Oil by Capillary Attraction

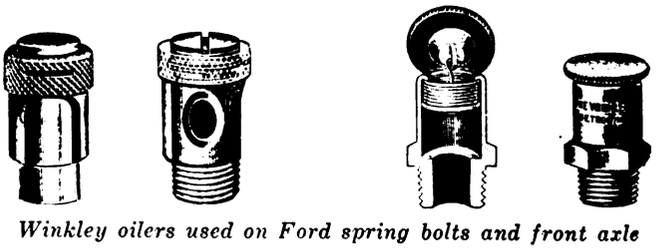
The wick feed method can also be divided into two systems at present, viz.—the individual point and the magazine feed, which latter is really a development of the former.

The individual point system was first used by the writer in 1913 (on the truck to which reference has been made) and consisted of small wick oilers applied in place of grease cups, certain of the chassis parts being designed to lend themselves to this kind of lubrication. The results obtained were so satisfactory that the writer became a firm advocate of oil for chassis lubrication. From 1914 to the present we have seen more and more use made of this system, which is quite effective. The wicks feed oil slowly but speedily when the machine is in motion, and the oil supply is conserved so as to last much longer than with the direct feed cups. The large number of points to be oiled, however, make it likely that some will be overlooked; and the small wick oilers are open to the same objections as the direct feed oilers—they get damaged or lost and are not often replaced promptly.



In 1915 the writer conceived the idea of improving the chassis lubrication by a magazine system using oil carried so as to require a minimum of attention, both as to the number of points and the number of fillings; which would feed clean oil as needed to the bearing surfaces; and which would not be liable to damage under careless handling. The first opportunity for carrying this out came in 1916, when it was incorporated in the design of the Fageol line of motor trucks.

Magazine System for Oiling Chassis Parts



The main feature of this magazine system was a series of hollow brackets and shackles for the spring bolts and rocker shafts. These brackets held oil which was wick fed to the various bearing surfaces by capillary attraction, there being no direct gravity feed. Felt wicks about ¼ in. in diameter, dipping to the bottom of the pockets, carried the oil to the top of the pockets and then through drilled passages to the bearing surfaces. In some cases after reaching the initial bearing the oil flowed to another nearby and then to the springs, which were kept from rusting and from stiffening. The rear spring shackles are hollow and contain oil fed by wicks to the spring bolts and to the shackle bar. The pins of the front shackle are fed in series from the bracket above. The knuckle pins and the steering connections on the front axle were designed to take large steel oil cups with wick feed. The cored brackets hold oil enough to last from 6 weeks to 2 months; the supply in the cups will last about half as long. The brackets are closed by large pipe plugs, the cups by swivel caps with registering holes near the wall of cups.

The scheme was further developed in the Class B war truck, where the brake levers and brackets, shackles and shackle brackets are cored and the oil is wick-fed to the bearing surfaces. The filling holes are closed with large wing plugs permanently attached by chains to prevent loss. The knuckle pins in the front axle are oil lubricated by wicks leading oil from wells at the bottom of the pins up through the pins themselves, and fed to the bushings and thrust washers.

The method of lubrication has many advantages. It requires almost no attention—once a week for the cups and once a month for the brackets at the most. There are but very few oil cups, they are not exposed to damage, and the cups are large (¼ in. or ⅜ in. pipe tap) and strong. They are well protected, as they are only used on steering connections, rear axle brake camshafts, steering gear, pedal shafts, etc., which points are not exposed to collision. Dirt cannot enter bearings with

the oil, even if the oil is dirty or if dirt enters the brackets and cups when being filled. Under the action of vibration and the movement of the lubricated surfaces the oil feeds slowly and regularly whenever the machine is in motion, but stops when the machine stops. This renders every bit of bearing surface continuously effective and prevents wear, squeaks, rattles and rust. The same oil used in the engine can be used in cups or brackets. This insures a good lubricant, and one which is light or heavy as the weather is cold or hot. So little oil is used that the expense is very small—less than grease when grease is applied as often and as carefully as it should be. The cups and pockets can be easily and quickly filled, and it is not a messy job; they can also be cleaned with gasoline and a squirt gun.

Control of the Feed

The main disadvantage is that at some points the oil is apt to feed more freely than necessary and coat the surrounding parts, unless care is taken to get wicks of the proper material and properly fit them in the holes. Rapid feed would be particularly objectionable from a passenger car standpoint, but care in design and fitting will obviate this. Cotton wicks and wicks loose in the drilled holes feed quite fast. Felt wicks, especially when snugly fitted, reduce the feed. If a very fast feed is desired a couple of fine wires, twisted and used as a wick, will give a surplus of oil at the expense of more frequent filling of the cup or pocket.

Where there is a great deal of vibration, as on axles, the rate of feed is accelerated. This is also the case where there is a great deal of motion between the lubricated surfaces, as is often the case with front spring bolts. The location of the final outlet hole to the bearing surfaces, too, has an influence on the feed, which is slower when this hole opens on the load side of the pin than when it opens on the free side.

A series feed from a wick oiler. Oil is supplied to the thrust bearing, the screw and nut, the trunnions and rocker shaft of the Ross steering gear, and the slight leakage is conveyed by a spiral channel on the steering arm to the ball joint. A branch feeds the pedal shaft bearings and the leakage goes down to the clutch release lever and oils its clevis

Feeding Oil by Wicks

Objection has been made to feeding oil by wicks in cold weather, on account of the increased viscosity of the oil. It is true that the flow will be reduced if some means is not taken to offset very severe weather; but the system lends itself remarkably well to this condition, as the oil can be thinned down with kerosene. If engine oil is used at the chassis points, lighter oils are commonly used in cold weather, anyway. The lubrication afforded by grease in very cold weather is almost negligible, because it is almost impossible to force the grease to the bearing surfaces.

In all trials of the magazine system that have come to the writer's notice, its reliability, efficiency and durability have been well proven. The upkeep cost is practically nil. Operating cost and attention are reduced to a minimum. The first cost of brackets is somewhat greater, but there is a saving on fittings, so that the net cost is a little more than the old grease cup system of lubrication. For trucks the increased cost is not important, compared with the advantages secured. This should also hold for passenger cars, but up to the present the writer knows of no applications in this field. The improvement and modification of the details of design will obviate objections to this system as a production proposition, for it tends toward simplicity and not complication, and it is susceptible of considerable development as to detail.

The magazine system is applicable to the front axle, spring bolts and shackles, steering gear, starting crank, fan, pedal details, etc., and it lends itself to what might be called series lubrication—the seepage or surplus oil from one bearing being led to another and thence to a

Digitized by Google

third or even fourth; as in a steering gear, oil can be successively used on the thrust collar, the actuating mechanism and the trunnion bearing, and then led out and down the steering arm to the ball joint on the drag link.

The lubrication of universal joints has always been an unsatisfactory proposition. Oil is the best lubricant, but great difficulty has been encountered in retaining oil in the casing of the joint for more than a short time. Hard grease is easily retained, but is a poor lubricant at these points, especially in cold weather. A medium grease is most used, but it is far inferior to oil for the same reasons as were given for other chassis parts. One of the illustrations herewith shows a method devised by the writer for magazine lubricating a universal joint by drawing small amounts of oil intermittently from the gearbox, clutch case or rear axle. If the oil ultimately escapes, as it will in the ordinary joint, it will be in very small amounts and will make little difference. It can be so arranged that a part of the escaping oil will lubricate the slip joint. This is very important, especially with machines that use the Hotchkiss drive, where there is a considerable movement at the slip joints. Unless this point is well lubricated, a serious end thrust will be put upon the universal joint and on the bearings behind it in the gearbox.

Advisability of Spring Lubrication

There is some difference of opinion as to the advisability of lubricating a spring. The magazine system leads the surplus oil from the spring bolts to the spring leaves. This prevents rust and eliminates squeak. It maintains the flexibility of the spring at approximately that given it by the spring maker, depending upon the amount of oil led to the spring, its distribution between the plates, and the manner in which the plates are formed and fitted. When the flow of oil to the spring bolts is properly regulated, there is not sufficient oil led to the leaves of the spring bolts to destroy its interleaf friction, for the high spots between the leaves break through the oil film and there is metal to metal contact—but without squeak and without accumulation of rust.

Labor Shortage Calls for Automaticity

To-day in every line we need devices that require the minimum of attention and serve their purpose with the greatest reliability. The passenger car and motor truck of the immediate future must offer these advantages, for they will be called upon to serve more constantly and there is surely going to be a shortage of chauffeurs and garage help. Women now drive their cars and should be able to care for them, when necessary, with but little assistance. Women will be called upon more and more to handle delivery cars and light trucks, relieving the shortage of men as they are called in greater and greater numbers to our armies. The men left in the garages will have less time to pay attention to detail, for they will have to look after more machines. The little troubles that so often cause annoyance and breakdown are largely due to lack of lubrication, and as a fighting nation we cannot afford them. By the provision of lubricating devices as described they can be avoided.

Strenuous Tests of the Class B War Truck

WHEN the first samples of the Class B truck were completed they were subjected to the severest kinds of tests to bring to light any possible weaknesses. Roads and trails resembling as closely as possible the shell-torn highways behind the front in France were selected. Some of the tests are illustrated herewith

Opposition to Standardized Trucks

Disagreement Among Manufacturers Interested—Effort to Sidetrack Standardized Models—Arguments Advanced by Both Sides

WASHINGTON, Feb. 27—It is not surprising that the national significance of standardization of war apparatus such as trucks, aviation engines and tractors should not be duly appreciated by the entire industries producing such apparatus when it is remembered that many of these great industries have since their inception been engrossed with necessary expansion to meet imperative demands from waiting buyers.

War has injected new imperative factors into standardization as a needed war weapon, and it will be some time before the national and international significance of war standardization and great post-war standardization is appreciated.

The economic fundamentals underlying such are not as fully appreciated as they will be 12 months hence.

Significance of Shipping Tonnage

The significance of shipping tonnage, and the simplifying of the maintenance of war apparatus on the other side in view of shortage of skilled labor, as well as shortage of man-power and shortage of foods, are major considerations that must be analyzed in the light of the world aim.

The arguments pro and con regarding the program of standard war trucks by the Quartermaster Department have filled Washington with rumors for several weeks and these arguments are broad and deep in their ramification of the industry, more so than is appreciated by many.

Much Accomplished by Exchange of Views

Fortunately, an industry such as the automobile and truck industry has been schooled in the get-together plan of making progress, and while those holding counter views are yet far from coinciding in action, the exchange of views has already accomplished much, and the continuance of such frank exchange of views should soon clarify the atmosphere in official Washington on this standardized truck problem.

It has been generally recognized for some months that the motor transport requirements of our army should be pooled to give the highest efficiency and to eliminate duplication of effort and other waste. A movement toward this co-ordination was started several weeks ago.

Reports were to the effect that all motor truck activities of the army, except aviation trucks, would be pooled under the control of the Quartermaster Motor Transport Division, which has fathered the standardized truck program and would obviously carry the standardization idea into the other corps of the army. Recently, other rumors became current.

There have been reports that other appointments to control the co-ordinated activities of the army would be made in which the standardized truck program would undoubtedly suffer.

Those deeply endeavoring to interpret the spirit of the war and post-war program of standardization see in the present line of standardized trucks advantages as follows:

Advantages of Standardized Trucks

1. They believe that those manufacturers and others allied with them are really injuring themselves by opposition to the standardized truck program, because this program is so logical and so necessary to the success of our motor transport service, and that opposition will only result in injury to truck makers opposed to standardization if they attempt to satisfy the truck requirements of our army in France with various individual makes. Many of these will find themselves during the war so congested with war work as to have to neglect the commercial field, and in this way allow competitors to gain in their control of this market.

2. That standardization of military motor trucks is essential, because it simplifies and will soon speed up production. It reduces duplication of effort in engineering designs as well as in securing trucks and maintaining them. It reduces very materially the number of different parts to be carried in stock in the foreign repair depots.

3. That production of the standardized trucks, which has already started on the Class B truck has been delayed only because of fuel shortage and will soon be in full swing.

4. That the standardized trucks have proven their practicability, sturdiness and economy by the test drives to which the sample trucks have been subjected since they were manufactured.

Reasons for Opposition

5. That some opposition to the standardized program is due to what might be termed an insufficiently complete analysis of the influence of standardized trucks during the war and after it on the manufacturers building them as well as those not building them.

6. That the standardized trucks have produced opposition because they can be made as cheaply and possibly more cheaply by $500 than the various makes of trucks on the market; this refers to the 5-ton standardized Class B truck, as compared with the average 5-ton truck.

7. That opposition to the standardized trucks is fur-

Digitized by Google

ther induced by the fact that repair parts costs will be 50 per cent lower on the standardized B truck as compared with some 5-ton trucks.

8. That truck assemblers will be able to make the standardized trucks for commercial use as cheaply or cheaper than they can produce their trucks, and that the assemblers can point to the low repair parts costs and to the fact that the Government has found the standardized trucks worthy and thus create powerful competition.

9. That despite having called in truck makers and others to aid in drawing up the forms of contract which provide for 10 per cent profit for the assembly or manufacture of the standardized trucks, the contract and the profit are not to the liking of some manufacturers who would like 15 per cent profit.

Would Create Competition

10. That because certain passenger-car companies have been given contracts for trucks they will continue to make these trucks after the war and thus provide additional truck competition.

11. That the truck makers and others opposed to a standardized truck program have a plan by which they hope gradually to reduce the importance of the standardized truck, and that that plan includes the appointment of some motor car manufacturer antagonistic to standardized trucks as civilian in charge of a pooled motor transport service and the appointment of another civilian with like policies in charge of the Quartermaster standardized trucks with a view of gradually allowing the standardized program to be curtailed and become an insignificant factor.

Concretely, those not entirely in sympathy with the standardized truck program see the reasons for their attitude as follows:

Reasons Against Standardization

1. That the standardized truck program cannot be fulfilled in the time anticipated and that we will not have the requisite number of trucks for our army unless we use the various makes of trucks available.

2. That the engineers who designed the standardized trucks were granted too much freedom and incorporated many expensive and useless designs.

3. That the standardized trucks of all types are many months behind their original schedules of delivery.

4. That the upright steering post and other features of the trucks will make them impractical.

5. That the Ambulance Corps, which was given considerable consideration in designing the Class AA trucks, they report, refuses to purchase them.

6. That the standardized trucks are more expensive than other makes and consume more fuel.

7. That it is unwise to pause in this emergency and design and manufacture standardized war trucks when we already have many manufacturers with designs, completed tools, machines and factories and organizations ready to produce the various makes of trucks now on the market in quantities to meet our immediate military needs.

It is impossible at this time to vouch for the arguments of those holding varying views on how standardization will in reality evolve and work out in practice not only during war, but after the war, as all parties concerned are not available.

All that is desired is the broadest and most profound analysis of the facts in the case.

The motor transport section of the Quartermaster Corps has denied the report that the Ambulance Corps has disapproved and will not purchase the Class AA trucks. It points to the records established by the sample standardized trucks for proof of fuel economy.

It denies the reports of many months' delay in the production program, admitting that there has been some delay with the Class B truck caused by fuel shortage, but claims this truck will be produced in small numbers this month and will be in large production in March.

—

Trader Carbureter For Heavy Fuels

R. V. TRADER & CO., McKeesport, Pa., have developed a carbureter which they claim will operate successfully not only on kerosene but also on fuel oil, the cheapest liquid fuel known. According to Messrs. Trader, the evaporation of kerosene or other heavy fuel depends upon three factors, namely, the surface over which the fuel is spread, the temperature and the rapidity of air circulation. In the following the effects of each of these three factors is gone into at some detail.

Speedy evaporation may be secured by spreading the fuel over a very large surface exposed to the air. This will be readily understood when it is reflected that a small amount of kerosene in an open test tube will lose very little by evaporation in a given time, whereas if the same quantity of fuel were spread over a large surface, say 10 ft. square, it would be evaporated almost instantly. The evaporation may also be accelerated by heating the fuel, or the mixture of fuel and air, or by preheating the air, but the temperature must necessarily be high.

Another way of speeding up the evaporation is to carry off the vaporized fuel as quickly as it formed. This statement may easily be verified experimentally by placing a pan with the fuel in a chamber where the air is motionless and another pan with fuel in a blast of air. The latter will be emptied of fuel much sooner, owing to the fact that the vaporized gases are carried away from the surface of the liquid fuel as rapidly as formed.

In the Trader kerosene carbureter an attempt has been made to meet these three conditions of rapid evaporation. The small quantity of fuel which is ejected from the nozzle at each stroke is spread evenly over the large surface of a rapidly revolving disk. It is there heated by warm air which passes over the surface of the disk in a direction transverse to the motion of the fuel, thus carrying the gases evolved away rapidly.

The main air supply for this carbureter is taken from a stove on the exhaust pipe. The air passes from this stove into the throat of a small air turbine, where it is directed against the turbine blades, revolving the assembly of turbine motor, disk and shaft. This warm air revolving in the turbine housing is in direct contact with the disk and evaporates the fuel spread thereon by the nozzle; it then passes around the circumference of the disk over the circular, exhaust-heated hot spot on the casing of the disk. The theory is that the combustible mixture passes this hot spot at such high speed that it will not be appreciably heated, but should any drops of liquid fuel pass around the edge of the disk, owing to their greater inertia they would be thrown against the hot spot, where they would immediately be turned into vapor. The mixture enters the throttle passageway through a throat directed so that the air from the auxiliary air valve at high speeds will surround the gas in its passage to the manifold.

The Trader kerosene carbureter should preferably be used with a cast-in manifold. A carbureter suitable for a four-cylinder, 3¾ by 5¼ in. engine at normal speed in truck service will have a disk speed of from 600 to 2800 r.p.m. and the disk area is 12.56 sq. in. The temperature of the air entering the main inlet is said to be about 200 deg. Fahr. at low speed and not much above 225 deg. at higher speed. Of course, the evaporation of the kerosene materially reduces this temperature.

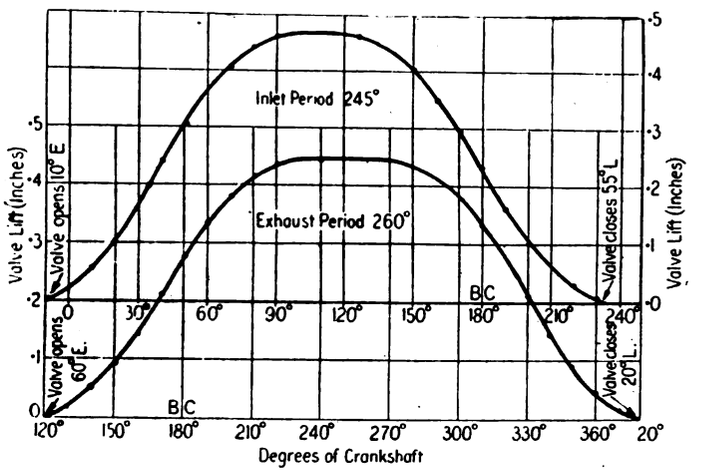
The Benz 230-Hp. Aircraft Engine

Forced Lubrication by Means of a Gear Pump—Gasoline Pump Delivers Fuel to Carbureter Under Pressure

(*Continued from February 14 issue*)

THE dimensions of the inlet and exhaust valves are the same, so that the weights are identical, each valve weighing 1.25 lb. The lift of the inlet valve is 0.465 in., and the lift of the exhaust valve 0.443 in., while the clearance of inlet tappet is 0.009 in., and the exhaust 0.015 in.



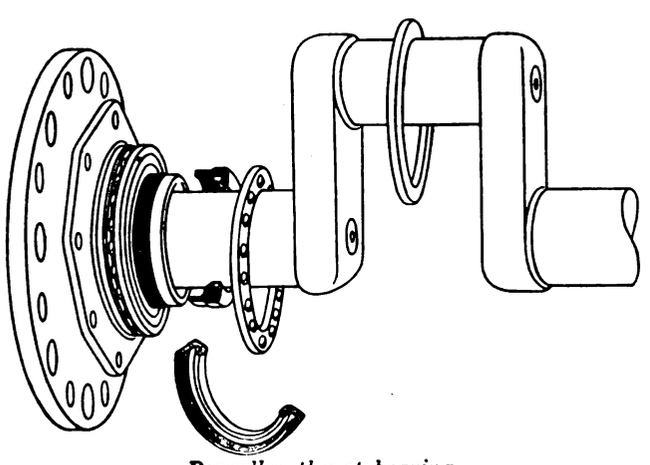
The hollow camshafts run in three plain phosphor bronze bearings of much the usual form. They are 53 mm. outside diameter, split on the camshaft axis and held together by wire rings on either side to allow the camshafts to be easily assembled in the crankcase. They are located by grub screws inserted from the outside of the casing.

The camshafts are driven by straight-tooth gears, in the usual manner, through an intermediate wheel that meshes with the crankshaft pinion. The gearing is arranged in the orthodox casing formed at the rear end of the crankcase, and the camshaft gears are bolted to the flanges on the camshafts, drilled to provide a vernier adjustment for setting the camshafts.

The half compression cams on the exhaust camshaft are engaged by lateral movement of the shaft, effected by a two-start square-thread screw of 24-mm. pitch, operated by a small lever at the rear end of the crankcase. The camshaft is returned to its normal running position by a spring inside the front end of the shaft. The half compression cams open the exhaust valves at 35° E. and close at 22° L.

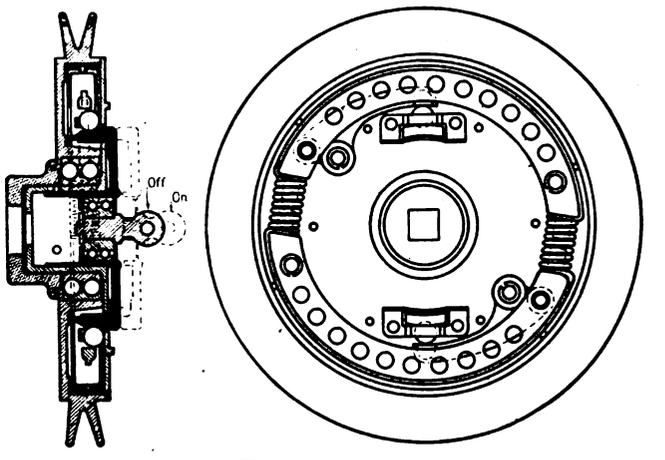
Crankcase

The crankcase is shown in the general arrangement drawing of the engine, and it will be noticed that the method of cooling the interior of the crankcase and sump indicates that this point has received careful consideration. In the top half of the crankcase six of the seven main bearing housings are so cast that the webs form air passages transversely across the engine, and two of these passages form the air intakes for the two carbureters—an arrangement similar to that adopted on the 160-hp. Benz engine.



Valve lift diagram

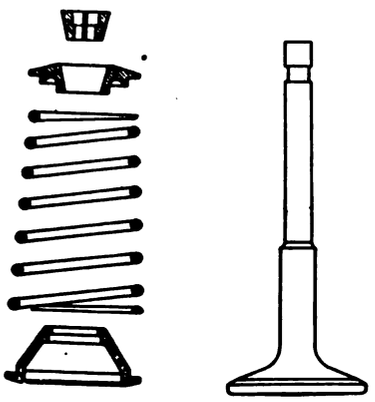
The bottom half of the crankcase is extended to form an oil sump, and is of rather unusual design. The lower portion is cooled by eighteen 30-mm. aluminium tubes arranged transversely across the chamber, the air being collected into the tubes by a large louvred cowl of sheet aluminium, attached to the induction side of the engine. A corresponding but reversed cowl is fitted on the exhaust side. Breathers are also fitted in the top half of the crankcase; the simple type of wire spring clip fitted to the breather lids will be noticed.



Carburetion System

Two separate carbureters are fitted, each feeding three cylinders. These are attached by flanges to the side of the top half of the crankcase.

By reference to the drawing of the carbureter it will be seen that the pilot jet is formed by an extension of the brass tube into which the main jet is screwed. This combined jet is screwed obliquely into the bottom of the float chamber casting, and not, as is usual, into the body of the



Propeller thrust bearing

Wireless drive

Digitized by Google

Valve and spring

carbureter. Attachment of the float chamber to the body of the carbureter is effected by two bolts.

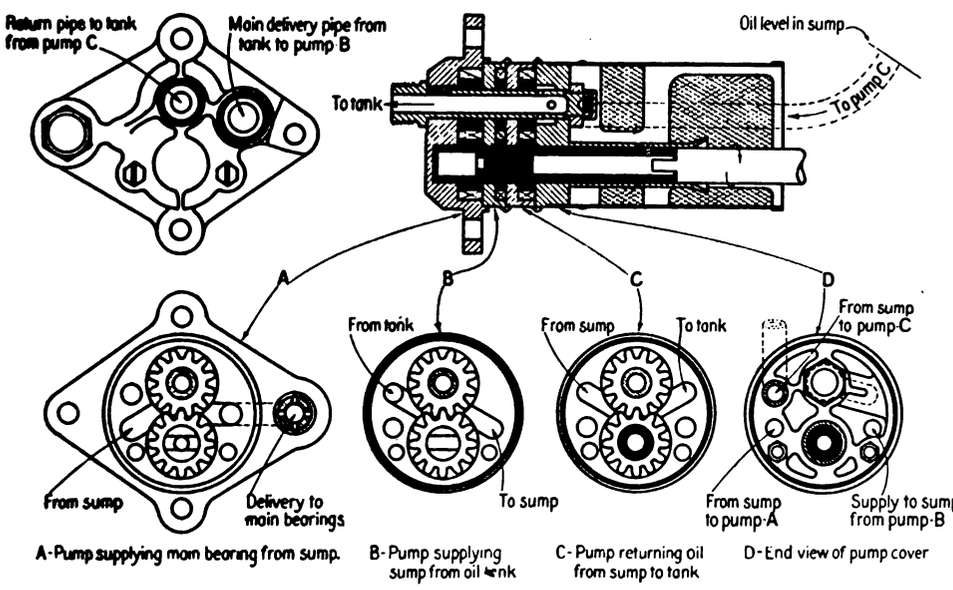
As already mentioned, the main air intake passages are cast in the crankcase between the webs of the main bearings, air entering each carbureter through two ports in the end of the throttle and also through the air passage at the base of the carbureter below the jets. At full throttle most of the air is taken through the air ports in the throttle above the jets, but when the throttle is closed for slow running the main jet is completely cut off and all the air is taken through the passage containing the pilot jet. When tested, the slow running of the engine proved to be very good.

The design of the air intake ports in the end of the throttle is shown in one of the drawings, which illustrates the throttle in half and full positions. The ports are so designed that the gasoline-air ratio remains practically constant over a wide range of throttle opening up to nearly half throttle; the last movement of the throttle, however, causes no increase in fuel flow, but, on the contrary, a slight decrease. The body of the carbureter around the throttle is water-jacketed, and is connected by an arrangement of steel piping to the delivery of the water pump, and also to the lower water connections at the bottom of the water-jackets between each pair of cylinders. The arrangement is clearly shown in the side view of the engine. No compensating arrangement is fitted for high altitude control.

The design of the branched induction pipes is interesting; they are built up of aluminium tubes with cast aluminium-flanged bends, and weigh only 2.625 lb. each complete with connections. The internal diameter of the induction pipe is 58 mm., and the connections between the flanged bends of the induction pipes and the cylinders, and also between the bottom ends of the induction pipes and the carbureters, are made with rubber ring joints secured by wide band clips. These joints when loosened, being more or less flexible, allow any one of the cylinders to be removed without disturbing the other joints of the induction branched pipes. The Royal Aircraft Factory test report computes the petrol consumption at 150 pints per hour, or 0.65 pint per brake-horsepower hour.

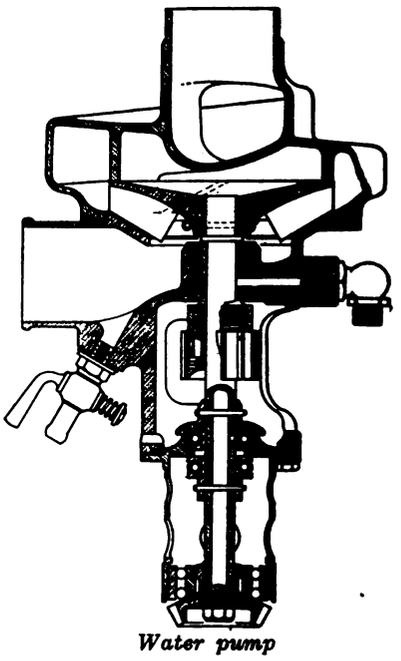
Lubrication

Forced lubrication of the crankshaft and connecting-rod bearings is effected by a small high-speed gear pump working submerged in the reservoir formed in the bottom of the sump. The pump is virtually a triple one with three functions, and its details are fully illustrated herewith. It works diagonally in the sump, and is driven through a long shaft by a gear that meshes with the distribution pinion on the rear end of the crankshaft.



Referring to the diagrams of the oil pump, the operation of it is as follows: Oil is drawn by the main pressure pump *A* from the reservoir in the sump through the holes in the end cover of the pump, lubricating the main bearings through the main oil pipe and the small branch pipes and hollow crankshaft. Thence delivery proceeds to the piston-pin bearings through the small pipes inside the tubular connecting-rods, and the surplus oil thrown out from the hollow cranks on to the camshafts, etc., returns by gravity to the sump, flowing over the air-cooling pipes in the base. Fresh oil is fed into the sump by the small suction pump *B* from the oil tank, while the correct working oil level is maintained in the reservoir by the gear pump *C*, the oil being drawn off through the bent pipe *E* and returned to the oil tank. The fresh oil from the oil tank passes through a cylindrical gauze filter attached to the under side of the crank case.

Oil Pump



The complete oil pump with its filter is easily detachable from the sump, being held in position by studs through the flange. A small spring-loaded ball valve provides the oil pressure release in the main oil supply pipe. The gears of the oil pumps and also the pump body are of cast iron. The weight of the complete pump is 2.89 lb.

Oil consumption during a Royal Aircraft Factory test was 4.5 pints per hour, equalling 0.02 pins per b.hp.-hour. The working oil pressures are 50 lb. maximum, 28 lb. normal.

Two Z.H.6 magnetos are mounted on brackets at the rear end of the crank case, and are driven off the cam-

The triple oil pump

Water pump

Digitized by Google

shaft gear wheels. The scheme of the drive is neatly carried through, and is clearly shown in the rear end view of the engine. Ignition control is effected by small-toothed quadrants that mesh with teeth cut in the under side of the magneto cam box. The interconnected levers of the timing control quadrants are coupled by a rod which passes through the end of the crank-case casting.

Two spark plugs are fitted to each cylinder, one on each side, and the high-tension wires are carried in a sheet aluminum casing attached to the cylinders. The ignition is timed as 30 deg. early fully advanced, *i.e.*, 18 mm. on the stroke.

Water Cooling

The centrifugal water pump is arranged on the top of the rear end of the crank case, the vertical spindle of the rotor being driven by bevel gears off the camshaft intermediate pinion, as shown in the large general arrangement drawing of the engine. The speed of the water pump spindle is 1.58 to 1 of the crankshaft, and the diameter of the rotor is 120 mm. The diameter of the water inlet to the pump is 50 mm., while the diameter of the outlet is 55 mm. Water enters at the top of the rear cylinder through the steel tube elbow, and, as previously mentioned, is deflected around to the exhaust passage of each cylinder. A double thrust ball race is fitted to the spindle, which is provided with a large stuffing gland; the spindle is lubricated by a grease lubricator operated from the pilot's seat.

From a separate test of the pump carried out at the Royal Aircraft Factory, in which the pump was removed from the engine and coupled to an electric motor, the following results were obtained, running at an average speed of 2100 r.p.m., equivalent to 1325 r.p.m. of the crankshaft:

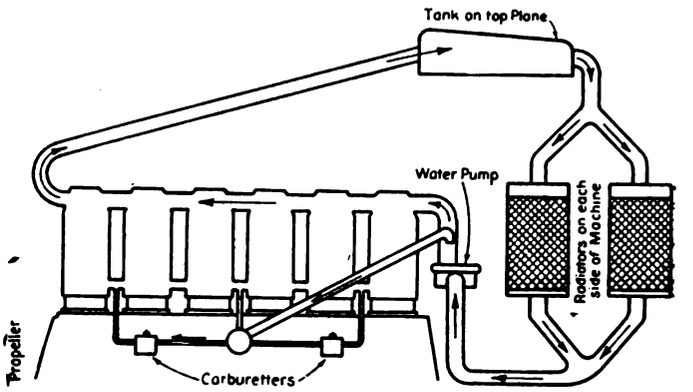
Maximum delivery = 120 gal. per min. with free outlet.
Minimum delivery = 48 gal. per min. against a pressure of 7 lb. per sq. in.

A diagram of the complete water-cooling system is shown, and from this it will be seen that the greater part of the water is forced by the pump directly through the cylinder heads in series, while the bottom portion of the cylinder water jackets is supplied through a branch pipe arranged just above the outlet of the water pump. This branch pipe is also connected to the carbureter water jackets, as shown in the diagram.

Water Connections

The water connections between the heads of the cylinders are made by rubber rings contracted by steel band clips of ingenious design. The strap of the clip is a thin strip of annealed spring steel, and this passes twice round the rubber ring, after which it is pulled up and fastened by a bolt in the link. In making the joint, the end of the steel band is first bent over the bottom bolt of the link and then twice round the rubber ring, the free end of the steel band passing through the center portion of the link on the second winding, when the end of the steel band is then fastened to the top bolt by inserting it into a slot suitably cut. Evidently when this bolt is rotated, the steel band is pulled tightly round the rubber ring and remains thus. The water capacity of each cylinder jacket is 1873 c.c., and the total amount of water carried in the engine, apart from the radiators, is 30.9 lb. Two rectangular honeycomb radiators are fitted, one on each side of the machine.

The automatic fuel pump constitutes one of the most interesting features of the engine, its function, of course, being to supply gasoline under pressure to the carbureter without the disadvantages of gasoline tanks under pressure. The pump is used in conjunction with a supplementary pressure reservoir inside the main fuel tank, and the system includes an auxiliary fuel tank and semi-rotary hand pump. Details of the main pump are shown in the general arrangement drawing, and its function and operation, together with the supplementary pressure reservoir, are explained by the diagram.



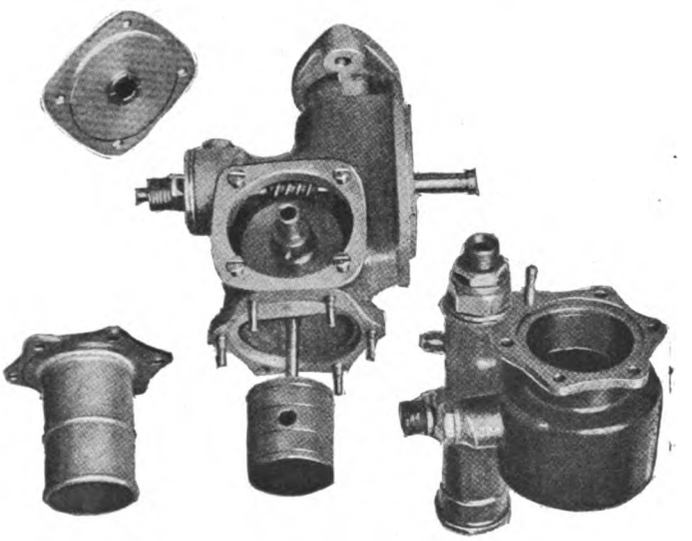


Diagram of cooling system

In its essentials the pump consists of a small piston of cast iron, 40 mm. in diameter, working in a cylinder of phosphor bronze, open at both ends. The piston is arranged below the crank, and the lower portion of the cylinder extends nearly to the bottom of a chamber, which contains castor oil. The piston is actuated by a connecting-rod, driven through worm gears by a spindle forming an extension of the inlet camshaft.

With regard to the operation of the pump, gasoline from the main tank enters the pump through the filter at the side, and on the upward stroke of the piston producing falling of the castor oil, gasoline is drawn into the annular chamber through the inlet or lower check valve. Upon the downward stroke of the piston, the gasoline charge, above the castor oil column, closes the inlet check valve and forces the charge out of the upper valve. The volume of gasoline discharged at every stroke corresponds, of course, to the displacement of oil by the stroke of the piston.

From the delivery of the pump gasoline is forced into the top of the pressure reservoir inside the main gasoline tank, and, rising in the reservoir, creates a cushion of compressed air above the gasoline, thus serving to damp out the pulsations arising from the action of the pump. From the bottom of the pressure reservoir the gasoline is forced upward through the shorter of the two pipes inside the reservoir, and is delivered at even

Details of fuel pump

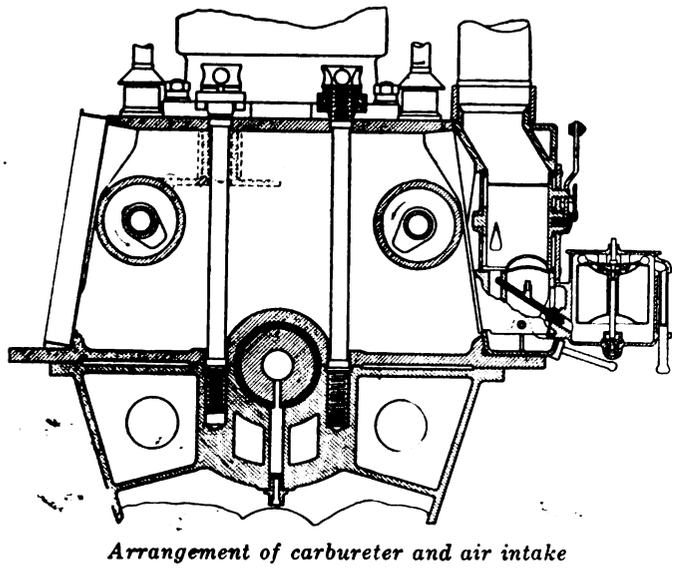
Diagram of fuel supply system

Fuel pressure reservoir

General arrangement of fuel pump



pressure to the carbureters. A pressure relief valve is fitted to allow excess gasoline to return to the main tank, which is effected through twelve holes drilled in the head casting of the pressure reservoir.

As illustrated in the diagram of the fuel system, a supplementary supply system is embodied, employing an auxiliary fuel tank and a semi-rotary hand pump in conjunction with the main system. Two three-way cocks are fitted, which allow any one of the following three means of supply to be utilized:

(*a*) Main gasoline pump from main tank.
(*b*) Hand pump from main tank.
(*c*) Hand pump from auxiliary tank.

The driving spindle of the gasoline pump also drives through bevels a vertical spindle operating the interrupter gear for the machine guns, while to the rear end of the pump spindle is fitted the flexible tachometer drive.

In the earlier types of gasoline pumps fitted to the Benz engines the castor oil chamber was provided with an oil-filling cap, which was screwed into the side of the chamber casting, and was fitted with a special form of drain cock to determine the quantity of oil poured into the pump. This filling arrangement has now been given up, and the annular oil chamber is fitted with a drain plug only.

Arrangement of carbureter and air intake

The following data in connection with the pump will doubtless be of interest, and attention is drawn to the tabulated test results of the Royal Aircraft Factory given below:

Speed ratio of the driving spindle to the small crankshaft driving the piston of the fuel pump.	10.75 to 1
Bore of the pump	40 mm.
Stroke of the pump	26 mm.
Lift of valves (inlet and exhaust)	2 mm.
Volume of gasoline delivered at each stroke of the pump	2 cu. in. (approx.)
Weight of complete fuel pump	6.75 lb.

The normal consumption of the engine is approximately 150 pints per hour at normal speed, and the pump has a greater delivery than this at any angle up to 60 deg. in any direction.

The maximum delivery of the pump in a vertical position is 288 pints per hour at 10 lb. per sq. in., running at 850 r.p.m. At normal speed, *i.e.*, 700 r.p.m., the delivery is 233 pints per hour; while at speeds in excess of 750 r.p.m. the inertia of the fluid columns causes displacement of the castor oil.

The pump was run for ten minutes with the piston in direct contact with the gasoline, with no deleterious effect, but a test of such short duration is, of course, practically valueless as being any indication of the possibility of permanently so running the pump.

A number of tests were carried out to determine the rate of flow, also the inlet and outlet pressures of the pump, while tilted at the angles likely to occur on a machine in flight. The effects of banking to the right and left, diving and climbing were thus shown, and the results are given in the diagram.

(*To be continued*)

IT is reported that German airplane constructors, instead of using mahogany and walnut for propellers, are using softer woods of different kinds laminated together. Experiments made to determine the strength of these propellers show that with the wood skilfully compacted together these propellers are as difficult to break as the best hardwood propellers. It must be remembered that the extreme strain necessarily makes the life of even the best propeller comparatively short, and there is something to be said for the view that efficient and durable propellers may be made from comparatively cheap timber.

Automotive Design and Transportation as Developed by the War*

Purchasers No Longer Choose a Car by Size and Weight —Economy of First Cost and of Upkeep the Deciding Factor—Tendencies in Design Revealed by New Models

By J. Edward Schipper

WE are to-day face to face with a condition in automotive engineering that would have been 3 years or more removed if it had not been for the war. War demands a general speeding up, and the methods of peace times no longer suffice.

One of the great problems which confront the world to-day is that of transportation. Under the demand for the movement of unprecedented quantities of materials and manufactured articles, as well as that of greatly increased passenger traffic of a military and commercial nature, the nation's railroads have been strained to the breaking point.

When it is considered that owing to heavy government purchases, more money is being spent for manufactured goods in this country this year than was spent in a period of many years previously, and that as a result every productive industry in the country has been pushed to the limit, it is not hard to understand that the weak links in the chain of our transportation system should give way.

Both within and without the country we must keep things moving. We must move fuel, materials, manufactured articles, food, clothing and armies. Transportation is the big demand of the age and with the railroads of the country taxed to their limit, it is automotive transportation that must be resorted to.

New Measure of Distances

A century ago ideas of distance were gaged by the abilities of the horse. If we thought in terms of the horse to-day we might just as well surrender, yet there are over one hundred millions of acres of land cultivated annually in this country to support the horse. Nevertheless, the days of thinking in terms of the horse in transportation are gone. Quick transportation, certain transportation and above all efficient transportation is the greatest demand of the age. Let us see how the automotive industry fits in with this demand.

The change from a year ago to now has been a change of peace to war. We have been awakened from our gilded dream to find out that our Chinese wall of internal self-sufficiency has crumbled. It has crumbled largely because transportation has advanced to such an extent that countries which, in the days of "no entangling alliances," were remote, have become our next door neighbors. This great change has been accompanied by a revulsion of feeling in this country, which would have been considered impossible.

A great wave of economy has swept over the country. Our great national fault has been extravagance. We have been extravagant of every resource. The great forests which once covered the country have been cut away so that to-day lumber is cheaper in the oldest countries of the world than it is here. Our minerals, the game of the fields and forests, all the gifts that nature bestowed on this country have been used in a lavish way and naturally along with this the habits of our people have been affected until we have become known as the most wasteful nation in the world.

This characteristic has been reflected quite clearly in our automobiles. The American people have been buying cars by size. They have been buying cars by the pound. If two cars were offered side by side, at the same price, but one larger and more gaudy in appearance than the other, there would have been no possibility of one competing with the other, as the larger one would have nearly all the sale in spite of the fact that the other might be a better piece of engineering. But a change has come.

We have suddenly awakened to the fact that the automobile of to-day is not efficient and not economical and at the same time the people of the country have been awakened by the exigencies of war to the fact that our daily habits, whether they are concerned with transportation or what not, must be more efficient and economical.

The result is that to-day people, when they are purchasing goods, want the most for their money. When they buy transportation they want the most transportation for the money they spend in the purchase and afterward in maintenance and for supplies.

Too Much Dead Weight

When we say the automobiles of to-day are inefficient, and are not giving the owner the value in transportation that they ought for the money expended, we simply mean that what he gets back in transportation is not enough in proportion to what he puts in.

Take for instance the man who owns a car weighing 2½ tons who drives downtown to his office, a distance of 5 miles. In the evening he returns, another 5 miles. If a friend were to offer to take him to his office and back for a dollar a day, he would probably laugh at him. Yet in all probability this is what it is costing him. The upkeep of such a car, even without including the depreciation which we all know is high in a car of this weight, will easily amount to 10 cents a mile.

The car weighs too much for the passenger load. The man weighs probably 150 lb. The car weighs 5000 lb.; in other words, 33 lb. for every pound of passenger weight. This is too much. The car is heavier than the average, it is true, but this example is taken merely to illustrate the point. Even with five passengers in the car, the weight would be over 6 lb. per passenger and this is too much.

Ton-Miles and Comfort the Objects

Study this from the transportation efficiency standpoint. We have two sides to the ledger sheet, on one side what we put in and on the other what we take out. We put in money in terms of fuel, time, weight of vehicle, labor (if a driver is employed), road or track maintenance and vehicle maintenance. We take out just two things: passenger-miles and comfort. The comfort comes extra in an automobile as it does on a Pullman car. In a commercial vehicle it is ton-miles alone.

We have got to get the best results possible and at the same time to keep the cost down to the limit. Most of the cost factors are in the control of the engineer, and, indeed, most of them are simply weight factors. Taking them one by one:

*Paper read before Detroit Section Society of Automotive Engineers, Feb. 21.

Digitized by Google

Fuel Consumption—Primarily affected by weight and to a moderate extent by design in average practice.

Time—Controlled by law and traffic conditions.

Weight of Vehicle—The real crucial factor involving displacement and weight of powerplant, length of wheelbase, physical qualities of materials, vehicle characteristics and purposes.

Road or Track Maintenance—Covered by state tax and a function of weight and horsepower in many states.

Vehicle Maintenance—Function of weight, materials, design, handling, road conditions and a number of other variables.

In every one of these items we have been high in the past and we must make a rapid change to reduce them if we wish to fit in with the desires of the public. If the progress of the times is to be studied, it must be done with the broad fundamentals outlined carefully in mind.

No War-Time Cars Yet

The new cars at the shows are hardly war-time cars. They have been out on the road under test for so long that they antedate the economy wave which has swept over the country. All that they serve to show is that the tendency was in the direction of what has now come to be a demand. This demand in a great many ways is not even known to the people themselves, yet it is there. The attitude of the people at the shows was to a large extent noticeable. They were searching for something they did not find and so they took the nearest thing to it, or, took nothing at all.

These people were looking for a car in which the weight per passenger was at the lowest limit. In other words a car that utilized every inch of wheelbase to the greatest possible efficiency; that was not of a displacement higher than necessary to carry the load; that had materials which returned the greatest amount of service because of their light weight and scientific disposition.

No longer were they looking for the biggest car that they could buy for a certain sum of money. The American public have had a psychological shock from which they have not recovered. It is to be hoped that they will not recover because the new condition is a healthy one begetting a higher plane of mental and physical existence. It devolves upon the automotive industry to design tools which suit this new state of mind. We must have efficient transportation.

At this time of the year when all the new cars have made their appearance and the designs for the following season have all been disclosed we are naturally interested in seeing the trends of development. This year, for the reasons pointed out, the trends can not possibly teach us as much as in the past because the designs in which they are included can not possibly have taken into consideration the change of the national psychology. Nevertheless, since we were beginning to move in the right direction it is important to study these developments to see what should be accelerated in order to meet the new conditions and new standards. We must hold up the past tendencies to the spotlight and see what conforms to our new demands for conservation and economy.

Only Five New Chassis at Show

At the shows there were but five really new chassis, incorporating new powerplants and redesigned to a sufficient extent to really classify them as being absolutely new. During the year two additional chassis which can really be classified as new were brought out. This gives a total of seven entirely new chassis which were not on the market a year ago. All of these have new powerplants and are the latest types under normal development. It is interesting to note that of the seven, five are four-cylinder and five have over-head valves.

Nothing radical is to be noted in any of these cars except that the leaning toward overhead valves is becoming stronger year by year. The conclusion cannot be avoided that an unqualified indorsement has been placed upon the overhead valve engine by the industry. The fundamental reason behind this development is naturally the effort to secure the greatest possible output from a given displacement. To secure high volumetric efficiency combined with a minimum loss through wall cooling a construction must be used permitting of the most direct entrance into the combustion chamber and of the most advantageous combustion chamber shape.

If we were to take all the American passenger cars on the market and strike a general average, the cylinder size would be 3½ by 5 in., and the average displacement, taking account of cylinder numbers, would be 269 cu. in. To look at this from the standpoint of engines of different numbers of cylinders, the following averages obtain:

No. of cyl.	Bore	Stroke	Piston Displacement
4	3.6	4.95	221
6	3.46	5.00	282
8	3.13	4.59	282
12	2.87	4.96	386

Contrary to what has been outlined as the probable future development of passenger car engines, the average engine is larger to-day than it was a year ago. The piston displacement is now 269 cu. in., as compared with 222 formerly. The gear ratio has been altered from 4.15 to 4.22, yet the increase in average tire size from 31 to 34 in. has prevented a large increase in the displacement per mile on high gear. A year ago this averaged 384 cu. ft. It is now 388 cu. ft. Thus, although actual engine displacement has increased, car ability as measured by displacement per unit of distance has not increased.

Overhead Valve Gaining

A census taken before the shows indicated an increase in overhead valve construction of 2.2 per cent with a corresponding reduction in L-head engines. The additions to the the list as brought out by new cars at New York and Chicago bring the increase in overhead valve engines to about 3 per cent. The percentage is rather lower than it ought to be, because the assembled cars practically all use L-head engines, due to the fact that the largest builders of stock powerplants confine their efforts to the L-head type. As each selection of an engine represents what might be called an engineering ballot in favor of that type, it is fair enough to take the chassis and obtain the average as given.

Probably one of the results of more carefully shaped combustion chambers, combined with a continued tendency toward larger valves, more scientific cam contours, better designed intake ports and galleries, and superior carburetion due to the development of the hotspot manifold and carbureter mixing chambers giving better velocities is that mean effective pressures have been increased.

More Radical Changes Next Year

If automobile factories get the opportunity to carry out designs which are being suggested by the changed attitude of automobile buyers, the changes made during this season will be more radical than anything in the last decade. There has been no incentive for the engineering department to make every inch of wheelbase return an inch of body space, riding comfort, or other concrete quality. The reason for this is that we have had more than enough wheelbase. At the present cost of materials and with the present objection of the public to carrying around any more useless car weight than is absolutely necessary, manufacturers are not going to be as wasteful of car length.

What can be done in this respect is hardly appreciated. For example, one concern which brought out an entirely new car this year shortened the wheelbase 7 in. and after rearranging the layout had as much room in the tonneau as in the previous model and 2 in. more in the front compartment. This result was not arrived at in an attempt to cut wheelbase length to the limit, but was more or less incidental to a design intended to be more economical than and equally good in performance as the previous model. With more passenger space and a smaller engine, a gain of 50 per cent in economy of fuel, and a large cut in weight, and a better performing car was secured. The improvement in performance covered acceleration, low speed torque, and speed range on high gear.

Engineering Talent Engaged on Other Problems

In an analysis of this kind, it is only fair to remember that it has been impossible to realize many of the anticipations of a year ago, owing to the fact that the minds of engineers who

Digitized by Google

would ordinarily be on development work have been employed on the vast task of designing and making ready for the production of government necessities. Another matter which has retarded development has been the scarcity of materials which normally would have come into their own this year. Without doubt aluminum would have been employed to a greater extent than ever before, but the fact that it remains scarce and expensive has prevented its use on any but high-priced products.

To come to some of the details in which alterations have been made during the year, the detachable cylinder head is one of the most significant. All the new engines brought out during the year have this feature, and, in addition, makers who have not employed the feature before have adopted it. Two Detroit makers, one manufacturing a high grade twelve, and the other a high grade eight, have changed over to the detachable head, showing that its practicability is recognized on the V engine as well as on the vertical. The early difficulties have been solved and they have been found to be due to two main causes, either insufficient metal around the studs, or insufficient water space permitting circulation around the head. Care has to be taken that the tension on the cylinder head retaining studs does not distort the valve seat.

Cold Weather Starting Devices

For 3 years the fuel question has been exerting a highly important influence on engine design. This year there has been a crop of the so-called hotspot manifolds. There is no doubt that the use of these has resulted in a material reduction in the warming-up period. This is of considerable importance, as with the highly efficient choking devices employed on up-to-date carbureters, a stream of raw gasoline is drawn into the cylinder during the cranking period and naturally some of this is sure to leak past the piston rings, with the result that considerable crankcase dilution occurs, destroying the lubricating qualities of the oil.

Cold weather starting is engaging the attention of automobile engineers, and during the year many suggested means have been offered for solving the difficulty. Probably the most promising of these is the method by which a small electric coil is employed to heat a small quantity of gasoline, which is thus evaporated, throwing into the cylinder a drier product which facilitates combustion and lessens crankcase dilution. In one of these primers, the electric coil is in the float bowl of the carbureter, and in another a cylindrical well is employed of slightly larger diameter than the pencil shaped coil.

Single ignition has been continued and has been improved in detail. The battery, breaker mechanism and coil have all been improved. One concern has developed a battery in which rubber separators are used with threaded wicks which carry the active material in the desired manner. Both breaker boxes and coils are faster than ever, this being necessary to take care of the increased crankshaft speeds at which engines are running. Platinum and tungsten for breaker points are scarce, making it difficult for manufacturers to keep up the quality.

Engine Balancing

Engine balancing has been studied more carefully than ever and counter-weighted four-cylinder engines are more numerous than before. Inherent balancing in which the rotary balance of the shaft is taken care of in design is also meeting with favor. In connection with the crankshaft the question of lubrication naturally arises, and it is interesting to note that pressure feed for the main bearings is increasing. While the percentage does not show up very high, owing to the fact that there have been some new models added which neutralize the figure, the proportion of engines with drilled crankshafts is increasing. In practically all cars selling at a price which renders it possible to afford the cost of drilling the shaft, this method is being used.

Leaving the power plant and in examining the rest of the chassis, it will be noted that the average wheelbase has increased by 7 in. It is safe to assume that this will not be the case another year. The fundamental reasons noted at the beginning of this paper preclude the possibility of again adding weight unless there is a very good reason for doing so.

As a matter of fact, the 1917 chassis has not followed out the curve of weight reduction which past trends would indicate. The abandonment of alloy steel wherever it is possible to get a reasonably satisfactory substitute of carbon steel may have something to do with this. Another reason for increased weight is in the deeper frame sections which are now employed, although this depth is necessitated by the longer wheelbase. The increased depth has been accompanied by a tendency toward longer springs of the semi-elliptic type. The latter form of suspension in combination with the Hotchkiss and other drives is growing in popularity. There are now only three cars which use full elliptic springs. Three manufacturers also continue to use the platform spring, there having been a notable conversion in this respect by one of the concerns making twin sixes. Hotchkiss drive is used on 53 per cent of present-day American chassis.

Clutch Operations Made Easier.

Clutch adjustments continue to decrease. The success of the light types now on the market has been proved. The problem of securing the lightest and most efficient clutch to transmit a given torque has been studied very carefully during the past few years, and at the present time clutches are easy to disengage. The fact that with the powerful clutch springs the clutch pedal can be disengagd on some cars with the hand indicates how the travel of the engaging members has been shortened. The use of fewer disks has contributed to the shortness of travel and is one of the factors which is making clutches lighter.

In chassis fittings a marked trend toward the more extended use of forgings for brackets, axle parts, etc., has been somewhat checked by the abnormally high prices asked for forgings at the present time. The result of this has been a temporary tendency toward an increased use of malleables. Manufacturers have been forced, in some instances, to change from forgings to malleables and in a few instances from malleable to steel castings, simply because of the difficulty in obtaining delivery of certain parts.

Malleable Castings Replace Forgings

Further than this, in view of the present prices of forgings, malleables are being used for some parts where the size is a matter of convenience rather than of structural strength. In a great many trucks which ordinarily would employ forgings, practically all of the frame brackets, spring hangers, motor brackets, etc., are of malleable iron. All parts which are in tension, and particularly those which are under shock, such as shackle links, are made from forgings if possible, or else from steel castings.

For the vital parts of all trucks and passenger cars forgings will continue to be used. This refers particularly to such parts as axles, steering connections, propeller shaft parts, etc. It is this condition which has put a check for the time being to the big trend toward forgings and stampings, but as soon as the war is over and conditions are relieved it is certain that the forgings and stampings will once again come into their own.

A very prominent engineer in charge of motor truck construction in this country states that the following rules guide him in selecting cast steel, malleable and drop forgings for small brackets, axle parts, etc.:

1. Cast steel is used for more important structural parts that cannot be forged. It must be made fairly heavy to allow for segregation in the castings, blow holes, etc. It should really only be used for complicated pieces.
2. Drop forgings should be used where very great strength is required, with lightness.
3. Malleable iron should be used for unimportant structural parts, such as spacers, packing pieces and the like; parts where cast iron itself would probably be strong enough as regards the actual work to be done, but not strong enough to bear transportation and rough handling.
4. In general, it is a very wise rule to use forgings as much as possible, as after the first cost of dies, they are usually found to be cheaper and much more homogeneous.

Bodies generally have been altered only in exterior lines; the beveled edge is typical. There has been a slight ten-

Express Service Over the Road By Motor Truck

Goodyear Has Seven Pneumatic-Tired Trucks Operating on Regular Schedule Between Boston and Akron—Round Trip, 1480 Miles in 6½ Days

By Joseph Husson

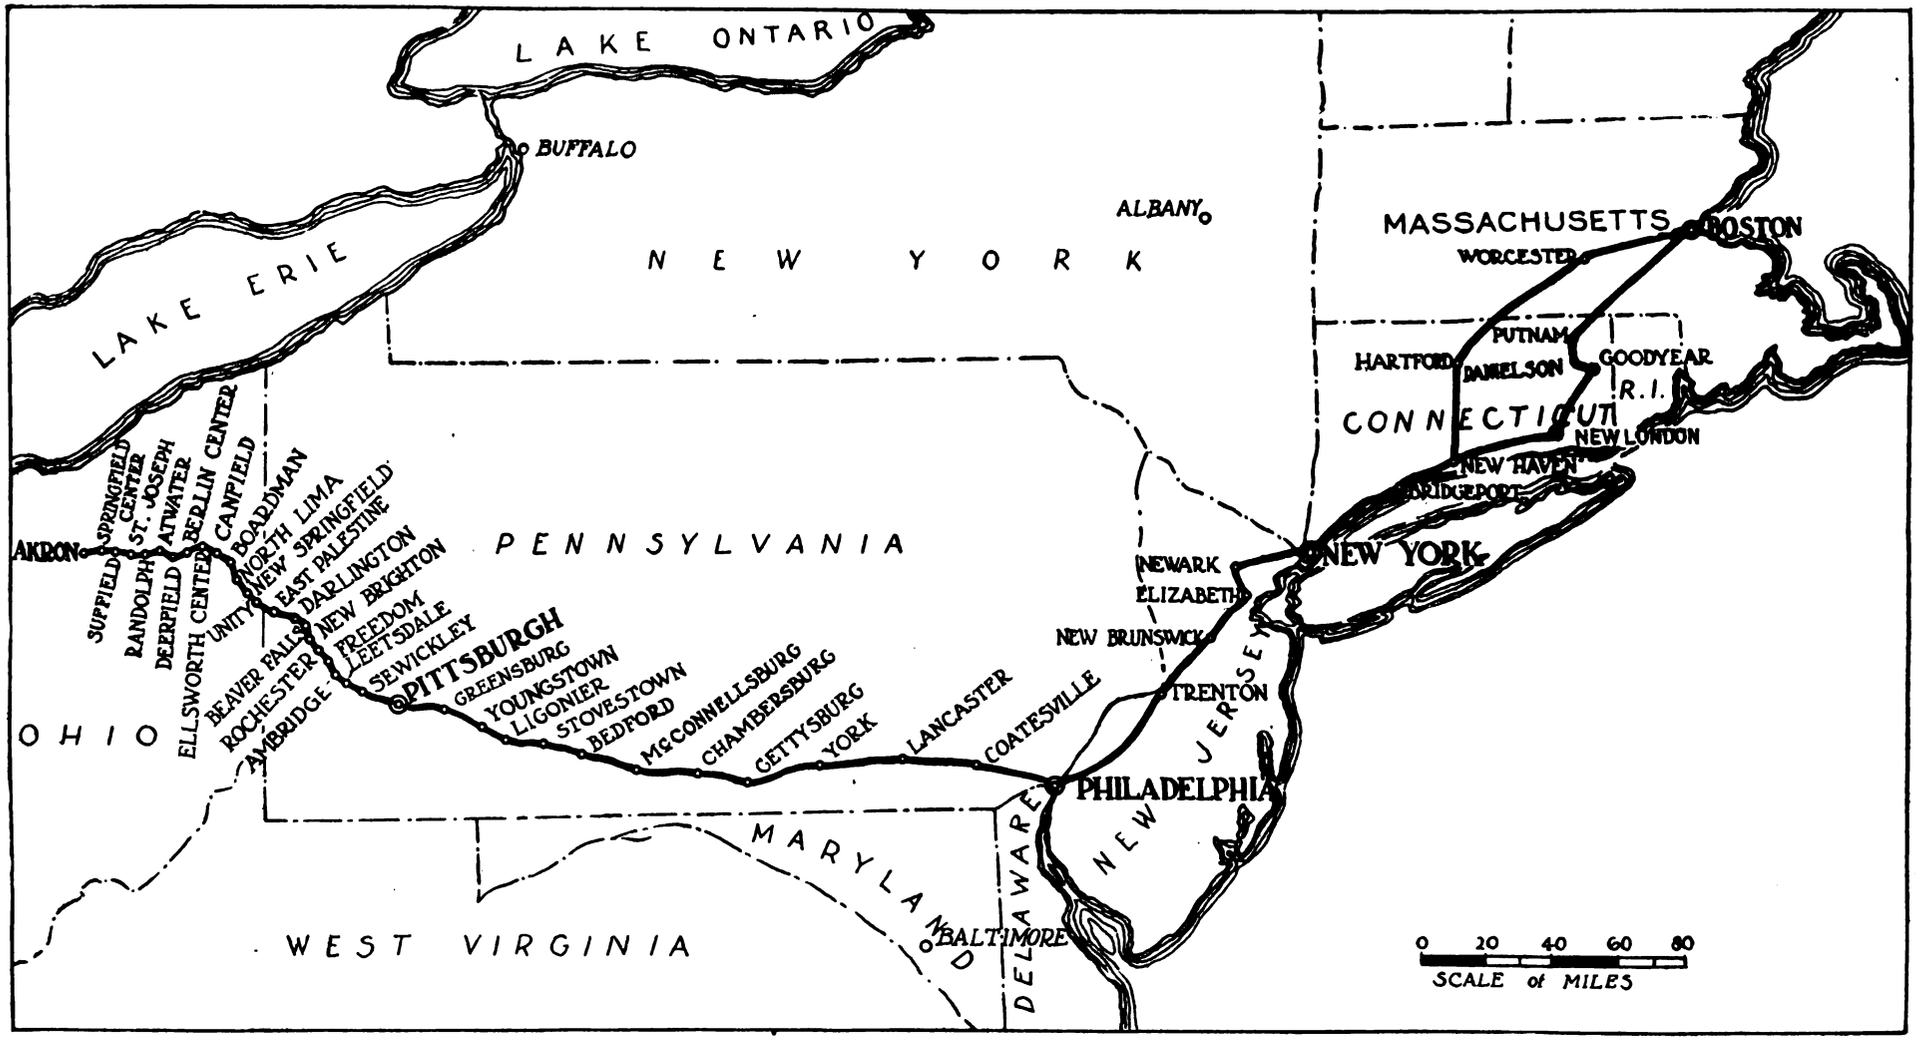
ONE of the greatest steps yet taken by any one company in the development of overland truck transportation has been made by the Goodyear Tire & Rubber Co., Akron, Ohio. That company began the operation of its first truck overland between Akron and Boston on April 9, 1917.

It now has seven trucks running overland between the same points on a regular schedule. What is even more important, these trucks have been operated through the deep snows of the present winter. Of course, there have been delays and interruptions of the service for short periods as required when breaking through new roads or when mechanical trouble on the trucks was encountered. But no truck that started from either end of the route has been forced to return and abandon the trip.

Tire Test Original Idea

The operation of trucks overland by the Goodyear company was started for a dual purpose. The principal reason was to test out the giant pneumatic tires being produced by the Goodyear company. The carrying of goods as a useful load was a secondary, but necessary, requirement in order that the tires being tested would have to undergo the same conditions as they would meet in actual service.

The makers of the first truck put into service, a 5-ton Packard, were very skeptical as to the feasibility of the project, but the Goodyear company insisted and finally started the vehicle on the first leg of its journey from Akron early in April of last year. The trip took 17 days. To-day the same truck and others of the fleet are making the identical run in 4 days, and in several instances a complete round trip of 1480 miles has been made in 6½ days. One of the late additions to the fleet, a 3½-ton Mack, recently made the trip between New York and Akron, a distance of 533 miles, in 60 hours, total time, and in 49 hours actual running time. The roads were deep with snow all along the route and the thermometer registered 13 below zero for a considerable portion of the run. Due to the fact that the truck was fitted with giant pneumatic tires all around, it was able to make a speed which would have been impossible with tires of the solid variety. Notwithstanding that the Pennsylvania mountains had to be crossed on the trip, the vehicle averaged 10.9 m.p.h. actual running time.



Two views of the 3½-ton Mack fighting its way through deep snows in the Allegheny Mountains. The upper illustration shows the great depths of the drifts and how they were cut through by the efficient Pennsylvania highway plows and men. The lower view gives some idea of the depth of snow on the level

Since the first truck was installed, the Goodyear company has added six others, the last going into service during the present week. Two 5-ton Whites were put into the work after the initial Packard had been bought. A 3-tonner of the same make was next added, followed by a 3-ton Packard. A 1½-ton White was then purchased, and recently a 3½-ton Mack. The latest truck to go into service is a second 3-ton Packard truck equipped with the engine usually fitted on the 5-ton size.

The experience gained by the Goodyear company during the 10 months it has been operating the trucks will go a long way toward making the opera-

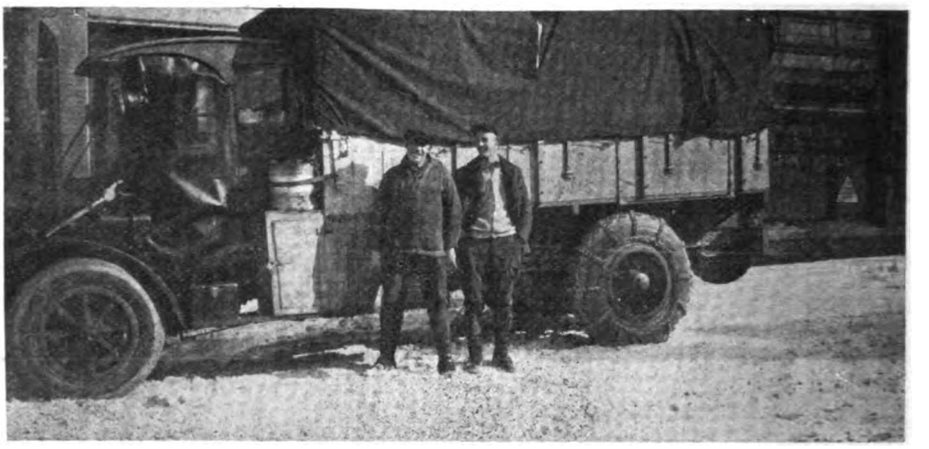
740-Mile Overland Route of Goodyear Trucks from Akron to Boston

THE southerly route taken by the Goodyear trucks as shown above, and which passes through Pittsburgh, Philadelphia, Trenton and New York City, is much longer than a route from Akron along Lake Erie and thence across New York State to Albany and east through the Berkshire Hills through Worcester to Boston. Still, it had to be followed, even though it costs more to ship goods a greater distance than a shorter distance, because of weak bridges and poor roads.

From North Lima eastward the route is the same as that followed by the Government war trucks now being driven from Detroit to Baltimore, except that the Government trucks leave the route at Gettysburg for Westminster, Md., and thence through to Baltimore. From Rochester, Pa., the route shown is the same as the Lincoln Highway.



From Philadelphia the route leads up through New England as shown, passing through Hartford and Worcester to Boston on the eastward trip with tires to the Boston branch and returning by way of Putnam, Danielson to Goodyear, Conn., where a load of tire fabric is picked up and carried back to the Goodyear factory in Akron. The complete run from end to end is 740 miles long.

Digitized by Google

tion of any additional trucks it may purchase more successful than ever before.

Saving Time All Important

Of course, the giant pneumatic tires have played a large part in the successful operation of the trucks, in that they have made possible greater speeds than could have been secured with solids. Greater speeds mean a saving in time, which after all is the fundamental principle because of which the transportation of to-day has advanced beyond that of past centuries. Time is becoming more and more important in the transportation of the world's goods. While it is infinitely cheaper, for instance, to ship goods by sailing vessels than by steamships, very few of our large industrial corporations find it worth while to trust the delivery of their goods to the will and caprice of the winds. Instead they prefer to ship by steamer, even though the cost is high, because of the reliability of delivery.

The 3-ton White on its way across country. Note the ordinary cab fitted, the extra tool box and tank on the runningboard. Giant non-skid chains are used on the rear tires, as shown

While of course the present delay in rail shipments is due to unusual congestion, set up by abnormal war conditions, it is the same time element which will be one of the greatest factors in the further development of overland haulage by motor trucks.

The cost per ton delivered will also be of great importance, and the pneumatic tire undoubtedly will prove to be one of the main factors in reducing the cost because of the greater speeds which they make possible and because of the lesser amount of repairs required on account of the greater cushioning which they provide for the truck mechanism.

The 10 months of operation of the Goodyear trucks brought to light many needed improvements not only in the tires undergoing experiment, but also in the trucks themselves. At first there was much tire trouble and the beading was found to be too weak to withstand the loads carried. Many of the tires were removed before their full life had been run and then cut apart to see what effects the wear had produced. Tire sizes and inflation pressures, side wall thicknesses and other points of construction were worked out as a result of the first trips made early last spring. As a result the tires now in use are giving satisfaction, although the experimentation is still being carried on with tires of even larger size, including 48 by 12 on the 5-ton trucks.

Speed and Power Essential

In the trucks a need was found for both speed and power. Due to the many steep ascents and long pulls which had to be encountered in the Pennsylvania mountains, it was found that the engines had to be more ruggedly constructed than those which were giving eminently satisfactory service under average conditions or on city streets. One particular part of the engine which gave considerable trouble at the start was the connecting-rods, which were in one or two cases twisted off and smashed the crankcases when they let go. The engine of the initial truck experienced this trouble and a new engine fitted with heavier connecting-rods has since been in continual service without giving any trouble.

On some of the down grades of considerable length it was found that the engine attained too high a speed when used as a brake and this condition made itself felt especially on the connecting-rods.

5-Ton Engine in 3-Tonner

The reason why the latest 3-ton addition to the Goodyear fleet is equipped with an engine of a size usually fitted on a 5-ton truck of the same make is to secure greater power and, at the same time, greater speed. The experience of the Goodyear company has been that the average engine fitted in the average 5-ton truck is not sufficiently large to pull a 5-ton load at the speed which pneumatic tires make it possible to run.

The question of the most economical size of load to haul has not been answered as yet, although the Goodyear company is running 1½, 3, 3½ and 5-ton trucks. It is entirely probable that continued experiments with the trucks will make it possible to reduce the sizes of some of the truck parts on account of the use of pneumatic tires, and at the same time carry the full load for which the vehicle was designed. The use of a 5-ton engine in a 3-ton truck fitted with pneumatic tires gives promise of securing some very valuable facts which will bear an important part on the future development of high-speed trucks for overland work.

A drift as high as the top of the truck. Note that the snow-removal work has been well done so that serious delays are avoided

The Goodyear trucks are now running on a 24-hour per day schedule except for the time required for the men to eat and to fill the fuel and oil tanks of the trucks. This has been made possible by providing two drivers, one of whom sleeps while the other drives. The sleeping compartment runs crosswise of the truck body directly in back of the driver's seat, and is entered through a sliding door in a partition extending to the roof. The sleeping compartment is well ventilated and is provided with a regulation single bedspring and mattress. The floor of the compartment is about 2½ ft. from the floor of the truck body and extends out into the truck body proper. Its rear side is boarded up so that there is no communication between the compartment and the truck body except by getting down onto the driver's seat and walking around to the truck tailgate at the rear. The space beneath the floor of the sleeping compartment is made use of to carry a portion of the load.

Pneumatics Make Sleeping Comfortable

While at first it might seem that sleeping on a 5-ton motor truck would be one of the most uncomfortable things a person could do, especially when the truck was traveling over rough roads, the drivers do not find it impossible because of the use of the large-sized pneumatic tires which make the truck ride almost as easily as some of the heavier makes of passenger cars.

The schedule of the runs in each direction is given on pages 458 and 459, and is laid out for a 4-day run in each direction. The trucks carry finished tires from the Akron factory to the Boston branch and other branches en route as required, and then run from Boston to Goodyear, Conn., where a load of tire fabric is picked up for the return trip to Akron. The drivers do not stay over at the eastern end of the route, but begin the return runs immediately. On arrival at Akron, each driver is given 2 days off before the next trip east is begun.

The route taken by the trucks, as indicated on page 458, is very interesting in that it is by no means the shortest route between Akron and Boston. A much shorter trip could be made by following the lake shore to Buffalo and thence down the Mohawk and Hudson River valleys to Albany, and thence across Massachusetts to Boston. Before the present route through southern Ohio, Pennsylvania and New Jersey was determined upon, the Goodyear company made exhaustive studies of both routes and found that it was not feasible to run 5-ton trucks on the Mohawk and Hudson valley route because of weak bridges.

Poor Bridges Lengthen Route

On this account considerably greater mileage now has to be covered than is necessary, and this, of course, adds to the cost of transporting the material. These conditions bring out very forcibly the great need for suitable motor truck roads, as pointed out time and again in articles appearing in these pages.

In the further development of overland truck haulage at times when the railroads are not so congested as at the present moment, the necessity for running over the shortest distance between any two points will be of paramount importance because of the cost factor, especially when the time element is not the most important consideration. The present route, as shown on page 458, differs from the route originally selected when the service was first established in that it takes a more southerly course between Akron and Youngstown, Ohio.

The latter change was made necessary by trouble encountered on an especially poor stretch of unimproved roadway outside of Akron for a distance of 10 or 15 miles. During rainy periods this road became almost impassable and caused such a large number of delays that it was found advisable to change the route slightly. A stretch of the poor road formerly covered is shown in the illustration appearing at the top of page 460.

A poor stretch of road 25 miles east of Akron gave much trouble until the route was changed

At first it was believed that it would be impossible to operate the trucks all year around on account of the deep snows encountered on both sides of the Allegheny Mountains as well as in the Ohio flatlands. This difficulty was really overcome to a great extent because of the fact that the route over which the Goodyear trucks are running is in part the same as that selected for the overland drive-aways of government war trucks from Cleveland and points further west, except for a short stretch between Youngstown, Warren and Ravenna, Ohio, as followed by the war trucks and the more southerly route as previously mentioned and taken by the Goodyear trucks. From Beaver Falls east to New York the route is laid over the Lincoln Highway, which passes through Ohio, Pennsylvania and New Jersey. The steepest grades encountered are mostly in the State of Pennsylvania, where the route crosses the Allegheny Mountains. It was at these points that it was expected the greatest difficulty would be encountered. The anticipated trouble was avoided because of the splendid manner in which the Pennsylvania highway authorities kept the route open as a war measure to assist in the delivery of the government war trucks.

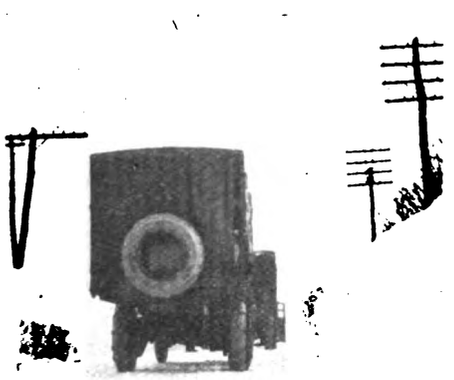
Pennsylvania Snow Removed

Pennsylvania took a leading part in the snow-removal work and arranged for new methods, new appliances and new schemes to keep the roads clear. This work was carried out under the drection of W. D. Uhler, chief engineer of the Pennsylvania State Highway System. His department is kept fully informed at all times by the Pittsburgh weather bureau as to weather conditions and approaching storms.

As soon as word was received of the approach of a storm the maintenance division immediately sent notices to the various engineers through whose districts the State highways passed. They in turn arranged to have their men and equipment ready so that no time was lost in fighting the storm. They worked on the principle that it was better to fight the storm while the snow was still falling than to wait until it had become packed hard.

The equipment used consisted of horses and scrapers, motor truck snow plows and a goodly number of able-bodied shovelers. Some of the equipment employed and the manner in which the roads were cleared of snow are shown in several of the accompanying illustrations.

Mechanical equipment was used in every case where possible, and in some instances both day and night shifts were provided in order to have the road cut through heavy drifts before the truck trains arrived.



Trucks Equipped with Shovels.

At points in Ohio and New Jersey, where the roads were not so well cleaned, the truck crews oftentmes had to perform some of the snow removal work, and all of the Goodyear vehicles were equipped with shovels and other necessary implements for doing it.

With the advantages of overland motor truck transportation brought home in such a convincing manner this winter, and the work which has already been done toward the removal of snow off the main roads in the rural districts, those owners of trucks who operate them over the roads next winter will undoubtedly find conditions conducive toward more economical operation.

Of course overland haulage during the winter months, especially during the extremely cold periods, is a strenuous service and demands that the greatest possible comforts be given the drivers. The Goodyear company has met these conditions by fitting a closed-in cab on each of its trucks and by providing a heater so that the cab may be kept at a temperature sufficiently high to prevent driving and sleeping from becoming a hardship. It also found it necessary to provide a winch on each of the trucks together with 500 ft. of rope, block and tackles, etc., in order that a mired truck might be extricated with the least difficulty.

The Goodyear company carries full loads both ways on each of its trucks, and this condition will have to be satisfied in the future development of overland hauls for such distances in order that the cost may not become altogether prohibitive. As the work extends to larger and larger fields, it will undoubtedly divide itself up into two main classifications. These include, first, the use of privately owned trucks such as those of the Goodyear company, carrying Goodyear goods, and, second, the employment of commercial vehicles operated by specialists solely in overland haulage.

Over the crest of one of the many mountain grades. Note how the spare tire is carried on the tailgate

Must Prepare Now for After-War Trade

Scarcely Any Portion of World but Will Look to United States—Manufacturers and Industries Must Co-operate for Export Business —Importance of American Merchant Marine Now Coming Into Being

By J. K. Clark

AN ATTEMPT to outline to-day, even in the most general fashion, any phase of international trade after the war is bound to meet with disapproval from more than one quarter. There are those who cry treason whenever a thought is given to any subject except the pursuit proper of the war, while others object to such an attempt as above indicated on the grounds that so many conditions of life and industry after the war are impossible to forecast to-day that all speculation on the subject seems useless.

Those in the first group include many of those who, while sincerely patriotic, refuse to see any need of preparedness up to the very moment when war could no longer be averted, and whose viewpoint has been proved to be shortsighted. The second class of objectors can be answered by pointing to the many new features in industrial and commercial life which the war has brought forth in every country and which are bound to continue after hostilities will have ceased—such as the generally standardized production and distribution of public necessities, the increased centralization of government in each country and the tendency to make every land able to exist on its own native resources as far as possible; finally, to the fact Germany has shown to the world the value of preparing for war in times of peace, and is even now preparing in many respects for the day when international commerce shall once more be resumed. Nor is Germany alone in this class; Great Britain, France and Japan are making keen efforts to be ready for that future time. It would be criminal if America in this regard, too, should lag behind and be required to start future world trade with a handicap.

Expects Closer Combinations

Indications are that standardization of production will by far surpass the state which obtained in our industries four years ago, that quantity manufacture of many articles will be desired because of the new and grander scale on which our factories have learned to work since 1914. With a better regulated financial and transportation system which the war has given us, production and distribution in this country will be much easier, provided there is a sufficiency of capital. Combinations of industrial interests will be looked upon with more favorable eyes by public and government; and industrial policies, planned ahead for considerable periods, will become possible as never before. Very likely, ours will be a much improved merchant marine compared with the days before the war, and it will be the part of the government to so regulate the relations between shipping and seamen's interests as to develop our overseas trade to best advantage.

These conditions will exist no matter how long the war lasts. America will be financially and industrially the strongest country in any case, partly because the United States had to stand three years less of war's burdens than any other nation, partly because its resources are superior.

Turning to the world market, it will be necessary to divide it in a number of regions, which shall be discussed one after the other. They are, beginning on this continent:

Canada; Mexico and Central America; South America; Great Britain; France, Spain and Italy; Germany, Austria-Hungary, Bulgaria and Turkey; the Balkans south of these states; Scandinavia; Holland and Belgium; Russia and Rumania; British Africa; French Africa; India; China; Japan; Australasia.

Canada in Pan-American Group

Canada will be drawn more closely into an official or unofficial Pan-American group of states and will find reciprocal freedom of trade to greater advantage than before the war. With ocean freight rates rising more than railroad rates, and following the universal necessity of economy, it will be easier to deal with the Dominion.

It is fair to assume that the Mexican problem, like so many others, will be solved through the war. In this case the United States is geographically and financially in the best position; already our interests in Mexico are of imposing magnitude and peace will increase rather than decrease them. Considering its natural wealth, Mexico's indebtedness is very small, and as soon as a fairly stable government is developed there, trade will be relatively easy yet profitable. As to Central America, there is every indication of our relations with these states growing more intimate every year.

With an ample merchant marine there should be no difficulty in building up a huge South American trade. This applies especially to those countries which are interested in commerce via the Pacific, where it will take the energies of both Americas to hold their own against keen Japanese competition. Industrial advance in South America will probably reduce the present insularity of the countries and bring Brazil and possibly Peru and Paraguay into closer affiliation with the leading European countries than with North America. One factor which will make South American trade easier, speaking generally, is that the war cannot fail to strengthen that continent's commercial ties with Europe and Asia, develop their industries and make them financially stronger so that in dealing with them long-time credits will not be as necessary as heretofore. Likewise, a great deal of provincialism still existing there will vanish; it will be easier than formerly to do business in the English language.

The trade with Great Britain and Ireland will probably be somewhat lessened after the war. The United Kingdom, if it wishes to re-establish its former dominating position as a creditor nation, must draw as far as possible on its colonies for raw materials and half-finished products. Likewise, if England is to retain the

Digitized by Google

commercial leadership on the sea, she must lay the greatest possible stress on the lines of communication between the Isles and the British colonies, but also with South America, Russia and the Far East. Naturally, sound business sense will force the English to tranport most of their imports on their own merchantmen, of which fewer can then be directed to plying between England and the United States than before the war. Trade with Great Britain will be much more in meat, copper, hides and similar merchandise than in finished products of any sort, and in these goods trade will possibly be smaller than five or ten years ago.

Increased Field in Europe

An increased field of foreign commerce awaits us in Western Europe—France and Spain, as well as Italy. The two countries among these which are now belligerents will naturally prefer, unless price makes it impossible, to deal with America than with Central Europe, or even via Central Europe with the East. Both France and Italy have been less able or forced to develop the enormous automobile industries which have sprung up during the war, here, in England and in Germany; and with their supply of horses diminished and few automobiles emerging from the war capable of further service, they will represent excellent markets, if they are given a fair credit. Spain is in a similar position, because she is removed from the industrial centers of Europe, and having built up a notable merchant marine of her own, will be able to buy here in great quantities and transport her purchases more cheaply than she could by rails over a few hundred miles. Therefore, Spain should offer a splendid market.

Germany and her present allies will probably continue to be more or less closely affiliated in a commercial way, except if the war is continued to the point of their absolute ruin. Unless indications are very misleading, Germany is even now preparing to make up for the losses in her merchant marine, and is said to have built many vessels already. If so, she will commence heavy buying, not only of raw materials, but also of all such finished products which the world market affords at relatively low price—for instance American automobiles and machinery—so as to release the greatest possible proportion of her own production for the markets in Eastern Europe and Western Asia, South America and the Far East. All the sentiment in the world will not be able to prevent this; for Germany is in a favorable position to pursue such a policy, due to her having husbanded her gold during the war.

Might Find German Market

As maximum sale and production is the principal means whereby we may best hope to assume and maintain a leading position in any special world market, the United States automobile industry is likely to engage in such a trade, even if it be to Germany's advantage temporarily; for the latter country will, based upon developments there during the war, so organize her finance as to release a maximum of credit for foreign trade, basing internal commerce principally upon government regulation and "clearing-housing" of materials and good-will. Austria-Hungary will, very likely, be very much under Germany's control; while Bulgaria is likely to try and retain as much independence as possible by keeping in touch with the international, and not only the German market. With Turkey, there is also a possibility of coming to commercial arrangements in spite of German influence.

It is a safe assumption that the southern Balkan states, Serbia, Montenegro, Albania and Greece, will be in a state of full independence after the war, and, offering free access to trade from land and sea, the law of supply and demand will hold valid there in a broad way. Each of these countries will, as Asia is invaded from East and West, be transformed from a purely agricultural condition to a state of budding industrialism, offering a fruitful market to the foreign producers of divers modern machinery. In a section as mountainous as the Balkans and now deprived to a large extent of its former means of animal transportation, there will be a strong demand for motor vehicles, especially since the railroads which these countries require for their development cannot be constructed as rapidly as needed. Of course, business there will call for long-term credits; but with a certain amount of business regulation by representative governments there should be no reason why such credits could not be extended.

There still remain to be considered the Northeastern countries of Europe. The Scandinavian countries, Denmark, Sweden and Norway, have been forced by the war to form a kind of entente cordiale, which most likely will survive the war in some form or other for the sake of economic benefits. Trading arrangements and conditions in these countries will be very much alike. All three will, provided they continue to remain neutral to the end, be as progressive and as prosperous as any in Europe, and in need of, as well as able to buy, plenty of modern equipment of every sort.

Holland Buys Diplomatically

Holland, while economically as strong as the Scandinavian countries, will have to maintain well-balanced business relations with both sides of the present belligerents, due to her geographical position. She will always require many products she herself is unable to turn out; but being forced to keep on the best possible terms with everybody, her buying will not be guided by purely business considerations alone. The chances are, however, that general satisfaction will best be maintained by her buying certain raw materials and finished products from one country and others from another—say, cotton, wheat and machinery in England and America; and coal and its divers products, sugar and rails in Germany. These examples are, of course, taken rather at random and only for purposes of illustration.

Belgium, even if she should desire to maintain a similar basis of free or equal trading, is bound by such strong ties to America and her allies that her business will be principally with these countries. With a seaboard of her own, and at least Great Britain backing such a policy, she will probably keep as well separated from Germany as any country in Europe. Belgium is a prosperous country under normal conditions, which the peace arrangements undoubtedly will restore, and the work of reconstruction will create a manifold market there, in which American trade is bound to share to a very large extent.

Russia at this moment is rather an unknown quantity; but order is bound to return, and with order must come a period of unprecedented advance. Already Russia is preparing to develop an efficient railroad net. The land is being so redistributed as to make possible profitable farming by its small owners who will be ready to invest in all modern devices rendering their lives broader and more enjoyable. Indeed, before the war, the Russian masses were highly conservative; but even before the revolution, war itself, and the contact with Germany and her up-to-date methods, had served to educate the Russians to the meaning of the twentieth century, technically speaking. There will be a wonderful market there for those who understand conditions and have foresight

Digitized by Google

enough to develop the correct ways and means of dealing with them.

As for Rumania, she will be economically an appendage, either of Russia or of Germany. A great deal of her needs will come from the latter country, but as Rumania possesses a coast in the Black Sea (which body of water will be brought to greater importance by Russia's becoming a commercial nation), she will have an opportunity of ample overseas trade.

Africa Expanding Market

The African colonies of Great Britain and France will very likely attain a somewhat greater liberty than heretofore, and a great many requirements of their further evolution will be supplied by the United States. The colonies will *have* to be developed as rapidly as possible, and France and England will welcome any help from without that renders them powerful markets within the shortest possible time. To reach this point, the colonies will have to be possessed of modern industries, carried on by modern machinery, which America can cheaply and rapidly supply.

With the minimum of shipping the world will have ready when the war ends, Australia will have to deal with her nearest neighbors as far as possible—and here is the chance for America and Canada. There should be opportunity for similar agreements between the United States on one hand and each of these colonies on the other; and to a certain extent England will acquiesce in, if not support, such a policy; at least for a limited length of time.

Finally, there are Japan and China. The war has strengthened very much the ties which bind the latter to the former and, while the once open door may still be ajar, it will take the co-operation of the Western powers to keep it so. Japan is to-day in a position to depend on herself, or almost wholly so, and she is rapidly developing Chinese resources which are of service in this respect, and of course tends to monopolize Chinese resources as far as possible. Needless to say, China's development must soon reach a point where, in consciousness of her own advantage, she will demand and receive in a fair measure the blessing of the open door, which has been curtailed more and more since the day Japan entered the war. When China reaches this stage the nearest hand she will be able to grasp will be that of America; and it is to prepare for that time to which our efforts must be directed.

Undoubtedly, after gaging the divers conditions, opportunities and peoples of the countries of the world, it must be granted by even our ultra patriots and commercial pacifists that we must give some thought to the methods of the near future. Attention has been called by several writers, especially by former Ambassador Gerard, to Germany's after-war plans. They include industrial combinations for collective buying and selling abroad, and it goes without saying that unless we want to be the losers Greek must meet Greek. Individual firms must deal with other countries through government-controlled agencies for buying and selling, and the hand of the government will insure the general public against ill use of their combinations by such firms.

Centralize Exports

For instance, all automobile manufacturers desiring to export to France should act through a central agency and exhibition in Paris, with possible branches in other large cities, familiarizing the French public with our wares. If Frenchmen desire to buy here direct they will do so through a similarly organized "purchasing embassy," whereby neither party is at an advantage or disadvantage by its or the other's monopoly.

It is for developments along these lines that we must now begin to prepare, lest they are to surprise us when they come about. The manufacturing, distributing and governmental influences should now begin to work hand in hand toward the planning of efficient organizations whereby an ever greater world trade can be built up.

Automotive Design and Transportation as Developed by the War

(*Continued from page* 455)

dency toward improvement of the front compartment, a thing which has been fought for in some quarters very strongly in the past three years. Where there has been additional space gained, this has usually gone into the front compartment rather than the rear. The remarks which were made a year ago regarding the front compartments, however, still hold good to a large extent. The driver's seat is generally comfortable after he has seated himself, but while entering and leaving the seat the driver is apt to be uncomfortable.

The color situation is a little better now than it was a year ago, although it is not so easy to secure the desired pigments even now. There are a number of brighter colors now in evidence, showing the tendency toward individuality, particularly among concerns which make in the neighborhood of ten to fifteen cars a day.

One of the tendencies which may be predicted in body design is that the cars of the future, at least of the touring variety, will be of the two, four or six-passenger type. This is highly desirable from the standpoint of beauty of outline, as it gives a car which does not have to have the rather unsightly wheel housings. A two, four or six-passenger body can be swung between the rear wheels, giving a narrow gas line.

Manufacturers will do very well to put out a few special bodies wisely scattered through the country on their stock chassis. There is always a market for these cars that act as potential advertising for the company and can always be sold at a figure leaving a handsome profit. The dealer welcomes a car of this kind for his show room, and it has been the experience of companies that have made these cars that there is always a great amount of competition between the dealers as to who is to be the one to get the special body.

There is still room for improvement in door fitting, judging from an inspection of the cars on the floors of the show. This same condition held true last year. Doors will be tight on one side of the body and loose on the other. The shape of the backs of the seats can also be further improved, as the bulge of the back should fit the body. With respect to closed cars, and particularly the convertible type, we seem to be in an era of uncertainty. Manufacturers do not know whether the majority of buyers want a permanent pillar or a removable pillar in the sides of the touring sedan models. This popular car has had a large sale this season and will continue to have equal success next year, according to present indications. There has been a considerable amount of argument in favor of the permanent pillar, in that it can be made lighter and at the same time more substantial. This seems to be a matter for education on the part of the purchaser as well as development by the manufacturer.

Summing up the entire situation, it may be said that we have entered upon a new era. The improvements in design up to the present will serve as a valuable guide in the new period which the war has brought on. The car which will carry its load with the least surplus weight, with good acceleration ability, without undue length, with an engine of ample but not excessive displacement, and which will give the utmost in performance and comfort for the money expended will be the one which will best meet the new conditions.

The Stanley Steamer in New Form

Fitted with a Body of Modern Design of Either Four or Seven Passenger Type—Piping System Greatly Simplified

A NUMBER of detail changes have been made in the Stanley steam car for this year which have made it a considerably improved product. Probably the most radical changes are in the body and in the piping system. The body has been brought thoroughly up to date and is now an example of the straight line type, designed by George J. Mercer, who is well known as a contributor to AUTOMOTIVE INDUSTRIES. The cowl has been raised, as has the hood, making the radiator higher. The V shape at the front of the radiator has been made sharper so that it now has what is known as the Mercedes line. The remaining part of the car is of the straight sided, flat, beveled edge type with square corners on the doors, full crowned fenders and a cowl board for gages, speedometer, etc. The windshield is sloping.

Instead of making the car in three-, five- and seven-passenger styles as previously, only two bodies are offered now, the seven passenger and a four passenger. There is no roadster model and no five-passenger model. The four-passenger model has both front and rear doors and where the back has been moved up to make it close-coupled, a sweep has been given the back, giving a modified turtle back.

Seven passenger and four passenger Stanley cars

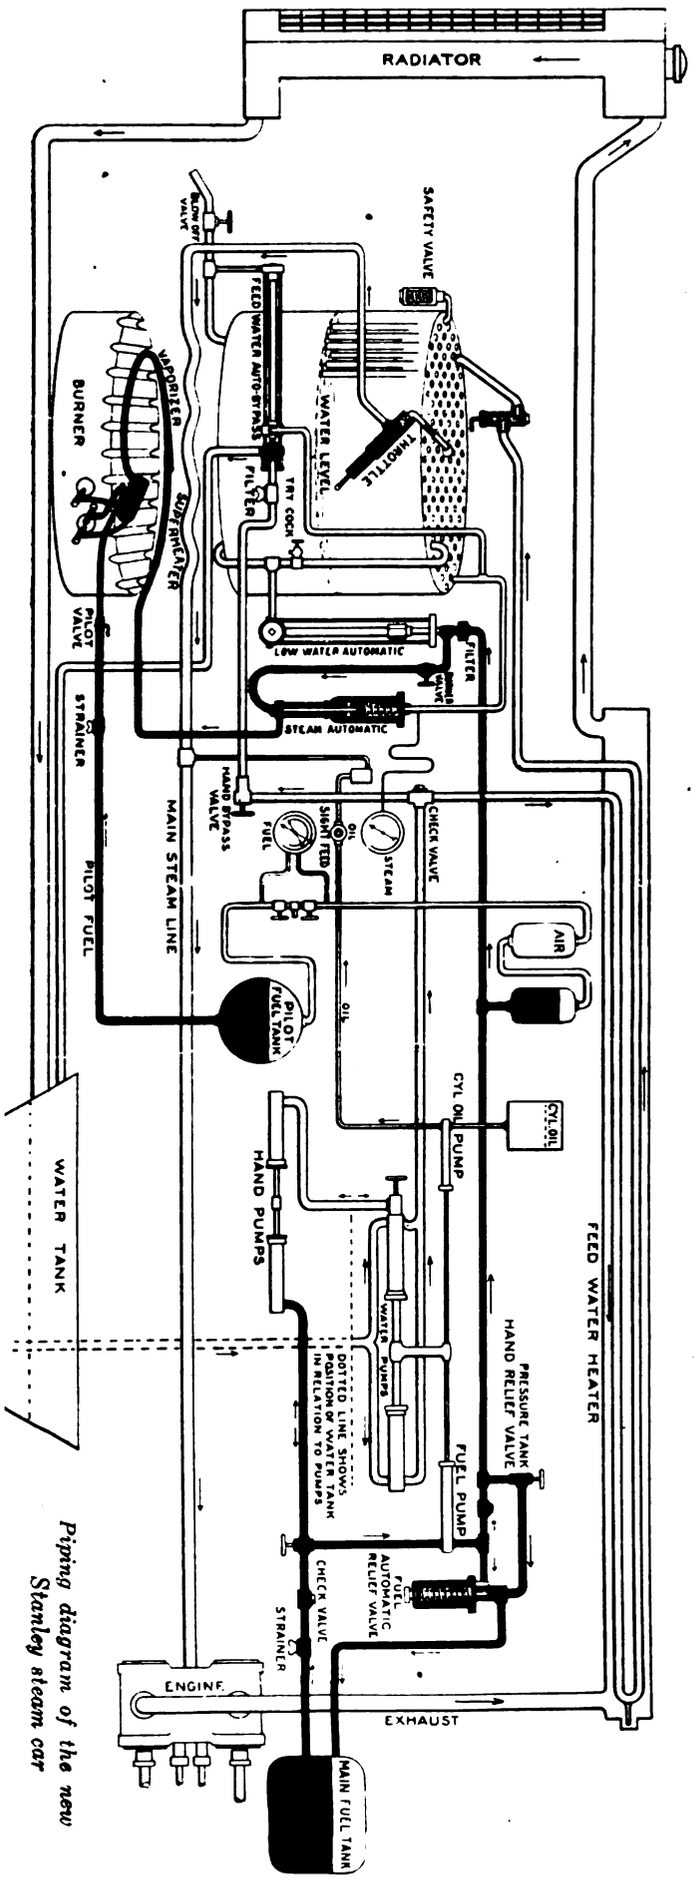
From the owner's standpoint probably the biggest change is in the electric device for heating and igniting the pilot vaporizer. This operation was formerly accomplished by means of a Prest-O-Lite tank. This has been done away with, however, and current is now furnished by a Willard storage battery to a resistance coil controlled by a button. The arrangement is such that the current cuts itself out after its mission has been accomplished. With this modification of the burner it is now possible to use kerosene in the pilot. If desired, however, gasoline can also be used or a mixture of the two fuels. Pilot burner and vaporizer are now a unit and can be easily removed at any time without disturbing the burner.

Piping System Redesigned

From an engineering standpoint probably the cleaning up of the chassis is the most noticeable improvement in this year's Stanley car. By redesigning the piping system it has been possible to reduce the total length of piping by about 60 per cent. The piping itself is now also standardized as to size and fitting and the units themselves have been made much more accessible.

In the fuel line the vaporizer coil has been omitted and the so-called master valve as well. The fuel line is controlled by the main burner valve on the instrument board, which not only does the work of the fuel valve, but also incorporates the work of the master valve. The pressure tanks on the fuel system have been moved forward and are now in front of the pump box. This cuts out a complete return piping system to these tanks and shortens the connection very considerably.

In the water system the piping has been standardized as to size and is now 7/16 in. throughout. The front and rear pumps are now interchangeable and the system has been improved so that any sound or water hammer is impossible regardless of the car speed. The pumps are connected so that they now work together instead of independently as before, and this has simplified the water line considerably. The three-tube water indicator formerly employed has been replaced by one of new design of the float type, which always indicates the correct level of the water whether the car is under steam or not.



The piping diagram herewith shows the new system completely. It should be pointed out that this is in diagrammatic form and that on the car the units are somewhat differently located than in the illustration. For instance, the water tank is right beside the power pump, instead of below, as indicated in the diagram. The rear by-pass valve has been eliminated, and both the rear and front water pumps are controlled automatically, so the driver no longer needs to use a rear by-pass valve as heretofore.

Very few changes have been made in the steam system. One important change, however, is in the super-heater, which is now arranged in a series of parallel loops instead of a coil, as heretofore, and the steam on leaving the super-heater goes direct to the engine instead of passing up through the boiler. With this arrangement a greatly improved job is obtained, from an accessibility standpoint. The whole super-heating system can be taken out by removing three bolts, and without disturbing the burner. The super-heating tubes, furthermore, are made of an improved heat resisting metal, that is practically unaffected by the continued high temperature under which they operate.

Fuel System Rearranged

The fuel system has been greatly simplified by moving the pressure tank up to the pump. This places the units of this system in the most direct arrangement and the air pump line to the pressure tank is only 18 in. long instead of being the entire length of the chassis. The fuel automatic is under the floor in the rear, so that the return line from the automatic can be very short. The fuel pump is practically unchanged,

Digitized by Google

Piping diagram of the new Stanley steam car

and the fuel flows straight to the burner, passing the fuel automatic, pressure tanks, low water automatic, and steam automatic on the way. It enters the vaporizer on the rear end of the boiler and from it passes to the burner. The pilot fuel system is now just one straight tube from the pilot tank to the pilot burner without interruption and with but one valve. There is a loop in this pilot line directly over the pilot burner, which acts as a small vaporizer.

Specifications of the car are given in the accompanying table:

Car	Price
Seven-passenger touring car	$2,600.00
Four-passenger	2,550.00
Chassis only	2,225.00

MECHANICAL SPECIFICATION TABLE

Boiler	Stanley fire-tube type welded construction, 23 in. diameter.
Burner	Drilled type, burning kerosene or gasoline without alteration.
Pilot	Kerosene or gasoline with small tank of four gallons capacity.
Engine	Two cylinder, 4 by 5 slide-valve type double acting and geared direct in the differential ring gear.
Water tank	24 gallons capacity.
Water mileage	150 to 250.
Pump	Driven from rear axle at one-quarter engine speed.
Light	Electric throughout with Willard battery and Apple electric generator.
Steering gear	Warner.
Wheels	34 by 4 artillery type cord.
Tires	35 by 4½ straight side.
Body	Aluminum.
Color	Royal green.
Fuel tank	20 gallons capacity.
Brakes on rear wheels.	
Front axle	Timken.
Rear axle	Stanley, with Timken and S.K.F. bearings.
Wheelbase	130 in.

Analysis of Labor Motives

EIGHT human instincts must be reckoned with in handling the labor problems of a factory, according to the views expressed by industrial relations experts at a recent conference in the Brooklyn, N. Y., Academy of Music. The experience of personnel managers in the past few years shows that it is old-fashioned and unintelligent to assume that labor is interested only in the dollar and cents side of its work, although that is a fundamental consideration.

The chief influencing factors in the life and work of the employee were outlined as follows:

1. Parental Instinct.
2. Sexual Instinct.
3. Workmanship Instinct.
4. Possessive Instinct.
5. Aggressive Instinct.
6. Submissive Instinct.
7. Herd Instinct.
8. Instinct of Curiosity.

The possessive, parental, and sex instincts may be considered as those most closely related to the wage problem. Every worker wants more money for himself, so that he may establish a home, and so that he may bring up a family. Where the wage fails to satisfy, at least in a measure, these instincts there is sure to be discontent and lack of co-operation. A man's interest in his family will also make him seek a community where housing and social conditions are good, in preference to a community which is deficient in that respect, even though the wages at the latter place are somewhat higher.

The herd instinct, better known among laborers as "solidarity," is an increasingly important factor in the labor problem. It is one of the most potent forces in unionism.

The aggressive instinct and the instinct of curiosity are two forces that a capable personnel manager will be able to turn to great advantage, both from the standpoint of the organization and the workers themselves. A laborer who has curiosity is interested in his work, and one who is aggressive is capable of a high degree of production if he is placed in some position where his powers can be exercised. The so-called "agitator" can usually be an asset to the organization if the employment department is well-managed.

On the other hand, the submissive instinct is probably the most useful of all, viewed from the angle of large scale production. The rank and file of workers take what their jobs bring to them, through inertia. Keeping a working force enthusiastic and interested in the organization is a big task, but the routine of the industry is greatly facilitated because the average worker takes orders unhesitatingly.

MANUFACTURERS' MERCHANDISING

The Farm Tractor Instruction Book

It Must Be Illustrated with Photographic Reproductions, Should Be Pocket Size and Should Have Work-Proof Covers—Should Tell How to Make Tractor Repairs

Part II

LAST week we told how H. L. Thomson advised tractor makers to deliver their instruction books to the farmer. This week we give Mr. Thomson's practical suggestions on the writing of an instruction book.

Covers—A poor cover is the worst possible advertisement to a tractor instruction book. When the farmer needs it his hands are dirty. They have grease on them. They may be wet with water or mud. If the cover is poor paper it just melts out of existence and is gone. Make the cover oil proof and water proof.

Size—There is nothing so good as a pocket size book. It should never be of that size that it has to be folded to be carried in the standard size of pocket.

Simple Language—Too many books are written as one engineer would talk to another engineer. They talk about mean effective pressure, volumetric efficiency and bearing tolerances or piston limits, that cannot be understood by the user. Such language turns the user away from the book rather than magnetizing him.

The Simple Story—Do not use blueprints. The farmer never made one in his life and cannot read them. Use X-ray wash drawings instead. Get a sketch artist and make perspective drawings of parts and systems. Do not spend thousands of dollars on good engineers and then not hundreds on good illustrations for an instruction book.

Oiling Charts—Use large charts showing every bearing and tell in plain figures how often each should be oiled. Have arrows pointing to the bearings and print the period of time (in colored ink) when these parts should receive attention.

The True Story—DO NOT CAMOUFLAGE. Do not be so foolish as to write your book as if nothing would ever go wrong with your tractor. That is just the way to get in bad with your buyers. Parts of your tractor and every other tractor will go wrong. If you attempt to deny it you are like an ostrich hiding its head in the sand, vainly imagining that because it cannot see that it in turn cannot be seen.

Major Repairs—Tell in the book how to make major repairs on your tractor. Do not forget that with the tractor the farmer must be the expert. When a tractor goes wrong you cannot drive it to the nearest garage, as with a motor car or motor truck. No. You must tell the farmer how to do the job. It might be how to take up a lower connecting rod bearing. Give him every step in the process. Number them 1, 2, 3, etc. Tell him how to scrape a bearing. It is not enough to say: "Take out the crankshaft and with the ordinary scraper smoothe the bearing until it is round and fits the shaft." That is no good at all. Illustrate how the scraper should be held. Tell how to mark the bushing to show where scraping must be done. Tell every step in the job. There may be ten other important jobs on your tractor that must be repaired. Take ten or twenty pages, if necessary, to tell how these are done. Every dollar you put into such may save you thousands of dollars in service later.

Book Arrangement—So often the tractor instruction book is poorly arranged. Many have no logical arrangement. Decide on some logical order of taking up the entire tractor. You may first take up the motor, then the transmission system, and lastly the chassis, or you may use other sequence, but get some order and adhere to it.

Hitches—Every instruction book should carry instruction with good illustrations on hitches. Illustrate this fully, and whatever instruction you have regarding the hitch print it right below the illustrations, so that it will all be easy to follow.

Laying Out Fields—The book should contain instructions on how to lay out field for tractor plowing and cultivation.

Timing Charts—There should be timing charts with the complete wiring system. If possible, lay out these charts as simply as possible. It is not a bad idea to place the chassis in dotted lines back of the instruction diagram, so that it is easier to follow the circuits. Place the complete system in one chart, if possible. Carburetion charts explaining how to make carbureter adjustments should be included.

WE take the liberty of adding one suggestion to the excellent ones given by Mr. Thomson. Perhaps the first is that the book should be psychological in its arrangement. That is easy. Here is one of the first laws of psychology:

GO FROM THE WHOLE TO THE PARTS.

That means give a general conception of the entire oiling system of the engine, for example, before you attempt to tell all about some little detail of that system.

Do not try to explain the pressure control valve in the oiling system before you have explained that it is a full pressure system in which an oil pump delivers oil under pressure to the main crankshaft bearings, and that from these the oil enters the hollow crankshaft and is delivered by centrifugal force into the wrist pins and thence is sent by pressure up the connecting rods to the wrist pins, with a safety valve to bypass some oil when the pressure rises too high. With a general conception given, then pass to details.

This means going from the whole to the parts.

Going from generals to particulars means the same.

Problems of the Hotchkiss Drive

Side-Sway Has Been Practically Eliminated by the Use of Flat Semi-Elliptic Springs—Brake Linkages Are Causing Some Trouble Owing to Change in the Center of Oscillation

By J. Edward Schipper

IN spite of the fact that the Hotchkiss drive continues to grow in popularity, and is proving, in the main, a very satisfactory arrangement, both from the standpoint of weight saving and that of satisfactory service, there are certain problems connected with it that remain to be solved. During the first two years the drive was in general use the matter of side-sway was probably the most important difficulty which had to be dealt with, but this has been solved to a large degree on present installations.

The side-sway difficulty has been overcome chiefly by the use of semi-elliptic rear springs which are almost flat when in the normal riding position. Springs of this type are relatively rigid sideways and interpose a considerable resistance to periodic side-sway. It is, of course, necessary to back up the springs by a substantial structure at the rear of the frame. This is done by thoroughly bracing that portion of the frame which extends back of the rear cross member.

It must be remembered that the stresses imparted by the car in its tendency toward side-sway are all transmitted to the rear end of the frame, and, as the rear cross member is some distance from the rear, it is quite certain that a weaving action will take place unless there are bracketing members to take up these stresses. A crossbar placed as closely as possible to the rear end of the frame is one of the best means of securing rigidity at this point. Crossbars are more serviceable in this connection than gusset plates, which are susceptible to rivet troubles.

Difficulties With Brake Connections

Difficulties with brake connections are always encountered with the Hotchkiss drive. This is only natural, considering that the center of oscillation shifts constantly, owing to the flattening and elongation of the spring and to variations of braking torque in connection with the reaction of the spring. When the brakes are tightened on the rear wheel drums there is a tendency for the wheel to carry the axle housing around with it. Thus, if brake levers on the rear axle extend upward, there is a tendency to shorten the brake rod length, as the housing will move slightly, owing to the flexure of the rear springs. On the other hand, if the car is moving backward and the brake is applied, there is a tendency for the brake rods to lengthen. Should the brake levers on the rear axle extend downward, the above conditions are reversed for both forward and backward travel.

If the centers of oscillation could be fixed so that changes due to the flexure of the springs could be compensated for in the braking mechanism, no difficulty would result from these conditions. But since it is impossible to fix accurately the center of oscillation, it is necessary to determine the mean center and then to work from this point. An example of what has been done in this respect is furnished by Leroy V. Cram, chief engineer of the Empire Automobile Company, who states:

"After carefully determining the approximate mean center of oscillation, our results were checked by laboratory methods and were corrected slightly. Then, because of the tendency of the brake rod to change length we made up our mind that for maximum safety one set of brake levers should extend up from the axle and the other set down. We, therefore, extended our service brake levers down, that being the correct position for 90 per cent of the braking, and the emergency brake levers up, to take care of the exceptional case."

Variation in Braking Power

This does not mean that with this installation the service brake is ineffective when the car is backing up, or that the emergency brake lever does not function when the car is going forward. It simply means that the service brake is more effective in going forward and the emergency in going backward. In either direction it will skid the wheels upon gravel roads, but it takes less pressure with either brake in one direction than it does in the other.

One of the difficulties that engineers have experienced in connection with the Hotchkiss drive, and which up to now has not been entirely eliminated, is wear of the slip spline on the propeller shaft. The amount of slippage at this point normally amounts to about ½ in., but change of propeller shaft length under heavy loads when there is a very severe pressure on the spline causes wear to be noticed at this point at the end of several thousand miles of driving. Probably the remedy is in the use of a type of joint which does away with the necessity for a splined shaft at this point.

New Aircraft Engine Oiling System

AN arrangement of oil pumps for aircraft engines has been patented in England by A. A. Remington of the Wolseley Motor Car Co. which makes it unnecessary to slope the oil base toward the center so that this will always be the lowest point of the base no matter how much the airplane is tilted. Remington provides two return pumps for the oil, one located at each end of the sump and having its inlet in a depression therein. So long as the engine remains substantially level, both pumps will return the oil accumulating in the base of the engine to the oil reservoir, but if the engine is tilted appreciably, so that the inlet of one of the pumps is above the oil level, all of the oil will be returned by the other pump, and for this reason both return pumps are made of sufficient quality to handle the entire oil circulation. The oil feed pump may be located in a pocket of the middle of the sump.

—

THE United States produces 65 per cent of the world's petroleum output. The United States, Russia and Mexico together in normal times produced nearly 90 per cent. The Russian and Mexican oils, however, to a large extent, are not of the class known as "refinable crude petroleum," hence for the production of petrol and naphtha by ordinary refinery methods oil from the United States must be depended upon.

Tractor Development

IT is a matter of congratulation that the tractor industry has made such signal progress within the past year. So far as engineering trend in tractor design is concerned, it is now certain what channels of development will be followed. The more general use of forged, heat-treated gears; the introduction of pressed steel frames; broader use of ball and roller bearings; weight reduction in wheels and gearsets and better engines will make a higher standard of tractor efficiency possible.

The rumors concerning a standardized Liberty Government tractor aroused the tractor makers. Not that they might in any way be opposed to tractor standardization being carried further than it has been carried this year, but the opposition has largely been because any such announcement would tend to delay buying by private purchasers, many farmers deciding to wait until they had seen the new job. The emphatic denial that such a tractor is even being considered by the Government has clarified the tractor sky a good deal.

Good progress has been made with tractor standards in S. A. E. work in the past year, though as compared with what has been done in aviation standards the progress has been very slow. The cases are different. Aviation has but one customer, and that the Government, whereas every one of the 6,000,000 farmers of the country is a possible tractor customer. It is not logical to draw comparisons between the two.

The Fuel Oil Shortage

HARDLY had we passed the critical point in the coal shortage when the country was prepared for another shortage which, if it should materialize, might equally hamper our industries. The first intimation of the impending shortage in fuel oil in the eastern parts of the country was given in an announcement issued last week by M. L. Requa, in charge of the oil division of the Fuel Administration.

As in the case of coal, there is no pronounced shortage at the source, the oil fields of Oklahoma, Texas and Mexico. But the means of transportation have been curtailed, while, on the other hand, the consumption in certain lines has greatly increased. Fuel oil, it may be explained, is a distillation product of crude oil, heavier and less volatile than lamp oil. In recent years much of the fuel oil has been converted into motor oil or gasoline by the cracking process, which, of course, has greatly decreased the available supply of fuel oil. Fuel oil is used very extensively under the boilers of naval vessels, and as a result of the present activities of our fleet, both at home and in European waters, the demand from this field has greatly increased. Further, fuel oil is used for enriching so-called water gas, largely used in industrial processes, as a fuel in stationary steam-power plants and as a fuel for certain classes of internal combustion engines. In the heat treatment of steel, which is now being carried on on an unprecedented scale, owing to the manufacture of munitions in thousands of plants throughout the country, fuel oil is largely employed.

It seems that what led directly to the shortage was the commandeering of a number of tank steamers which plied between Gulf ports and Atlantic Coast refinery districts. There seems little chance of making up for this by increasing railroad haulage of crude oil, as to offset the loss in tanker tonnage would require tens of thousands of tank cars, not to mention the number of locomotives required and the congestion already existing on practically all railroad lines that would come in question. Perhaps, however, when our shipbuilding program gets into full swing and vessels are being turned out according to schedule, the tankers now commandeered will be released and additional ones placed in service between Atlantic and Gulf ports so that there may be no need for shut-downs of industrial or public service plants on account of lack of liquid fuel.

That the situation is serious is shown by an official statement that only five classes of the twelve established under the priority regulations are being supplied at present, and a report from Schenectady last week intimated that the General Electric Co., which is largely engaged on war work, might have to shut down for lack of fuel oil.

Assembly Jobs Must Be Well Balanced

THE practice of assembling from stock parts purchased of outside manufacturers is now so common in the motor truck industry that the quality of motor truck service in general depends to a great extent upon the care with which these components are selected. If a truck is built complete in one plant, every part, naturally, is designed to harmonize with every other part as regards its ability to transmit power or to support loads, and the complete truck generally forms a well-proportioned unit. Starting with the engine as a basis, the clutch is made of just sufficient capacity to transmit the maximum engine power, with perhaps a slight reserve; the change gear is designed to take care of the same amount of power, while in the design of the rear axle account is taken not only of the maximum engine output but of the lowest reduction in the gearbox as well, and the proportions of such parts as the axle shafts will depend also upon the final reduction ratio.

Generally, when an assembled truck is first evolved the various components also are fairly well balanced. Not only is it to the assembler's advantage to use parts of as nearly as possible the same capacity, because it results in a better-performing truck, but the parts manufacturers are interested to have their parts stand up and they will see to it that these parts are not grossly misapplied. Sometimes, however, it is difficult to secure exactly the right parts, especially in times like the present, when the truck industry is booming.

Engine Protected

Probably of all the manufacturers supplying parts for motor trucks, the engine maker is concerned least with a judicious choice of components. If the engine selected is larger than necessary it will simply run light most of the time, which would lengthen its life, though it might lower its fuel economy. On the other hand, if the engine is somewhat small—well, it cannot be made to give more than so much power, and since truck engines have their bearings and other vital parts proportioned for heavy duty, they cannot be injured by being run more or less continually under full load. On the other hand, the clutch, transmission and rear axle all must take the load which the engine is capable of delivering, and if their carrying capacity is below that of the engine, trouble is sure to ensue.

Perhaps no part of a truck is so apt to suffer as the rear axle, if the design is not well balanced. There is no truck axle that has a very high factor of safety, because an axle stronger than need be tends to make the truck heavy and sluggish and to increase tire wear. The best axle is one which has just a small excess of strength over the maximum stress that is likely to even come upon it.

Now there are certain changes which can be made in the design of a truck which will raise this maximum possible stress. They are:

An increase in the engine size; an increase in the low gear reduction ratio; an increase in the rear axle reduction ratio.

It is evident that each of these changes involves an increase in the maximum torque which can be impressed on the axle shafts. No reliance can be placed on the limited coefficient of adhesion causing the wheels to slip, as the use of grips and non-skid chains practically eliminates this safeguard.

Higher Low-Gear Ratios

We understand that some trouble has been caused recently by the introduction of transmissions with extra large low speed reductions. Truck manufacturers have long been calling for such transmissions, but until recently the call had not been heeded by the transmission manufacturers. It is evident that an engine of given torque characteristics can impress 20 per cent more torque on a rear axle if the low gear reduction is five than if it is four, and this may easily be the difference between an axle that will stand up and one that will give trouble.

Heretofore it has been the custom of axle manufacturers to specify the maximum A.L.A.M. horsepower and the maximum weight for which an axle was designed. Low-gear reduction and rear axle ratio have been considered as practically constant for trucks of given capacities, but recent developments have made these assumptions unsafe. It is therefore not unlikely that axle manufacturers will introduce a load figure or capacity figure which will be the quotient obtained by multiplying together the cubic inches engine displacement, the low gear ratio and the rear axle ratio. If this were done and axle makers strictly adhered to the rule of not supplying axles of a given capacity for trucks calling for a higher capacity, axle trouble would be greatly reduced.

Meanwhile it would be well for assemblers to bear in mind that in a well-balanced truck every part is of just sufficient capacity to do its work and no more, and if this balance is disturbed by adopting a larger engine, for instance, the other parts will suffer. There has been a well-defined tendency among assemblers to use engines more powerful than necessary, as it permits of making impressive demonstrations and helps to effect sales. However, to sell the trucks is not the whole problem; unless trucks once sold "stay sold," impressive demonstrations will soon be of little avail, and the first step toward making them "stay sold" is to eliminate weak links and trouble breeders at the outset.

AMONG the many other industries stimulated by the war is that of growing castor beans. Castor oil is generally admitted to be the best lubricant for aircraft engines, but is little used at present because of its scarcity. During the coming spring large areas in several Southern States will be planted to castor beans, at the instigation of the Chief Signal Officer. The price of castor oil has gone up constantly since the outbreak of war, and as long as the war lasts the price will be at least maintained. Even in peace times about a million bushels of the beans are needed in this country annually.

Pennsylvania Buys 40 Tractors

Agriculture Department Will Loan Them to Farmers at Minimum Charge

HARRISBURG, PA., Feb. 27—Secretary of Agriculture Charles E. Patton has completed arrangements to place forty or more farm tractors at the disposal of the Pennsylvania farmers.

No department funds are available for the purchase of tractors, but Secretary Patton had little trouble in securing the pledge of co-operation from the Committee on Public Safety and Defense, which is headed by Governor Brumbaugh and is composed of three other State officials. This commission has had at its disposal for war purposes $2,000,000 and a liberal amount is to be allowed for tractor purchases.

Negotiations are now on with tractor manufacturers for the purchase of forty tractors. Eight or ten different makes of tractors will be purchased and these will be apportioned to different sections of the State. The next task will be to secure eighty or more competent tractor operators, for each machine will be equipped with lights and crew and kept going 20 hr. a day.

Will Train Operators

When the tractors are purchased and the operators secured, one machine of each make selected will be sent to the State Agricultural College and the operators will be sent there for a week or 10 days for instructions from factory representatives and engineers. Eighty first class operators and mechanics are expected to come forth from that school.

Efforts will be made to have organizations of farmers in one county arrange to use the tractors and a regular schedule of work will be made up in each territory. One farmer will contract for 40 acres, another for 50 and enough will be signed to contracts to make it worth while to establish the tractors in that section of country. When all the assignments are made up, a regular tour will be outlined, enough machines will be assigned to the work, and it will be tackled by experienced men. The farmer furnishes the labor.

The farmer will sign a contract specifying how many acres he desires to have plowed and agreeing to pay the charges which will be fixed for plowing and fitting work. The basis for these charges will be fixed by the acre. They will include the cost of fuel, operator and oil, the idea of the State being to furnish the tractor at the very lowest cost to the farmer, with the least amount of trouble and care on his part.

The tractor will carry its own plows, but any other machinery, such as harrows or disks, will have to be supplied by the farmer. It is likely that the charge for plowing will be between $2 and $3 an acre and the charge for fitting the land about 80 cents or $1 an acre.

—

Suspend Aviation Examinations

WASHINGTON, Feb. 28—The War Department has issued an order temporarily suspending examinations at all aviation examining boards, owing to the fact that every aviation school in the country is crowded to the limit.

—

Washington Denies Airplane Contest

WASHINGTON, Feb. 28—The Aircraft Production Board denies newspaper reports of a contest between Liberty airplanes and the Avon airplane at Washington. It states, however, that there will be flying tests at Dayton in the near future between Liberty airplanes and Rolls-Royce airplanes. There will be some Liberty airplanes flying over Washington in the near future, also, but not engaged in any contest.

—

Disagreement Over Fuel Committee

WASHINGTON, Feb. 28—It is apparent that there is considerable disagreement between the Automobile Industries Committee headed by A. W. Copeland and including Hugh Chalmers and John R. Lee and the Fuel Committee headed by W. C. Durant. There are substantial reports current around Washington that these two committees are not working in harmony and that the Fuel Committee appointed five weeks ago to deal with the question of the curtailment of coal to the automobile industry, has not invited the Automobile Industries Committee into its two informal deliberations that have been held. In fact, the Automobile Industries Committee has been entirely ignored so far as this problem is concerned. A formal committee meeting of the Fuel Committee has not been held since the appointment of the committee five weeks ago, although Dr. H. A. Garfield, Fuel Dictator, wanted as early as possible information with regard to the fuel situation in relation to the automobile industry.

It is unfortunate that a committee like the automobile industries committee, appointed to represent the industry in Washington, and in reality representing the industry there, should practically be set aside in this matter. These are days when harmony rather than discord is needed. These are days when co-operation wins more than competition.

One Organization for Ohio Factories

War Industries Commission Plans Pooling of Interests to Stop Inefficient War Buying

CLEVELAND, Feb. 27—A plan to coordinate several thousand factories, including practically every industry in two-thirds of Ohio and part of Pennsylvania, has been proposed by the Ohio War Industries Commission. In brief, the plan would convert all Ohio industries into one huge business with which the government could deal through its representantives in Cleveland. Arrangements would be made so that all inspection, purchasing and payments could be transacted directly through a Cleveland government representative, thus saving the numerous expenses incurred through dealing directly with Washington.

Under the plan proposed, all buying of parts for assemblers and manufacturers doing war work in this district would be done directly in the district. This would save transportation and loss of time. For example, if one company in the Cleveland district were buying small parts in Michigan and sending them to Pennsylvania for machining and then having them returned for assembly, this unnecessary transportation would be eliminated by having all the work done within the Ohio district.

The Ohio War Industries Commission has appointed an executive committee consisting of J. H. Foster, president of the Hydraulic Steel Co., who will have supervision over forgings and castings; E. E. Allyne, president of the Aluminum Castings Co., for aluminum castings; A. W. Henn, secretary-treasurer of the National-Acme Co., for machinery and machine products; J. H. Herron, president of the Cleveland Engineering Society, for engineering. Others include C. A. Otis, president of the Cleveland Chamber of Commerce; E. M. Fairchild, T. S. Grasselli, A. K. Printz and E. E. Teare. Representatives of automotive and rubber industries will be named in the near future.

It is the plan of the commission to divide Ohio into ten districts, each to be controlled by an executive committee with sub-committees further dividing each industry into strict classifications. For example, there are sub-committees in the castings division for gray iron, aluminum, brass, malleable iron, and steel. The Executive Committee will deal directly with a Government body

Automotive Industries

Dayton Gets S. A. E. Summer Session

June 17 and 18 Chosen—Aviation Program to Include Flying Demonstrations

DAYTON, Feb. 26—The annual midsummer meeting of the Society of Automotive Engineers will be held in Dayton, Monday and Tuesday, June 17 and 18, with Wednesday, June 19, set aside specially for those wanting to visit several of the factories engaged in aviation work. One entire forenoon will be given up to aviation demonstrations in connection with flying and other allied activities.

The decision to hold a summer meeting at Dayton came as a recommendation from the meetings committee and was approved by the Council of the Society at its monthly meeting held here yesterday. The great activity of the society in aviation matters and the fact that there are three aviation fields in Dayton were deciding factors in selecting this city for the summer meeting. Headquarters will be at Hotel Miami.

Dayton engineers held a meeting today to decide on forming a Dayton section of the Society. This section will practically take charge of all local arrangements with regard to the summer meeting. Although the city has not adequate hotel accommodations for the 700 or 900 who will attend the session, the Dayton committee will arrange a billeting system which will take care of 1000 or more members and friends.

At yesterday's meeting of the society, B. B. Bachman was appointed chairman of the Standards Committee for 1918, and a large percentage of the committee personnel decided upon. The complete appointments will not be made for some weeks yet. Bachman succeeds J. G. Utz, who filled the position last year and who is now in charge of production of the standardized war trucks. David Beecroft was appointed chairman of the meetings committee and announced as his committee F. E. Moscovics, C. F. Scott, F. E. Place and E. R. Greer.

The finance committee under Chairman H. M. Swetland consists of Christian Girl, Hugh Chalmers, Henry R. Sutphen and George H. Houston. President Kettering also appointed C. C. Hinkley chairman of the membership committee.

President Kettering gave a dinner to the Council and several Dayton friends at the new Dayton Engineers Club which was opened a few weeks ago. The club, the gift of President Kettering and Colonel Deeds, both of Delco fame, to the engineers of Dayton, is one of the most modern clubs and contains a lecture hall that will seat 400.

After the dinner the subject of discussion was the knock in the kerosene engine, the illustrated talk being given by members of the research laboratory, of which President Kettering is head.

The point was established that the knock is not due to pre-ignition but to the composition of the fuel and that detonations and almost major explosions occur after the first ignition and when the piston is well down on the stroke. These knocks are due more to the composition of the molecule than to the degree of volatility. Diagrams were shown illustrating how the knock varied with different fuels.

—

Vincent and Marmon Promoted

DAYTON, Feb. 26—Major Jesse G. Vincent, chief engineer of the airplane department here, has been promoted and is now a Lieutenant-Colonel and Capt. Howard Marmon is now Major Marmon and is assistant to the chief engineer and in charge of McCook Field, the experimental and research center for airplane development of the country.

The building activity around the field is being rapidly pushed and the field put in condition for the opening of spring. Col. Vincent and Major Marmon are in complete charge not only of airplane design but experimental work as well. Major B. D. Gray, in charge of production, is now located here.

—

Morse Vice-President of Curtiss

WASHINGTON, Feb. 27—E. C. Morse, former vice-president of the Chalmers Motor Co., has been elected vice-president of the Curtiss Aeroplane & Motor Corp. He has been at Washington for some time as representative of the John Willys interests, including the Willys-Overland and Curtiss companies.

—

Chandler Stock on 12 Per Cent Basis

CLEVELAND, Feb. 28—The directors of the Chandler Motor Car Co. declared a regular quarterly dividend of 3 per cent, placing the stock on a 12 per cent basis. Heretofore dividends have been paid at the rate of 2 per cent with 1 per cent extra each quarter. J. W. Prentiss, of Hornblower & Weeks, retired as a director, and was succeeded by J. A. Fayne of the same firm.

—

Younger in Army Engineering Section

WASHINGTON, Feb. 28—John Younger, truck engineer of the Pierce-Arrow Motor Car Co., Buffalo, is now serving in the engineering division of the motor transport section of the Quartermaster Corps under Christian Girl.

Chevrolet to Be G. M. Division

Status Will Be Same as Buick and Cadillac—No Change in Production Methods

NEW YORK, Feb. 23—The Chevrolet Motor Co. is soon to pass out of existence as an independent automobile producing company. Under the terms of a recommendation submitted at the annual meeting of the General Motors Corp., and soon to be ratified, it will become a division of the General Motors Co. and its status will be the same as that of other General Motors divisions such as Buick, Cadillac, Oakland, Oldsmobile, and the other large parts-making concerns. Like these companies it will go on producing automobiles as in the past and its methods of distribution will not be altered.

The Chevrolet Motor Co. at present owns a controlling interest in the General Motors Co., but when the new plan becomes effective there will be only General Motors stock outstanding. This will amount to $50,000,000 of 6 per cent preferred stock, representing an increase of $30,000,000, and $150,000,000 common stock, this being an increase of $67,400,000, both increases having been recommended.

Combined Output of 400,000 Cars

When the changes are completed, the General Motors Corp.'s various divisions will have a combined output of close to 400,000 cars a year with cars in every price class except the very lowest, ranging from the smallest Chevrolet at $685 to the Cadillac at $2,800. Chevrolet alone accounts for 125,000 cars of the 400,000.

The Chevrolet company at present owns 54 per cent of the outstanding General Motors stock amounting to 450,000 shares. It is proposed that the General Motors Corp. turn over 282,684 shares of its stock to the Chevrolet company for all its assets except the General Motors stock it now owns. In other words, when the deal is finally put through, the assets of the Chevrolet company will consist of 732,684 shares of General Motors stock. Against this there will be outstanding some 140,048 shares of Chevrolet having a present par value of $64,004,800, which is to say that the Chevrolet Motor Co. will then own one and one-seventh shares of General Motors stock for every one of its own. Under the new plan, Chevrolet will become the owner of 732,684 General Motors shares out of a total outstanding of 1,108,264.

W. C. Durant who fathered and developed the Chevrolet Motor Co., will continue head of the General Motors Co. and

Digitized by Google

chairman of the board of directors, in which there have been some changes. E. I. du Pont de Nemours & Co. have acquired substantial stock holdings in both Chevrolet and General Motors, both of which companies are controlled by the du Pont company and Durant, who is the largest single stockholder. L. G. Kaufman has resigned as a member of the finance committee but remains a director, and the du Pont company now is represented on the Board of Directors by J. A. Haskell, J. J. Rafkob, P. F. du Pont, Irenee du Pont and Henry F. du Pont, the last two being elected directors last Thursday.

The General Motors Corp. was formed Sept. 16, 1908, and at present owns the entire capital stock of the following divisions or manufacturing companies: Buick Motor Co., Cadillac Motor Car Co., General Motors Export Co., General Motors Truck Co., Jackson-Church-Wilcox Co., Oakland Motor Car Co., Olds Motor Works, Northway Motor & Mfg. Co. and Weston-Mott Co. It also owns a majority of stock interest in the Champion Ignition Co., Flint, and operates under lease the McLaughlin Motor Car Co., Oshawa, Ont., and the General Motors, Ltd., London, England.

The Chevrolet Motor Co. was formed Sept. 23, 1915, and owns all of the outstanding capital stock of the Chevrolet Motor Co. of New York, Chevrolet Motor Co. of Michigan, Mason Motor Co. of Flint, Chevrolet Motor Co. of Toledo, Chevrolet Motor Co. of Bay City; it has profit sharing relations with Chevrolet Motor Co. of Canada, Chevrolet Motor Co. of St. Louis, Chevrolet Motor Co. of California, Chevrolet Motor Co. of Texas. In addition to its 450,000 shares of General Motors stock, the company also owns 106,000 shares of common stock of the United Motors Corp. and 13,650 shares of Scripps-Booth common.

Due to the fact that this large block of United Motors stock is owned by Chevrolet, and because the same interests control both General Motors and United Motors, there is talk of having General Motors take over United Motors in the same way it has taken over Chevrolet, to make of it another General Motors division.

—

Dort to Make 20,000 Cars

FLINT, MICH., Feb. 24—The Dort Motor Car Co. and its Canadian associates, Gray-Dort Motors, Ltd. of Chatham, Ont., produced about 8000 cars in 1916. Last year the production increased practically 100 per cent, and this year it is expected that the two plants will turn out 20,000 cars.

—

Will Not Reveal Garabed Tests

WASHINGTON, Feb. 23—The secrets of Garabed, the new and mysterious free energy discovered by W. K. Giragossian, will not be revealed through the official tests approved by Congress. Its inventor claims that he does not wish the secret to fall into German hands and refuses to reveal the names of the five scientists who will make the tests and will not tell the exact place or the date.

Plan International Standards

American Delegates Already in England to Help Formulate System for All Allies

WASHINGTON, Feb. 23—Standardization of manufacturing materials related to production of motor cars, motor trucks, airplanes, tractors and machinery takes a new step with the announcement of arrival in England of delegates from all the allied countries for conference on International Standards.

The American delegation headed by F. G. Diffin, representing the Aircraft Production Board, arrived safely late last week and includes members from all the prominent American engineering societies: The Society of Automotive Engineers, American Society of Mechanical Engineers, American Society for Testing Materials, etc. There are also members from the Aircraft Board, the Advisory Committee on Aeronautics, the Signal Corps, the Navy, and the original International Aircraft Standard Board from which this conference is an outgrowth.

The following is the list of the American members: F. G. Diffin, Chairman; Dr. W. F. Durand, Lieut.-Commander Benjamin Briscoe, Lieut. W. F. Prentice, E. H. Ehrman, Charles M. Manley, James Hartness, Albert L. Colby, Capt. A. B. Tilt, F. G. Ericson, C. F. Clarkson and F. R. Baxter.

Will Influence Future Production

Standardization of parts and materials in America to augment industry was first emphasized through the work of Howard E. Coffin, now chairman of the Aircraft Board, and the late Henry Southern. After the war started, a paper was read by Diffin before the Society of Automotive Engineers on Aircraft Standardization, which led Coffin to place Diffin in active charge of standardization work toward international results.

The present conference is the result of Diffin's work during the past 9 months. This present congress will without doubt have considerable influence on future international manufacturing, enabling better service with less man-hour effort by relieving plants from carrying in stock materials not standardized and by concentrating on materials of known performance.

No attempt will be made by the conference to standardize airplane construction, but rather those materials and units which are at present causing difficulties in purchase and delivery and for which suitable standards can be set.

—

Harroun Assets $11,186,768

WAYNE, MICH., Feb. 26—The Harroun Motors Corp. reports gross assets of $11,186,768.26 for the year ending Dec. 31. These are divided into capital assets, consisting of land and buildings, machinery and equipment, tools, dies, etc., of $1,348,295.13; patents, models and goodwill, $7,006,887.01, and treasury stock, $2,155,930. Current assets including inventory are $277,286.09; cash on hand, $157,068.10, and with accounts, notes and investments total $660,263.45. Prepayments, covering advance insurance, travelers' expenses and advances on ordnance contracts are $15,392.67.

Liabilities include capital stock, $10,000,000; deferred liabilities, $784,462.40, with current liabilities of $395,375.86.

Production of the Harroun Motors Corp. is now up to 30 per day. This production is being maintained in spite of the fact that a large contract calling for several million 155-millimeter shells has been taken by the company. It is probable also that assembly work on the Class AA truck will be undertaken at the Harroun plant, but this will not interfere with the production, which is expected to increase rather than decrease. To date the company has not had to complain of freight car facilities owing to its advantageous location on the outside of the congested belt area. It is reported that an outer belt freight line will also be established at Detroit and if this is done the line will touch Wayne.

—

S. A. E. Tractor Discussion

CHICAGO, Feb. 22—Tractors, in order to be economical on a farm, should be selected in accordance with the number of cultivated acres. The relation of the S.A.E. to the automotive industry and the fundamental differences between the tractor and the motor car were the subjects discussed at last evening's meeting of the Mid-West section of the S.A.E.

David Beecroft, first vice-president of the S.A.E. and directing editor, Class Journal Co., spoke of the enlarged activities of the society and how it had been extended to take in the motor truck, aircraft, tractor, motorcycle, motor boat, and stationary engine industries in addition to the motor car industry. He also spoke of the importance of the tractor with regard to increased food production and of the close relation existing between the society and the government in furthering the latter's war plans.

Dent Parrett of the Parrett Tractor Co. spoke on the fundamental differences existing between the motor car and the tractor from the viewpoint of design and manufacture. He compared the differences between the various principal units, the reasons for these differences and their adaptation to the tractor. A paper on the Economic Size of Tractor was read by Ernest Goldberger, Efficiency Engineer, Packard Motor Car Co.

—

Want Name For Sub-Chasers

WASHINGTON, Feb. 23—The Navy Department has asked the public to suggest a name for the new boats being built by Henry Ford. Two letters are wanted. Assistant Secretary Roosevelt proposed S. D. for submarine destroyers but he thinks a better name can be found. The Ford ships are going to be midway between submarine chasers and destroyers. They will use depth bombs as their principal weapon.

No Anti-Freeze Fluids in France

Alcohol and Glycerine Needed for Explosives—Drivers Must Drain Radiators

PARIS, Feb. 10—No anti-freezing solutions are made use of in the automobile services of the French army. The best non-freezers are alcohol and glycerine, but both of these are required for making explosives, and could only be used in automobile radiators by robbing other and more important services.

It has been found possible to overcome the danger of freezing and consequent cracked jackets and radiators by causing all cooling water to be drained off every evening and during the daytime whenever it is known that trucks will have to stand for a number of hours. A general rule to this effect goes into force each winter and is applicable until repealed at some date in the spring. Drivers are individually held responsible for the observance of this rule; it is no excuse to plead that the evening was mild or that no definite orders had been given for draining off water on that particular evening. So well is this understood that French truck drivers will drain off all water if there has not been a sign of frost for weeks and if the chances of frost during the night are but one in thousands. It is a rule that the radiator plug shall be put inside No. 1 valve cap and the cylinder jacket plug in No. 8 valve cap. New drivers always know where to find the plugs.

A cracked cylinder jacket, owing to neglect to drain water, is punished by prison; a recurrence of this crime may send the culprit into an infantry regiment in the trenches. The rigid observance of this rule entails a certain amount of labor which would be avoided in any private truck service. It has the advantage, however, of reducing cracked cylinders and radiators to near the vanishing point. Before this rule went into force the loss from cracked cylinders was an important item every winter.

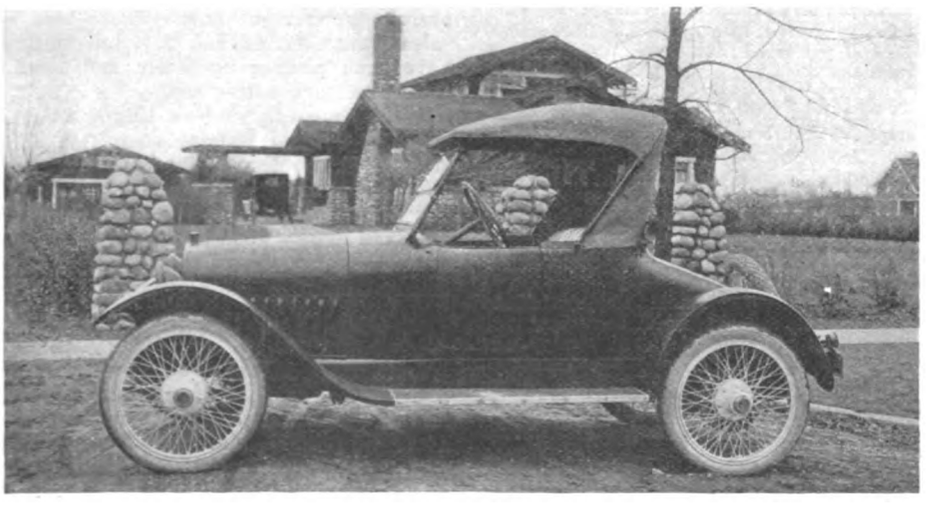
French trucks are not fitted with radiator and hood covers, although many drivers at the front make these covers in their own interests. English trucks are served with these covers. No European trucks are fitted with radiator thermometers, these being found only on a few makes of imported American trucks.

There is no doubt many engines are run too cold, and are inefficient, through lack of a heat indicator. Few drivers consider it necessary to cover the radiator unless it is actually freezing. Experiments with one make of Italian truck built for Alpine conditions, and extensively employed in the French army, showed that with the thermometer at 40 Fah., exactly one-half of the radiator had to be covered to get a good summer average at the outlet from the cylinders. Undoubtedly these trucks were running inefficiently with the whole of their radiator surface exposed.

—

Italy Exports 6678 Cars and Trucks

TURIN, ITALY, Feb. 15—Italy still occupies the position of the leading exporting nation of Europe, according to figures issued by the Ministry of Finance. For the first 8 months of 1917 motor exports totaled $17,736,361, an increase of 96.4 per cent over the corresponding period of 1916, and 113.4 per cent over the first 8 months of 1915.



The greatest proportion of exports were trucks to the Allies, these numbering 6169, at a value of $15,927,835, as compared with 506 touring cars, at a value of $1,619,200. Practically all were fully equipped for allied service.

Imports amounted to only $200,000 for 10 trucks and 183 passenger cars.

—

Harroun Adds Roadster Model

DETROIT, Feb. 23—The Harroun Motors Corp. has added a roadster to its line. It is a two-passenger type, but with a seat wide enough to accommodate three persons if necessary. Its general characteristics are quite similar to the Harroun touring car, and it is mounted on the same chassis. The roadster is illustrated herewith and, as will be noted, has a modified rear deck with tire carrier in the rear. The price of the Harroun roadster is $995, and wire wheels are $100 extra.

1917 Copper Supply Decreases

Smaller Production and Increased Exports Causes of Reduction

DETROIT, Feb. 25—The copper yield of the United States during 1917 had a value of $510,000,000. Arizona produced the most copper, the output being 687,800,000 lb.; Montana, second, with 278,000,000 lb.; Michigan, third, with 275,000,000 lb.; Utah fourth, with 245,000,000 lb. and Nevada fifth, with 110,000,000 lb.

The total production of copper in this country in 1917 was slightly less than 1916, according to preliminary figures and estimates collected by B. S. Butler of the United States Geological Survey. The average price of copper during 1917 was 27 cents per lb., and for 1916 it was 27.2 cents per lb. The average quoted price in 1916 was about 2.5 cents more than that received, while the average for 1917 was probably near the quoted price.

The total production of blister and lake copper from domestic ores was 1,890,000,000 lb. in 1917, as against 1,928,000,000 lb. in 1916. The output of refined copper, including electrolytic, lake, casting and pig from primary sources, domestic and foreign, for 1917 is estimated at 2,362,000,000 lb., as compared with 2,259,000,000 for 1916. The output of refined copper, including electrolytic, lake, casting, and pig from primary sources, domestic and foreign, for 1917 is estimated at 2,362,000,000 lb. as compared with 2,259,000,000 for 1916.

Imports of Unmanufactured Copper

According to the bureau of foreign and domestic commerce, the imports of unmanufactured copper of all forms for the first 10 months of 1917 amounted to 460,780,000 lb., as against 397,594,000 lb. for the first 10 months of 1916. The imports for the year 1916 were 462,335,000 lb.

The exports of pig, ingots, bars, plates, sheets, rods, wire, and lake copper products for the first 10 months of 1917, as determined by the bureau of foreign and domestic commerce, amounted to 953,876,000 lb.; the exports for the first 10 months of 1916 were 655,473,000 lb. Similar exports for the year 1916 were 784,006,000 lb.

At the beginning of 1917 about 128,000,000 lb. of refined copper was in stock in the United States. By adding this quantity to the refinery output of the year, it will be seen that the total available supply of refined copper, exclusive of secondary copper, was about 2,490,000,000 lb. By subtracting from this quantity the exports for the first 10 months and the estimated exports for the last 2 months, and assuming no change in stocks, it will be seen that the supply available for domestic consumption in 1917 was materially less than the 1,430,000,000 lb. available in 1916.

Fisk Profits Double in 1917

Amount to $3,578,484.57 Before Deduction of Taxes—Equal $42 a Share on Common

CHICOPEE FALLS, MASS., Feb. 26—The fifth annual report of the Fisk Rubber Co. shows net profits for 1917 of $3,578,484.57. This almost doubles the $1,836,829.86 earned in 1916. The earnings last year amounted to $16 a share on the $21,525,000 outstanding stock, after all dividends were paid.

The profit and loss and surplus account follows:

Surplus, Balance December 31, 1916		$1,875,442.37
Add:		
Net profits for year ending December 31, 1917, after deducting manufacturing costs, depreciation and interest on borrowed money, but before providing for 1917 Federal income and excess profits taxes		3,578,484.57
Nominal value of 25,500 shares of Federal Rubber Co. common stock, par value $100.00 each, received for sundry services, etc., for which no specific charge was made		1.00
		$5,453,927.94
Deduct:		
Dividends paid:		
First preferred stock	$631,750.00	
Second preferred stock	341,100.00	
	$972,850.00	
Surplus appropriated for retirement of first preferred stock	405,328.81	
Premium paid on 3750 shares first preferred stock retired January 18, 1917	34,819.71	
Provision for insurance liability on stock and equipment at branches assumed by the company	30,000.00	
Payment of taxes applicable to prior periods	5,536.45	
		1,448,534.97
Surplus, balance December 31, 1917		$4,005,392.97

Following is the balance sheet of the company on Dec. 31, 1917:

ASSETS

Capital Assets:		
Land, buildings, machinery etc., at Chicopee Falls and equipment in branches all at depreciated values		$7,040,415.67
Manufacturing rights and leasehold property		106,030.99
Good will		8,000,000.00
Total		$15,146,446.66
Investments		284,622.63
Current Assets:		
Merchandise, raw, process and finished		$17,737,637.58
Tires under mileage contracts		68,561.01
Receivables, less bad debt reserve		6,262,541.01
Collateral notes — employees stock subscription account		462,717.41
Cash		1,658,894.20
Total current assets		$26,190,351.21
Deferred charges		365,348.35
		$41,986,768.85

LIABILITIES

Capital Stock:		
First preferred non-convertible		$4,025,000.00
First preferred convertible		5,000,000.00
Second preferred		4,500,000.00
Common		8,000,000.00
Total capital outstanding		$21,525,000.00
Current Liabilities:		
Loans payable		$11,375,000.00
Accounts payable		3,311,683.01
Accrued wages		24,010.20
Dividends due, not paid		6,706.00
Total		$14,715,399.21
Reserves:		
Balance 1914 reappraisal		$104,577.23
Insurance liability assumed		40,608.26
Guarantee		215,462.37
Total		$360,647.86
Surplus appropriated for retirement of first preferred stock		$1,380,328.81
Surplus		4,005,392.97
		$41,986,768.85

BERNARD M. BARUCH

Who has been appointed head of the War Industries Board, succeeding Daniel Willard, resigned

Fuel Committee Meets

WASHINGTON, Feb. 27—A preliminary, informal meeting of the Fuel Committee, of which W. C. Durant is chairman and which later is to confer with Fuel Administrator Garfield, was held here Tuesday and Wednesday. Among those present were: W. C. Durant, Hugh Chalmers, M. F. Maxwell, Roy Chapin, W. N. Peek, Walter Chrysler, Richard Collins, L. M. Bradley, W. C. Rands, George Graham, John Willys, J. D. Dort and Alfred Reeves.

Baruch Made Head of War Board

Succeeds Willard and Probably Will Have Considerably Broader Powers

WASHINGTON, Feb. 26—Bernard Baruch was to-day named chairman of the War Industries Board, succeeding Daniel Willard, who has resigned. The appointment of Baruch, who on Aug. 25, 1917, was given a place on the War Council Board and made chairman of the Purchasing Board of the Council of National Defense, is taken to mean that President Wilson is practically assured of the passage of the Overman bill. This bill gives the President enlarged powers and would permit him to consolidate buying from scattered departments and bureaus and place it under the control of some central agency. Baruch, in testifying before the Senate Committee, strongly urged a central organization for purchasing. It is expected he will fill, to a great extent, the function of Minister of Munitions but without holding a cabinet seat. The Overman bill would give the President executive power to centralize purchasing power under Baruch's direction.

The whole board probably will be reorganized and enlarged to include representatives of the Shipping, Railroad, Food and Fuel administrations. The new board it is stated will have large authority regarding questions of priority, manufacture and transportation. It is likely that the board will be made independent of the Council of National Defense of which it is now a part.

Boston Show Opens Saturday

BOSTON, Feb. 27—Boston's show, the last big exhibit of the season, opens Saturday. There will be both cars and trucks, and quite a few of the latter, because many of the dealers now have truck agencies and all are looking for a good truck business in New England this year.

The show comes at the beginning of the selling season and is always a good buying show. The prospects seem especially good right now. There was a sales slump during January, but things have been picking up lately and conditions are much better now.

A rally meeting of New England dealers is to be held Monday noon at a luncheon. E. Le Roy Pelletier, nationally known as an advertising man, will tell a story of optimism and why dealers should seek and expect good business. Pelletier has talked at several western meetings during shows.

Briscoe Prices Up $100

JACKSON, MICH., Feb. 27—Prices of the Briscoe 4-passenger touring car, roadster and open delivery truck will be advanced $100 on March 1. The present price is $725 for all three, but after Friday they will be listed at $825.

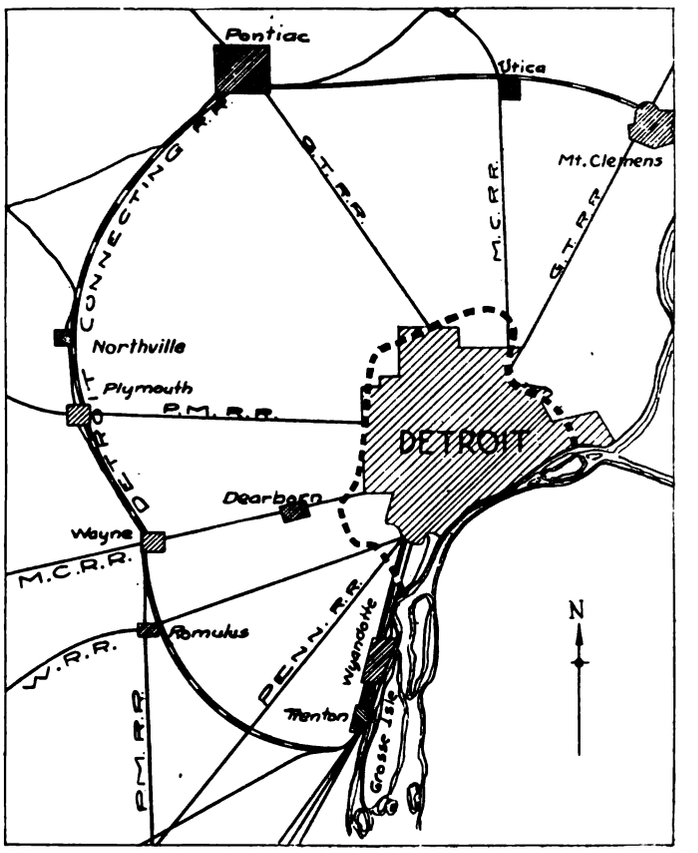
Shipbuilding Plant for Ford

$2,000,000 Plant of Five Buildings Covering 5 Acres to Be Ready in 75 Days

DETROIT, Feb. 25—Henry Ford will erect a new shipbuilding plant at River Rouge to complete the manufacture of submarine destroyers. Construction work on the buildings has already been started, and it is expected that the plant will be completed in 75 days. There will be five buildings, covering an area of 5 acres, and costing, including equipment, approximately $2,000,000. The plant will comprise a fabricated shop, 150 x 450 ft., where parts for hulls will be made; three assembling plants, 100 x 1700 ft., and a fit-up shop, 100 x 1500 ft. The buildings alone will represent an outlay of $1,000,000. The power plants and other machinery will be manufactured at the Highland Park plant of the Ford Motor Co.

Chain System Employed



The material for the chasers will enter the fabricated plant from which the hulls will come out on tracks to each bay of the assembling stations. The hulls then move along, parts being constantly added until they are ready for the transfer table, from which the hulls drop into the water on a hydraulic lift. After the boats are floated the installation of motor parts, boilers and armament begins, the last addition being a wireless. The boat is then ready for the submarine zone.

When the plant is complete and in operation, it will give employment to from 10,000 to 15,000 men. A canal, or slip, from the Rouge River to the plant is now being dredged.

—

Ford & Son Make 75 Tractors Daily

DETROIT, Feb. 27—Henry Ford & Son are now building 75 tractors a day, and will double production within 30 days. The order for 1000 tractors to be sent to the Canadian government will be completed by April. The company has an option on making an additional thousand for Canada.

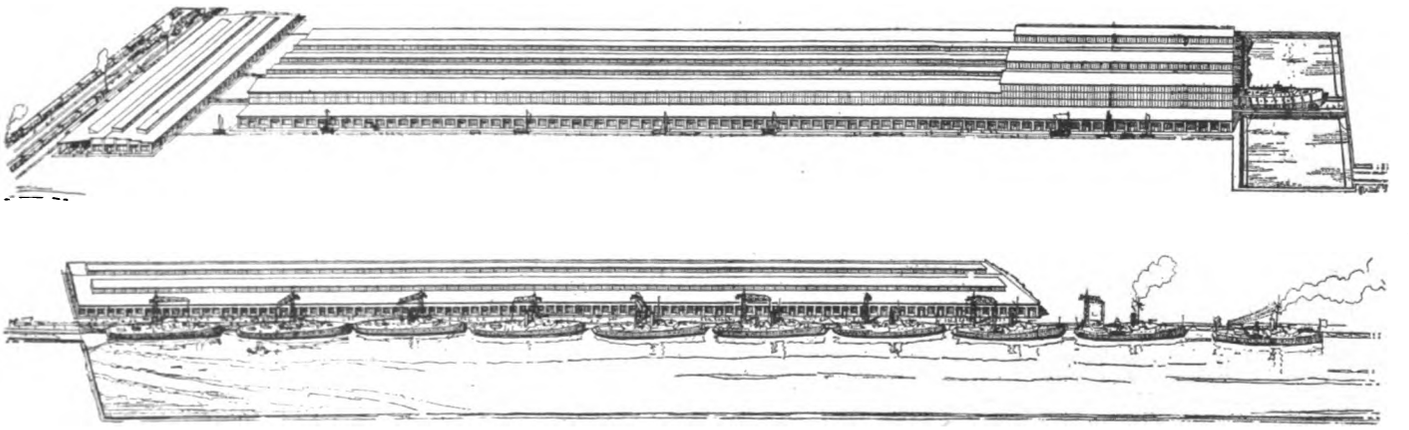
It is planned to build an inner belt line for railroads entering Detroit so that loading and unloading may be facilitated. The dotted line shows the route of the proposed new belt

One Organization for Ohio

(*Continued from page* 470)

to be appointed in Cleveland and which is to be headed by Samuel Scovil, who has been named by the Ordnance Department to represent it in the Cleveland district.

The commission hopes by this pooling arrangement to make war buying less wasteful and more efficient.



Blue prints and specifications of all manufacturing plants will be filed in the offices of the Ohio War Industries Commission for consultation by government officials. Every industry in Cleveland and Akron is a member of the commission, including such companies as Winton Motor Car Co., Chandler Motor Car Co., White Co., Standard Parts Co., Willard Storage Battery Co., Grant Motor Car Co., Peerless Motor & Truck Corp., Miller Rubber Co., Goodyear, Goodrich, Firestone and others.

Plan Outer Belt Road for Detroit

DETROIT, Feb. 27—The Detroit Connecting Railroad has been organized here with $500,000 capital to operate an outer belt line around this city. The proposed road will terminate at Mt. Clemens, on the north, and Trenton on the south, and will pass through Utica, Pontia, Northville, Plymouth, Wayne and Romulus. A belt line of this sort, it is thought, will relieve freight congestion and permit earlier deliveries.

Manufacturers often have to wait 4 to 6 days before freight cars which arrive at a point near the city can reach the unloading station. The outer belt line, by taking care of the needs of the small towns nearby, and increasing the track facilities, will leave the inner belt free for local needs.

It is expected that the road will be ready for operation within the next 12 months.

Ford's new submarine chaser plant will cost approximately $2,000,000 and when finished will cover 5 acres. This is an architect's drawing

175,000 Mechanics in Training

Will Be Ready for Service by October—Estimate Based on Reports of 143 Schools

WASHINGTON, Feb. 22—One hundred and seventy-five thousand newly trained mechanics and technical men will be ready to answer roll call by Oct. 1 for occupations required by the United States Army.

This estimate is the result of questionnaires mailed and personal visits to 143 colleges, trade schools and allied institutions throughout the country, which work was performed by the Federal Board for Vocational Education. Forty-two institutions have signified their willingness to begn work at once and 17 stated they will be able to give instruction by May 1.

The plan is to take drafted men of the First Class who have signified their willingness and give them intensive training. The program of the Federal Board which was created prior to the war to enlarge educational facilities for students of mechanics, industry and agriculture calls for the complete diversion of the available institutions of the country to war vocational training, the board acting for the newly created war education committee of the War Department which was recently formed, as told in a past issue.

The schools are expected to train men with various assets of knowledge and experience to do the work demanded in various army occupations in courses of two months' duration. It is not expected at the outset that novices can be made into experts in this length of time.

The Federal Board now has a number of representatives traveling through the country investigating both public and private schools, including those taking in all automotive trades and industries. These representatives analyze a school and if found satisfactory they place it on an approved list to come before the notice of the War Education Committee.

A course of instruction is expected to accomplish one of the following four results with the individual:

1. Make a semi-skilled mechanic such as a drill-press hand or a second-class lathe operator from a novice.
2. A good technician, as for instance a chauffeur from a novice.
3. An expert in some special line of work from a skilled or semi-skilled journeyman, as for instance a wood specialist on airplanes from a cabinet maker, or an ignition repairman from a garage mechanic.
4. A fairly skilled mechanic from a semi-skilled worker, as for instance a fairly good blacksmith from a blacksmith's helper. The schools are being asked to train men in the following and other lines: Airplane mechanicians, auto repairmen, chauffeurs, draftsmen, gas engine repairmen, ignition repairmen, motorcycle repairmen, sheet metal workers, wood workers, and welders.

A tentative schedule has been arranged for 70,000 mechanics as follows:

Begin training with	10,000 men	March	15
Increase to	20,000 men	April	1
Discharge	20,000 men	May	30
Take on	25,000 men	June	1
Discharge	25,000 men	July	30
Take on	25,000 men	August	1
Discharge	25,000 men	Sept.	30

It is planned to divide these men into eighty squadrons of 125 men to a squadron and each squadron of future soldiers will be taught 21 trades in all.

—

Denby Building Assembling Plant

DETROIT, Feb. 26—The Denby Motor Truck Co. is erecting an assembling plant. The building is a story high, and of brick and steel reinforced concrete construction.

—

Plan Alterations in Factory

DETROIT, Feb. 26—Contracts have been awarded for extensive alterations in the factory of the Detroit Copper & Brass Rolling Mills factory.

—

Studebaker Addition for Shell Work

DETROIT, Feb. 26—The Studebaker Corp. is planning a brick and steel addition to its factory. This, it is understood, will be used chiefly for shell work, which is to occupy 50 per cent of the attention of the company. The contract for the addition has already been awarded.

—

Government Purchases Saxon Branch

DETROIT, Feb. 25—The Michigan Avenue branch of the Saxon Motor Car Corp. has been taken over by the government for munition storage. The transaction was made through the Industrial Terminal Corp., a bonding company, and records filed Monday in the office of the Registrar of Deeds show that the consideration was $800,000. This plant is the new building which was erected by the Saxon company to house its entire business. It has been used in part for storage purposes by the Saxon company, but has not been completed to a sufficient extent for manufacturing purposes.

The deed of transfer was signed by Benjamin Godfredson, president of the Saxon company, and C. A. Pfeffer, secretary. Besides the building, a large piece of land lying between two adjacent roads was involved in the transfer.

—

U. S. Rubber May Resume Dividends

BOSTON, Feb. 26—There have been intimations that the United States Rubber Co. might resume payments of dividends this year on the $36,000,000 common stock. None have been paid since June, 1915, although the company has earned well over 6 per cent each year. In the 2½-year period the company has held back 15 per cent in common dividends, a sum equal to $5,400,000, all of which has been used to strengthen working capital, retire bonds or make plant improvements.

Resume Driveaways in Michigan

Condition of Roads Greatly Improved—May Use Lake Boats for Shipments

CHICAGO, Feb. 25—Driveaways from Michigan factories to Chicago and points west have begun with the partial clearing of the roads by road crews and the recent short thaw. The local Dodge distributer received word from the factory that the road was open between Chicago and Detroit, and a crew of ten men is leaving the factory to-day, and five more leave to-morrow.

Twelve cars from the Reo factory at Lansing are reported to have reached Michigan City en route to Chicago. One hundred cars for the Buick branch at Chicago will leave Flint to-morrow night so that the driveaways are on in earnest, although no cars have come through as yet. There is a possibility that conditions in some parts will be so bad that the crews may be held up a few days.

The train of Reos is particularly well equipped to buck the snow, being preceded by a car equipped with a rotary snow plow. The local Reo distributer expects to receive eight or ten cars a day throughout the season.

In order to determine the road conditions for the Buick fleet, the entire road is to be covered before to-morrow night by cars from Flint, Benton Harbor, Michigan City and Chicago, each traversing a certain section of the road. These cars will have a crew of five men equipped with shovels, etc., to clear away the drifts at the worst spots, and have the roads ready for the fleet of 100 cars which starts from the factory to-morrow. The Chicago Buick distributers have arranged for a schedule of from 100 to 150 cars a day over the roads, and it may be that before the season is over the high-water mark of 185 Buicks a day, which was reached last summer, will be duplicated.

The possibilities of using the lake boats for shipments to Chicago from Michigan factories is being investigated seriously, and, if possible, cars will be driven from a number of factories to ports on the east side of the lake and shipped by boat to Chicago. Scarcity of bottoms, however, may prevent this being done to any great extent.

Studebaker is arranging to ship by boat from Grand Haven, and Maxwells may be shipped by boat if bottoms can be obtained. Harry Newman, the local Maxwell distributer, is endeavoring to charter his own ships, which, if obtained, will carry raw material on the eastern trip and Maxwells on return, thus saving railroad capacity both ways. At the present time Maxwells have been arriving in the Chicago district by railroad, in sufficient quantities, and it is expected that this month will prove one of the biggest in the year.

The circus cars and other flat cars of the Oakland Co., some of which are

Digitized by Google

owned and some leased, have made it unnecessary for local Oakland distributers to worry about driveaways.

Utilizing Chicago as a shipping platform for Michigan car manufacturing centers is an innovation which was put into force by the Reo Co. The factory maintains a crew of eight men at the Chicago branch to load the cars received by driveaway on freight cars for shipment west. Reo also has been using 25 leased horse and express cars for railroad shipment.

—

Hayes Wheel Adds $315,685 to Surplus

JACKSON, MICH., Feb. 25—Profits of the Hayes Wheel Co. for the year ending Dec. 31, 1917, amounted to $787,351. Sales aggregated $8,674,370 and manufacturing costs were $7,907,018. After making discounts on purchases, deducting $37,327 for interest, setting aside $270,000 for federal income and excess profits taxes, and $165,000 for dividends, a balance of $315,685 was carried to surplus, increasing the accumulated surplus to $754,083. This, after various adjustments, including writing off of $76,652 on patent rights and good will, and appropriating $38,411 to cover the unamortized part of discount on the company's 5 per cent gold notes, is reduced to $641,340.

The balance sheet on Dec. 31 follows:

Total assets	$3,936,242.17
Listed inventories, at or below cost	1,400,129.99
Accounts receivable, less reserves	773,637.88
Cash surrender value of life insurance policies	12,616.30
Installment paid on liberty bond subscription	60,400.00
Cash on hand	393,953.30
Investment in properties and plant	1,258,401.12
Investment in other companies.. (Hayes Motor Truck Wheel, $25,000; Jackson Co-operative Realty Co., $1,000.)	26,000.00
Current liabilities:	
Notes payable	$557,481.18
Accounts payable	475,477.47
Accrued taxes	42,624.58
Accrued royalties and commissions	35,323.95
Reserve for federal income and excess profits taxes	270,000.00
Capital liabilities	1,500,000.00
Outstanding authorized capital stock	2,000,000.00

It is reported that plans are under way to apply for listing the company's stock on the Detroit Stock Exchange.

—

Ban Extra Pay for Aviators

WASHINGTON, Feb. 22—Following the recent request of Secretary of War Newton D. Baker, Secretary of the Navy Josephus Daniels has recommended to Congress that extra pay and allowances for members of the Navy Flying Corps be abolished. Secretary Daniels advances the argument that the granting of such extra pay is no longer necessary since flying has progressed to such an extent that it is no longer an extra hazard in time of war, and he states the granting of such extra pay is unfair and unjust to other officers and enlisted men operating in service more hazardous.

Export-Import Rule Not Harmful

Manufacturers Do Not Believe Industry Will Be Affected by Proclamation

DETROIT, Feb. 25—Manufacturers in Detroit and throughout this territory do not believe that the President's ruling regarding the licensing of exports and imports will seriously affect the automobile industry. Certain phases of the ruling, however, might have an adverse effect if they are to be construed too literally by the government. Looking at the matter from a general standpoint, manufacturers believe that the internal freight situation and the difficulty of shipping to tidewater points have put a far greater damper on export business than the regulations incorporated in the President's proclamation.

With a reduced production due to war work, manufacturers in the automobile industry are nearly all behind in production. It is therefore quite natural that domestic demand will be taken care of before foreign demand, so that this factor alone would necessarily reduce exports.

The Ford Motor Co. is a good example of this. In all probabilities this concern will cut off immediately all export shipments. This, however, would have been done regardless of President Wilson's order, in view of the fact that production has already been cut 50 per cent, and also that the company has stopped shipments to congested freight districts, such as New York and Philadelphia. As a move in the direction of the conservation of shipping space, manufacturers cannot help but approve of the action, and concerns which export, even in large consignments, do not believe that their business will be seriously affected. Dodge Brothers do not fear any adverse results for several months to come, if at all.

Naturally great numbers of passenger cars will be shipped for military purposes, and large producers are making earnest efforts to get a share of this business. Dodge Brothers are shipping a number of their cars for use as officers' cars, and are heartily in sympathy with President Wilson's proclamation.

Some of the concerns say that European business has been quiet for some time, with the exception of Spain, and since the embargo on gasoline and oil to the latter country, which made the price of gasoline approximately $1 a gallon in that kingdom, business has been decreasing there also. For that reason shipments to Europe will not be seriously affected. It is not likely that the government will curtail export business in South America any more than is absolutely necessary, in view of our efforts toward commercial supremacy in that part of the world after the war.

Manufacturers look for a modification of that part of the order in which the weights of certain metals comprising the articles to be shipped must be mentioned. This would be a manifest hardship in certain cases, as it would take a metallurgist a long time in a great many instances to list the weights of different kinds of metals used in certain parts.

—

Northwest Tractor Men Organize

MINNEAPOLIS, Feb. 23—The Northwest Tractor Trade Association was formed with 36 charter members at a meeting in the Hotel Radisson, attended by 80 persons. Dues were put at $50 a year payable semi-annually and the organization started after adoption of by-laws with a list of officers as follows: President, D. J. Murphy; vice-presidents, N. B. Nelson and J. M. Orton; secretary, W. B. Gleeson and treasurer, P. J Perry; directors, H. W. Brown, H. D. Dodge, P. J. Keating, W. R. Stephens, E. K. Jenkins.

The purpose of the organization is to bring the manufacturers and distributers of tractors and power machinery into co-operation for furthering of the industry. Eligible for membership are all manufacturers of gas, oil and steam tractors and plows and accessories, distributers and factory branch managers. The only paid official will be an assistant secretary.

—

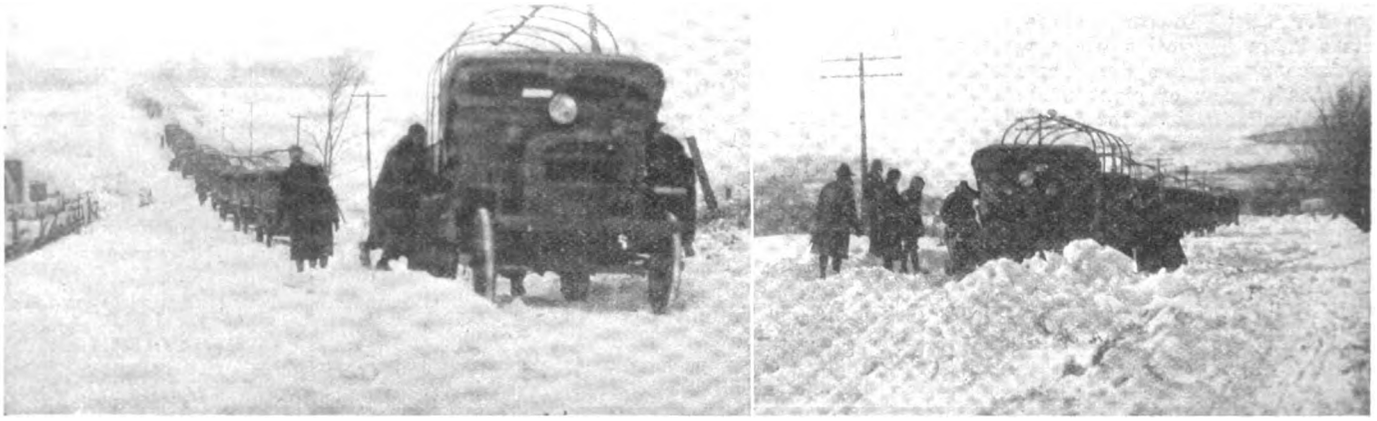
Freight Embargoes Limit National Profits

INDIANAPOLIS, Feb. 25—The operations of the National Motor Car & Vehicle Corp. under reduced production from July, 1917, until December, 1917, showed a much better margin of profit than formerly, until freight embargoes in December limited the company's shipments to a point below opportunity for any profit during the month. The balance sheet, on Dec. 31, 1917, follows:

Assets

Property and equipment, less depreciation	$827,689
Cars, stores, works in process and supplies	1,353,750
Accounts receivable and drafts on customers less drafts secured by cars shipped	198,895
Cash in banks and on hand	21,879
Insurance, advertising and organization expenses	67,208
	$2,469,422

Liabilities



Accrued taxes on car sales	$12,579
Accrued payrolls	7,513
Federal, state and county taxes	31,000
Reserve for guarantee on car repair	15,000
Notes payable—banks	605,000
Notes payable—creditors	117,991
Accounts payable	224,042
Deposits by dealers	44,281
Capital and surplus	1,412,212
	$2,469,422

"The problem of keeping the roads clear so that motor trucks may be utilized to the fullest possible extent in relieving the railroads is one that calls for more than isolated, emergency effort. It must be dealt with comprehensively and preparation made in advance to keep roads open at all times."—Roy D. Chapin, Highways Transport Committee

Columbia Motors to Make 500 Government Trailers

DETROIT, Feb. 23—The Columbia Motors Co. has obtained a government contract to make 500 two-wheel 1-ton trailers. It is expected to have half of the order ready for delivery early in March and the complete order on the way by April.

The factory is preparing plans to readjust its forces so as to permit the building of the trailers without undue interference with the manufacture of passenger cars.

The government has asked the company to arrange its factory forces and equipment so as to enable it to take care of subsequent orders. The officials state that their plans are so arranged that they can fill all orders for the government as fast as the latter requires them, and at the same time continue their previously arranged program of building passenger cars.

Simultaneously with the receipt of this order the Dort Motor Car Co. was asked to build 1500 trailers, the Ohio Trailer 1000 and the Miami Trailer and Rogers Trailer each 500. This makes an aggregate order of 3500 trailers.

—

Commerce Truck Gets Government Contract

WASHINGTON, Feb. 24—The Commerce Motor Truck Co., Detroit, has received a contract for 1500 1-ton Commerce trucks for the Ordnance Department.

—

Fords Now $595 in Canada

TORONTO, ONT., Feb. 27—The price of Ford cars in Canada has been increased $100, making the new price $595.

—

Studebaker in Production on New Models

DETROIT, Feb. 27—The Studebaker Corp. expects to be working full speed by the end of March, before which time it will have manufactured 1000 cars. The three cars which the company has been trying out on the Chicago Speedway for several weeks past have completed their tests, and have traveled 30,000 miles. The tests were made to secure information for the engineering department. Two of the cars used were 6-cylinder touring models, and the third a 4-cylinder.

—

Goodrich and Kelly-Springfield to Reduce Capital

NEW YORK, Feb. 27—Two tire manufacturing companies will reduce their capital stock in March. The B. F. Goodrich Co. stockholders, at a special meeting to be held here on March 13, will vote to authorize the reduction of the preferred stock from 264,000 shares, par value $100, to 255,000 shares. This will bring the total capitalization from $86,400,000 down to $85,500,000. The stockholders of the Kelly-Springfield Tire Co. at their meeting in Jersey City, March 12, will ratify the resolution adopted by the Board of Directors to reduce the capital stock $248,900 by the withdrawal of 24,800 shares of 6 per cent cumulative first preferred stock.

—

Preferential Coal Distribution Outlined

WASHINGTON, Feb. 26—Fuel Administrator Garfield has outlined a series of classes for preferential coal distribution. Class I includes domestic consumers, Class II necessary war industries, Class III necessary peace industries, and Class IV makers of so-called luxuries. The preferential distribution will be enforced by orders to coal operators and railroad embargoes.

—

Leverton Federal Factory Manager

DETROIT, Feb. 27—A. C. Leverton has been appointed factory manager of the Federal Motor Truck Co. He was formerly general superintendent of the Chalmers Motor Co.

—

Standard Parts to Move

CLEVELAND, Feb. 27—The Standard Parts Co. is to have a new home. It has leased the fourth, fifth and sixth floors of a six-story building to be erected here and to be called the Standard Parts Bldg.

Announces Manufacturers Doing Government Work

WASHINGTON, Feb. 23—Following the action of the Secretary of War, Newton D. Baker, in allowing publicity for military contracts, H. L. Horning, Chairman Automotive Products Section, Council of National Defense, has made public the following lists of companies which are working on Government truck motorcycle and passenger car requirements. This list represents only contracts which have come through Horning's office for approval. No publicity is given to tractor contracts which includes tanks, or to amounts and sizes of contracts.

This map shows the locations of the Return Loads Bureaus and the routes which have been laid out throughout the State of Connecticut

Connecticut Eliminates Dead Truck Mileage

Information as to Routes Necessary for Deliveries Obtained from Shippers by Return Loads Bureaus

NEW YORK, Feb. 25—The State of Connecticut, as told in AUTOMOTIVE INDUSTRIES last week, has 14 Return Loads Bureaus in as many cities and about 700 trucks of 1-ton capacity are operating in conjunction with the bureaus. The whole Return Loads Bureau idea is an advertising one whereby the shipper who has goods to move may get in touch with a motor truck operator able to move them. As such the bureaus have advertised extensively and have posted in conspicuous places in the various cities posters telling of the existence of the bureau and how it can serve both manufacturer and transportation company.

One of the greatest troubles experienced by the Council of National Defense in getting the idea started was the indifference on the part of shippers generally and the idea that their responsibility ended as soon as the goods were packed and dumped on the railroad platform. The old-style traffic managers of the industrial plants were loath to change their shipping methods from railroads to motor trucks. At first they claimed there were no trucks available.

When it was proved to them that there were 700 trucks of 1-ton capacity and over in the state available for the work, they claimed that the roads would be impassable. But here again Connecticut solved the situation by its efficient snow-removal plan.

While the principal work of the Return Loads Bureau was in connection with motor truck traffic over the roads, it also was the means whereby the trolley freight concerns more than doubled their tonnage and also increased the service rendered by the boat lines running between Connecticut points and New York.

One boat line between these two points was to be shut down during the winter until the committee offered to guarantee the boat company a profit on the run. Even then it was skeptical, but finally consented to run the line with the result that it received so much freight that an embargo had to be set down on the line in less than a week's time.

The first step in the formation of a Return Loads Bureau to cover a state or any particular territory in that state is to find out the number of trucks in the state or territory under consideration.

This done, it is necessary for the main or central bureau to then send out return postal cards requesting information as to the trucks in each particular case; whether or not the trucks are available for overland haulage; the sizes of the trucks; what they can best carry, and the routes they usually run over and how often.

The information obtained from these postals may be entered on index cards. The trucks available for work on any particular route are filed behind a blank card having a marker designating the number of that particular route.

This master file should be duplicated and furnished to each of the local Return Loads Bureaus formed in each of the important cities, together with a map showing the location of each bureau and all of the numbered routes.

By this means the head of the bureau in each city knows exactly what trucks are available for any of the other forty-eight routes. For instance, the bureau in New Haven knows what trucks are available for haulage work between Danbury and Bridgeport or between Hartford, South Manchester or Norwich.

As soon as this information has been obtained each of the bureaus should circulate the information that such data are available by means of letters to all of the large shippers and manufacturing plants in its own locality. Each bureau should also request that each shipper or

Digitized by Google

manufacturer give the bureau information concerning its overland haulage needs so that this data may be included on cards similar to those on which the trucks data is kept and inserted in the front part of the filing cabinet in each bureau.

Thus, when a shipper calls up any bureau and asks for the names of available truck owners to haul goods between any two cities, the method is simply to determine the number of the route and then give the shipper the names of the truck owners operating vehicles over that route. Reversely, the names of shippers or manufacturers in any particular city may be had by scanning the cards in the front of the file.

Telephone Numbers Listed

To make it easier for either shipper or truck operator to get in touch with the bureau, the Connecticut organization has arranged to have the regular telephone number of the chamber of commerce listed a second time in the book under the heading "Return Loads." This makes it very convenient for a strange truckman to reach any particular bureau and find out the names of concerns which might have a return load to be hauled to its home city.

—

Another Truck Train Arrives

WASHINGTON, Feb. 24—The first truck train of several which left Detroit within the last 10 days arrived at Baltimore to-day with its full quota of 30 trucks. The trip was made in 8 days, the average distance being 72 miles per day for the 575-mile journey. The highest day's mileage was 97.4 miles over smooth straight roads and 85.4 miles through the mountains. The second truck company reached Bedford, Pa., last night.

Ford Car Price Increase of $90—Chassis $75 More

Klingensmith Ascribes Raise to Greater Cost of Material

DETROIT, Feb. 25—The Ford Motor Co. has increased the price of its cars $90 and its chassis $75. The price of the truck chassis remains unchanged. The increase is not altogether surprising to dealers who for some time have been urging early purchases in view of a possible increase. Only last week, however, Frank Klingensmith, treasurer of the Ford company, stated positively that no increase was in contemplation.

Klingensmith ascribed the increase to the rising cost of materials. It is likely that the reduced output of the Ford company also has had an important bearing, the present production being but 1500 cars a day as against 3000 a short time ago. With the output thus reduced 50 per cent, it is but natural that materials cannot be purchased in such large quantities as with a normal output.

FORD PRICES

Model	Old Price	New Price	Increase
Touring	$360	$450	$90
Roadster	345	435	90
Chassis	325	400	75
Truck chassis	600	600	..

O'Donnell Heads Oil Production

WASHINGTON, Feb. 22—T. A. O'Donnell, Los Angeles, Cal., has been appointed in charge of oil production for the oil division of the United States Fuel Administration.

—

Guilford Truck in Greensboro

GREENSBORO, N. C., Feb. 26—The Guilford Motor Truck Co., recently organized with $250,000 capital, and established at Martinsburg, W. Va., will move here as soon as a factory can be leased. The company will manufacture a 1-ton truck to sell for $1,075, with a 130-in. wheelbase, worm drive, electric lights and starter. Materials sufficient for the manufacture of 2000 trucks, with the exception of engines and rear axles, have already been purchased and will be transferred from Martinsburg.

—

Maccar Truck Prices Increased

SCRANTON, PA., Feb. 26—List prices of Maccar trucks have been advanced as follows:

Model	Capacity	New Price	Old Price
L	1½-ton	$2,550	$2,450
H	2½-ton	3,100	2,950
M	3½-ton	3,850	3,600
U	5½-ton	4,750	4,500

—

Mid-West Mfg. Starts Production

HASTINGS, MINN., Feb. 26—The Mid-West Mfg. Co., organized here recently with a capital of $50,000, has started operations. The company will manufacture airplane parts and commercial bodies.

—

Sweden Plans Airplane Mail Service

WASHINGTON, Feb. 25—Sweden is considering proposals for the establishment of airplane postal service between Stockholm and Abo and Stockholm and Petrograd. The service between Stockholm and Petrograd would reduce the time of postal transit from 5 days to 25 hours, and from Stockholm to Abo from 4 days to 6 hours.

—

Savannah Dealers Organize

SAVANNAH, Feb. 26—Savannah dealers have organized the Savannah Automobile Dealers' Assn., with C. E. Vinson, head of the C. E. Vinson Motor Co., as president. L. H. Dimmitt was elected secretary and treasurer.

Men of the Industry

Changes in Personnel and Position

Templar Motors Corp. Adds to Organization

CLEVELAND, Feb. 26—The Templar Motors Corp. has made several additions to its organization. Charles E. Taylor, who has been connected with Peerless, Chandler and Hal companies, is now in charge of factory production. Thomas McKay, who served 12 years as master mechanic of the Whitney Mfg. Co., has been appointed to a similar position with the Templar organization, and James Farr, who has had 7 years of training in ordnance work in England, is the new superintendent of munitions production.

—

Clinton B. Amorous, who has been connected with the sales department of the Locomobile Co. of America for several years, and formerly held the position of assistant purchasing agent, has been commissioned a major in the Signal Corps. At present he is stationed at Washington.

W. F. Schmitt, for many years connected with the Packard-Missouri Motor Co., St. Louis, has been elected vice-president of the organization.

W. B. Cockran has been appointed western sales manager of the United States Motor Truck Co., Cincinnati. He will have headquarters in San Francisco.

T. P. Chase, for several years chief engineer of the King Motor Car Co., Detroit, has resigned.

J. B. Siegfried has been appointed general manager of the King Motor Car Co., Detroit. He has been an executive of the company for several years, first as production manager and later as assistant general manager.

William Burgess Nesbitt, who for 5 years has been advertising manager of the King Motor Car Co., Detroit, has been elected vice-president of the company, to succeed T. E. A. Barthel. His headquarters will be at 50 Union Square, New York.

A. C. Webb has been appointed district sales representative of the Fulton Motor Truck Co. with headquarters in Atlanta. He will have charge of sales in 7 states.

Louis Schwitzer has been elected president of the Automotive Parts Co., Indianapolis, manufacturer of cooling fans and other accessories. He was formerly vice-president and chief engineer of the Oakes Co., Indianapolis.

Lloyd A. Bachman, formerly purchasing agent for the J. C. Wilson Truck Co., is now connected with the Commonwealth Brass Corp., formerly the Lavigne Mfg. Co., Detroit. He will have charge of publicity and research work.

F. M. Holden, formerly in the airplane engineering department of the Signal Corps at Washington, is now research engineer of the Cadillac Motor Car Co., Detroit.

Harold G. Wilson, for 7 years sales engineer of the automobile division of the Hyatt Roller Bearing Co., Detroit, who left that position to join Holley Brothers, has returned to the Hyatt company to represent the tractor division in Detroit territory.

Owen Moynihan has been appointed general sales manager of the Amazon Rubber Co., Akron. He was formerly manager of the New York branch.

C. E. MacConnell has joined the sales engineers staff of the Hyatt Roller Bearing Co. MacConnell was formerly advertising manager of the Detroit branch of the Goodrich Rubber Co.

K. C. Miller, after 6 years' service in the ordnance department of the Root & Vandervort Co., Rock Island, Ill., has resigned to become chief engineer of the Wright-Martin Aircraft Co., New Brunswick, N. Y.

A. J. Jackson, for several years sales manager for the Kissel-Kar in Davenport, Iowa, has resigned to become sales manager for the Day-Elders Motor Corp., New York, and will have charge of Iowa and western Illinois territory. He was formerly with the Pierce-Arrow company.

A. R. Miller, former vice-president of the Wolverine Automobile Club, and sales representative of the Troy Wagon Works Co., Detroit, has been appointed district sales manager for the same company. He will have headquarters at Philadelphia.

J. A. Holihan has been appointed general sales manager of the Standard Motor Truck Co. He was formerly assistant general manager of the Briscoe Mfg. Co., and later president and general manager of the Holihan Mfg. Co. For the last 2 years he has been district sales manager for the Federal Motor Truck Co.

William D. Paine, for the last 10 months eastern sales manager for the Saxon Motor Car Corp., stationed at York, Pa., has been commissioned a captain in the Ordnance Reserve Corps.

W. H. Thompson, for many years with the Westinghouse Electric & Mfg. Co., has resigned. He will become works manager of the Fairmont Mining Machinery Co., Fairmont, W. Va.

R. F. Jackson, formerly assistant sales manager of the Zenith Carbureter Co., has been appointed sales engineer, succeeding P. E. Miquelon, who has been placed in charge of the Chicago branch.

—

Aeronautic School for Pittsburgh

WASHINGTON, Feb. 25—An aeronautic school to be styled Langley Laboratory of Aeronautics will be erected shortly at the Carnegie Institute of Technology at Pittsburgh. It is expected that the airplane building will be ready in 30 days.

New Companies Formed

Latest additions to ranks of Automotive Industries

Wohlrab Company Starts Production of Truck Gears

RACINE, WIS., Feb. 25—The Wohlrab Gear Co., recently incorporated here, is just starting production of a split-nut steering gear for motor trucks. This is designed to operate with oil instead of grease, due to special construction of the housing and exterior arrangement. The company has $75,000 capital and is organized under the laws of Wisconsin. T. B. Wohlrab is president, E. M. Caskey vice-president, E. J. Smieding secretary, and J. G. Kluyskens export sales manager.

—

STANLEY, WIS., Feb. 25—The Badger Chemical Co., organized with $500,000 capital, will establish a chemical and refining plant here. The company will make wood alcohol, with charcoal, potash and other chemicals as by-products. The incorporators are Charles Friend, Bernard Rosenow and A. E. Kopps, Milwaukee.

—

KAUKAUNA, WIS., Feb. 26—Mayer Bros., Inc., Antigo, Wis., have combined with business men of this city and organized the Kaukauna Machine Works to manufacture the Mayer power hammer, trade-marked Little Giant. The machine shop and foundry of A. W. McCean & Co. has been purchased, and production will be started in a few months. The Mayer power hammer ranges in size from 25 to 100 lb. capacity and larger sizes will be added.

—

McKEESPORT, PA., Feb. 25—R. V. Trader & Co. has been organized here to manufacture a fuel-saving carbureter for trucks. A building has been purchased and remodeled as a factory, and limited production is already going on. New machinery will be installed shortly and production increased. Philip Palmgreen, formerly with the Westinghouse Electric & Mfg. Co., is in charge of the factory.

—

Swan & Finch 65 Years Old

NEW YORK, Feb. 25—The Swan & Finch Co., maker of lubricants, celebrated its sixty-fifth anniversary recently. The business started in 1853 in a small building on Water Street, New York.

—

George K. Birge Dies

BUFFALO, Feb. 25—George K. Birge, founder of the Pierce-Arrow Motor Car Co., Buffalo, died last week. In 1896 he reorganized the George N. Pierce Co., then manufacturing bicycles, and established it firmly as an automobile manufacturing company.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Coal Shipments Moving Regularly from Mines

For the first time in many weeks shipments from the mines are moving with moderate regularity. Reports from all sections, with the exception of the New England States, indicate that the coal crisis is over. However, this does not mean that the danger of a recurring scarcity is entirely removed, but that with a continuation of good weather distressing periods such as the country has just experienced are improbable.

The chief trouble still is lack of motive power, and many loaded cars yet remain on sidings on this account. A report by Government investigators shows that thousands of cars in poor condition clog the terminals and impede delivery. Railroad companies state they are unable to get sufficient men to keep up repairs. An appeal to mining companies for the transfer of men with mechanical ability has met with some success.

The general public expressed much satisfaction at the demise of "heatless Monday." Some industrial plants are working on close margins of fuel supply. Anthracite is still scarce, though the mines are shipping large quantities to tidewater. The resumption of waterborne traffic will also aid in the movement of coal and take some pressure off the railroads.

Radical changes in distribution routes are in prospect. So great is the demand from the East that a plan of coal distribution, approved by the Fuel Administration, proposes that Eastern seaboard states shall have first choice on the output of anthracite. This means that after April 1 states in the West and Northwest will not be permitted to receive hard coal. This will be true also of Canada and the South. The mines of the Middle West will thus have their natural markets pretty much to themselves.

The committee in charge of the zoning plan seems to be making but little progress. It has been found to be a more difficult proposition than at first contemplated. Theoretically the arrangement seems ideal, but so many difficulties have beset the practical application that it looks as if the plan will not be ready for operation for some time.

The announcement that the 15 to 30c. commission which jobbers are now permitted to add to the mine price will be done away with after April 1 has been received with consternation by many middlemen. It cannot be denied, however, that the order will tend to eliminate a great deal of profiteering on the part of some operators who established subsidiary companies for the express purpose of selling coal, thereby absorbing this commission. Under the new ruling retail dealers will obtain coal at the same price, whether they purchase it from the mine or through a middleman.

A New Service

¶ Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

Production will doubtless be greatly stimulated by the order of the Fuel Administrator granting an increase of 60c. a ton for coal mined in the central Pennsylvania district. This will go far toward encouraging the investment of further capital in development work.—*Coal Age.*

—

New England Suspends Heatless Mondays

BOSTON, Feb. 27—The New England states, which continued "Heatless Mondays" after fuel administrators of the other states suspended them have also suspended them, under the fuel administration order of Jan. 17.

—

Cleveland Truck Dealers Organize

CLEVELAND, O., Feb. 26—The Commercial Car Dealers Assn. of Cleveland was formed here last week by 40 truck distributers. H. L. Schneider, manager of the Republic Motor Sales Co., who presided at the first meeting, has appointed a committee of five men to draft a constitution. This local organization will foster the work of the truck committee of the N. A. C. C. The formation of the committee was in response to suggestions made at a recent convention of truck manufacturers by Christian Girl, who is director of production of the Government's military truck division; Hugh Chalmers, chairman of the automobile industries committee, and by Roy D. Chapin, chairman of the highways committee and president of the Hudson Motor Car Co. This week will see the local association completely organized.

—

War Truck Inspection in Cleveland

CLEVELAND, Feb. 26—An office has been opened here in charge of Captain A. A. Gould for the furtherance of inspection and production of Class B, Class A and Class AA war trucks which are being constructed and which will be constructed in Ohio and neighboring states. Captain Gould was formerly in the designing department of the Peerless Motor Car Co.

Iron and Steel Industry Shows Big Improvement

The improvement in iron and steel works operations has gone further, as indicated by 75 per cent blast furnace operations at Steel Corporation plants, accompanied by 85 per cent active ingot capacity and 80 to 85 per cent in rolling mills. Some companies have not fared so well. Eastern Pennsylvania, which was hardest hit, it still very short of coke, and blast furnaces there have scarcely exceeded a 50 per cent operation, with steel works at 60 per cent or less.

Pittsburgh and nearby districts are suffering from new car shortages. Loaded cars have left the mills, but are not returning, and the giving of special priority to food shipments has resulted in the sending of empty cars all the way from the East to the far West. Coke shortages are much aggravated from this cause.

Want Prices Stabilized

Steel manufacturers will confer in New York on Friday preparatory to a meeting with Government representatives to consider the prices that will prevail after April 1. Steel producers, after months of hamperings, with steadily advancing costs, now ask for stabilized prices over a period of six to nine months. The uncertainty as to prices and pig-iron and steel supply is beginning to affect consuming industries in a number of lines, and the next conference at Washington is considered of more moment than any that have preceded it.

Foundry operations have been curtailed here and there for lack of pig iron, but there are also cases in which the demand for castings has fallen off because certain industries in the less essential class have found their sales diminishing or have had to stop for lack of fuel.

Fabricated steel business dropped to 95,000 tons in January, from the 205,000 ton total of December. When the rush for munitions plants had run its course in 1915, culminating in 208,500 tons of fabricated work in December of that year, the total for January, 1916, fell to 119,000 tons. The recent large lettings of fabricated steel for ships now leave little before the bridge and structural shops.

The scrap trade is accepting the new rulings of the regulating committee, notwithstanding the deviations from long established price relations. Opposing views on the question of commissions to holders of yard stocks have not yet been threshed out and meanwhile authority for the payment of commissions is lacking. On the decision hangs the movement of a considerable tonnage of heavy melting steel, which would require some inducement to draw it to the Pittsburgh district.—*Iron Age.*

Mitchell Making F. W. D. Trucks

RACINE, WIS., Feb. 26—The contract accepted by the Mitchell Motor Car Co., for the manufacture of F. W. D. trucks, licensed by the Four Wheel Drive Auto Co., Clintonville, Wis., is being filled. The Mitchell company became a sub-contractor under the contract which the latter company received from the government. As soon as this initial contract was given, another and larger contract was awarded direct to the Mitchell company. It is impossible to state the exact volume of these contracts, but they will doubtless aggregate $15,000,000.

The Mitchell plant has been increased in size to take care of this large volume of business.

Wilson Body to Make Airplane Parts

BAY CITY, Feb. 26—The C. R. Wilson Body Company has received an order from the Government for 1000 sets of parts for airplanes, the production of which will commence in 30 to 40 days.

Republic Buys Los Angeles Factory

ALMA MICH., Feb. 22—The Republic Motor Truck Co. has purchased a steel structure located in the 3-mile circle in Los Angeles, including 12½ acres of ground. This is to be used as a branch factory to supply dealers in the South and West and also to attend to the foreign business of the company in Japan, China, Hawaiian Islands, the Philippines, Mexico and South America.

American Truck to Succeed Blair

NEWARK, O., Feb. 26—The Blair Motor Truck Co. will within a week or 10 days sell all of its assets to a new corporation to be styled the American Motor Truck Co. The new corporation will continue to manufacture the truck and will take over the entire good will of the Blair organization. The new company is in the process of organization at the present time and will announce its new offices shortly.

Tire Machine Patent Infringed

CLEVELAND, Feb. 27—The DeLaski & Thropp Circular Woven Tire Co. has been granted an injunction restraining the Miller Rubber Co. from using tire making machines built under patent No. 1,011,450. The Miller company stated in its answer that the patent was not infringed and that the use of machines had ended before the beginning of the suit. Judge D. C. Westhaven held, however, that the DeLaski & Thropp company is entitled to an injunction and if desired a master may be appointed to state an accounting of profits and damages.

Second Chicago Used Car Show

CHICAGO, Feb. 27—The second annual used car show of the Chicago Automobile Trade Assn. will be held at the Coliseum during the week beginning March 30. The main building will be devoted exclusively to passenger cars, and in the annex accessories and trucks will be shown.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

White Erecting War Buildings

CLEVELAND, Feb. 27 — The White Co. is erecting two new buildings to be devoted to war work. They will cost approximately $500,000.

To Auction Pathfinder and Springfield Body Plants

CHICAGO, Feb. 26—Two well-known automobile plants will be auctioned by Samuel L. Winternitz & Co. The first is that of the Springfield Body Co., Detroit, which will be put under the hammer within 30 days. On March 5 the entire stock, machinery, equipment and finished cars of the Pathfinder Motor Co. of America, Indianapolis, will be auctioned. The property inventory amounts to more than $500,000.

Termaat & Monahan Wind Up Business

OSHKOSH, WIS., Feb. 25—The affairs of the Termaat & Monahan Co., maker of machine tools, gas engines and shop specialties, have been wound up with the distribution of a first and final dividend of 23.45 per cent, amounting to $21,-332.50. The company went into the hands of a receiver last September. A reorganization committee took over the plant and business shortly after, and the organization, under the style T. & M. Mfg. Co., has been in production ever since.

Hower Manager of New London Factory

TOLEDO, Feb. 25—Henry H. Hower, manager of the Willys-Knight division of the Willys-Overland Co., will become manager of a large plant manufacturing navy supplies at New London, Conn. His change of position is only for the duration of the war, when he will return to his former duties with the Willys-Overland company.

Detroit Body Enlarges Plant

PONTIAC, MICH., Feb. 25—The Detroit Weatherproof Body Co. is enlarging its plant and expects to increase its daily production of sedan tops from 150 to 250. The manufacture of truck cabs and probably other divisions of the body building business will be engaged in by the company.

Editor Automotive Industries: Through some misunderstanding we find that the specifications given out covering our 1918 model cars showed the bore and stroke as 3⅛ x 4¼, and the tires 32 x 4. Please take note of this error, the correct engine size being 3 x 4¼ and the tires 33 x 4.—Elgin Motor Car Corp., Chicago.

Detroit-Wyandotte Plant to Be Sold

WYANDOTTE, MICH., Feb. 26—The plant and business of the Detroit-Wyandotte Motor Truck Co., maker of the Horner truck, is being offered for sale by the Security Trust Co., receiver for the organization. The Detroit-Wyandotte company went into receivership in January, with inventoried assets of $200,000 and liabilities of $85,000. The plant covers 2½ acres.

Dodge Brothers Plan Arsenal

DETROIT, Feb 25—Contracts are being let for the erection of a one-story brick and steel arsenal building for Dodge Brothers.

Carde Stamping Starts Production

SAGINAW, MICH., Feb. 25 — The Carde Stamping & Tool Co., maker of tools and stamped parts used by the Hupp and Studebaker concerns, has purchased the old Bransfield-Billings plant and is starting operations. The concern is entirely financed by outside capital, but was brought to the city through the efforts of the Board of Trade. Sufficient tool equipment to give employment to 35 toolmakers is already in operation, and it is expected that the stamping department will be ready by May.

Alexander R. Pribl of Detroit is general manager, and associated with him are Clyde P. Crane, Detroit, and C. B. Castle, Cleveland.

Osborn Co. Plans Addition

CLEVELAND, Feb. 26—The Osborn Co., manufacturer of tires and tubes, is planning a factory addition in Garfield, N. J. This will be equipped to turn out 500 tires and 1000 tubes daily.

Maxwell Raises Prices

DETROIT, Feb. 26—The Maxwell Motor Sales Corp. will increase the price of all passenger car models $80 on March 1, and all truck models $100 on March 1. The prices follow:

Model	New Price	Old Price
Passenger Cars		
Touring car	$825	$745
Roadster	825	745
Touring car with winter top.	935	855
Roadster car with winter top.	910	830
Berline (6-passenger town car)	1175	1095
Berline, with wire wheels (optional)	1275	1195
Sedan with wire wheels	1275	1195
Chassis with cowl	735	655
Chassis with commercial delivery body	810	730
Trucks		
1-ton truck chassis	1085	985
1-ton truck chassis with cab and windshield	1125	1025
1-ton truck chassis with stake gate	1180	1080
1-ton truck chassis with combination box stake	1175	1075
1-ton truck chassis with combination box	1135	1035
1-ton truck chassis with canopy body	1195	1095

The prices for Canada and foreign countries will remain the same.

May Revive Racing in United States

CHICAGO, Feb. 24—Motor racing in America for the next year or so may not be taken wholly off the boards if the plans of three different sets of promoters materialize as they expect. When, in response to what is believed to have been government suggestion, the American Automobile Assn. announced last December it would sanction no more races during the war, a decided damper was put on racing as a whole, because the A. A. A. for years has been the official arbiter of organized speed contests. The A. A. A. and those in sympathy with it felt that the need of transportation facilities, fuel, and skilled drivers and mechanics was such that the continuation would be unpatriotic. It was believed that the services of the skilled drivers and mechanics could be better given to the government, either in the aviation or motor transport section.

The stepping aside of the A. A. A. from racing has made it possible for some of the organizations which heretofore have been looked upon as outlaws to have a chance at the A. A. A. stables. Of the organizations which have staged races of more or less local importance without A. A. A. sanction in previous years, two at least and several local promoters have announced plans for a rather ambitious racing season.

The whole situation is rather hazy at the present moment, but if the announcements of the promoters can be believed, and if the government does not put its foot down on racing by prohibiting fuel for transportation, it seems that we will have races at Sheepshead Bay, New York, Providence, Uniontown, and Philadelphia, as well as at the state fairs, promoted by the International Motor Contest Assn.

—

Enlist Mechanics in Milwaukee

MILWAUKEE, Feb. 25—The Milwaukee County Council of Defense is endeavoring to supply 1500 machinists and 250 toolmakers for ordnance work at the Rock Island Arsenal, in accordance with the request of Col. George W. Burr. Although many skilled mechanics have already been obtained for government service in this district, the labor situation has not been affected seriously, and the working forces of builders of truck and aviation engines, as well as military trucks, have been kept practically intact.

—

Firestone Film to Stop Waste

AKRON, OHIO, Feb. 26—The Firestone Tire & Rubber Co. has produced a propagandist motion picture play entitled "Over the Roads to War." This is intended to show the importance of rubber in the war and to prevent waste. The film shows the simple errors in driving that cause the waste of enough rubber yearly to equip 100,000 fighting motor cars, and has been indorsed by the Government for its contribution to national thrift.

—

391 Miles in 60 Hours

LANSING, Feb. 25—A Duplex motor truck completed a run from Lansing to Pittsburgh, a distance of 391 miles, in 60 hr. Fifty-nine gallons of gasoline, 5 qt. of oil and 1 pt. of water were required. The cost of the trip, including everything, was $56.11.

Bids for Mail Airplanes

WASHINGTON, Feb. 22—Three bids have been received to-day for building the five airplanes for the Post Office New York to Washington Aerial Service. These were received from The United Eastern Airplane Co., $59,000, delivery in 30 days; Standard Aero Corp., $68,000, delivery in 63 days; West Virginia Aircraft Co., $72,500, delivery in 90 days.

Second Assistant Postmaster General Otto Praeger yesterday left for a trip through Philadelphia and New York for inspection of landing sites for the airplanes.

—

Madison Has Automotive Show

MADISON, WIS., Feb. 23—The sixth annual motor show conducted by dealers and distributers here on Feb. 20, 21 and 22 was one of the most comprehensive displays ever made in Wisconsin, and, for practical purposes, may be characterized as a miniature of the 1918 Minneapolis show because it devoted exceptional attention to trucks, tractors, etc., rather than concentrating on passenger cars.

The show was held in the new warehouse of the Union Transfer & Storage Co. and covered about 45,000 sq. ft. The decorative scheme used by the Milwaukee Automobile Dealers, Inc., at the tenth annual Milwaukee show in the Auditorium, Jan. 17 to 26, was used. The management of the show this year was in the hands of the Automobile Dealers' Division of the Madison Assn. of Commerce, successor to the Madison Automobile Dealers' Assn.

National

TWELVE CYLINDER CARS

A CAR OF SOUND ECONOMY

THE greater proportion of new owners of this National Convertible Sedan are straight-thinking citizens who realize that a saving in the first cost of an automobile by no means presupposes a saving in final cost.

They quickly determine, in those cases where the price of this car is higher than others, that it represents greater intrinsic value for every dollar paid.

They appreciate that this National Convertible Sedan affords more in engine efficiency, in chassis stamina and in general durability for strenuous and incessant service.

In its sureness and reliability of action, and its extraordinary freedom from even the common automobile ills, this car most effectively conserves the time and energies of its owner and, thus, most diligently saves his money.

Powered with either the six- or twelve-cylinder (airplane-type) motor, it satisfies all needs of ready transportation with moderation in fuel, tires and maintenance costs.

Its well-equipped carriage is easily opened for summer or closed for winter, and in either form the car retains its full ability for town and country work.

National dealers find that the buying public is most favorably inclined towards the National Convertible Sedan because this car is of that unusual caliber that best meets the unusual demands of present conditions.

CASE SIX

Three-Way Economy

Comfort and Utility Without Extravagance

THE New Case Six is timely indeed. Or, better said, the times are making more people appreciative of Case Standards. For Case Cars have always been consistently built to serve the thrifty. Case always produces a car that by every standard should be priced higher. The Case Six embodies to a greater extent than heretofore supreme values at a price much lower than asked for other cars of its class.

So an initial saving is made. You may prove this conclusively for yourself by making comparisons. The New Case Six, as our Engineers have designed and built it, combines in one car all those proven features that are bound to insure steady service at minimum cost.

These Features Convince

In this car you find a Case-Continental motor, Westinghouse Electrical Equipment, a Rayfield Special Carburetor, Stewart Vacuum Fuel Feed, Borg & Beck Clutch, Grant Lees Transmission, Columbia Axles with Bock Bearings, Harvey Semi-Elliptic Springs, Jacox Steering Gear, and dozens of standardized, proven features.

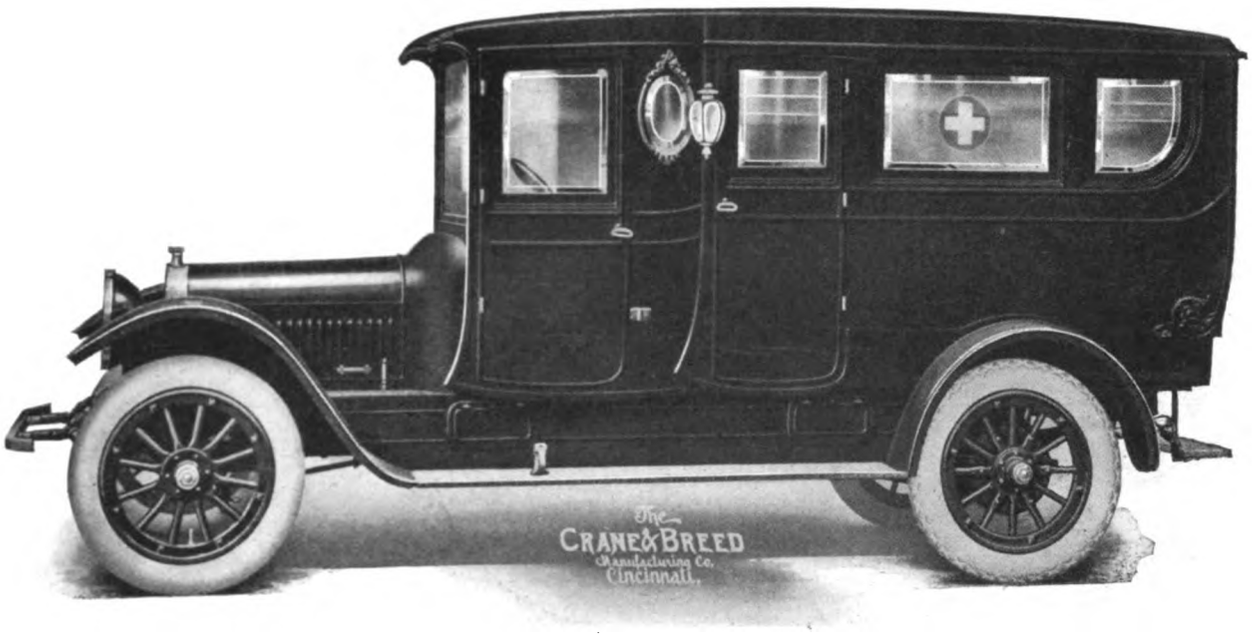
All are combined under our own supervision and unified into a car of superior performance and durability.

This insures a second saving. As you examine the New Case Six and drive it, you are assured that the Case way of construction is a guarantee in itself.

Case construction likewise leads to economy of operation. In choosing only standardized and proven units, the aim was also to include those which reduce the mileage cost.

Maximum power at minimum cost—this is a Case principle. And in our New Case Six we reach greater efficiency than ever before. Do not decide on which car to buy until you know the New Case Six. It will save you much in the beginning and in the years to come.

J. I. CASE T. M. COMPANY, Inc. *Founded 1842* 234 Liberty Street, Racine, Wis.



DEALERS: There are several splendid opportunities for Case dealers in different parts of the country where the New Case Six is receiving marked attention from the public. Write today to ascertain if this applies to your community.

Champion Toledo

Dependable Spark Plugs

Keeping Champions Profitable for the Jobber

Not merely profitable, but very much *more* profitable!

Against gross profit you Jobbers must charge general overhead, carrying cost and selling expense to find your net profit.

You can make your carrying cost almost negligible on Champions because they move in such large volume and such steady volume.

We make your selling cost almost negligible by steadily, persistently and forcibly stimulating the tremendous natural sale of Champions.

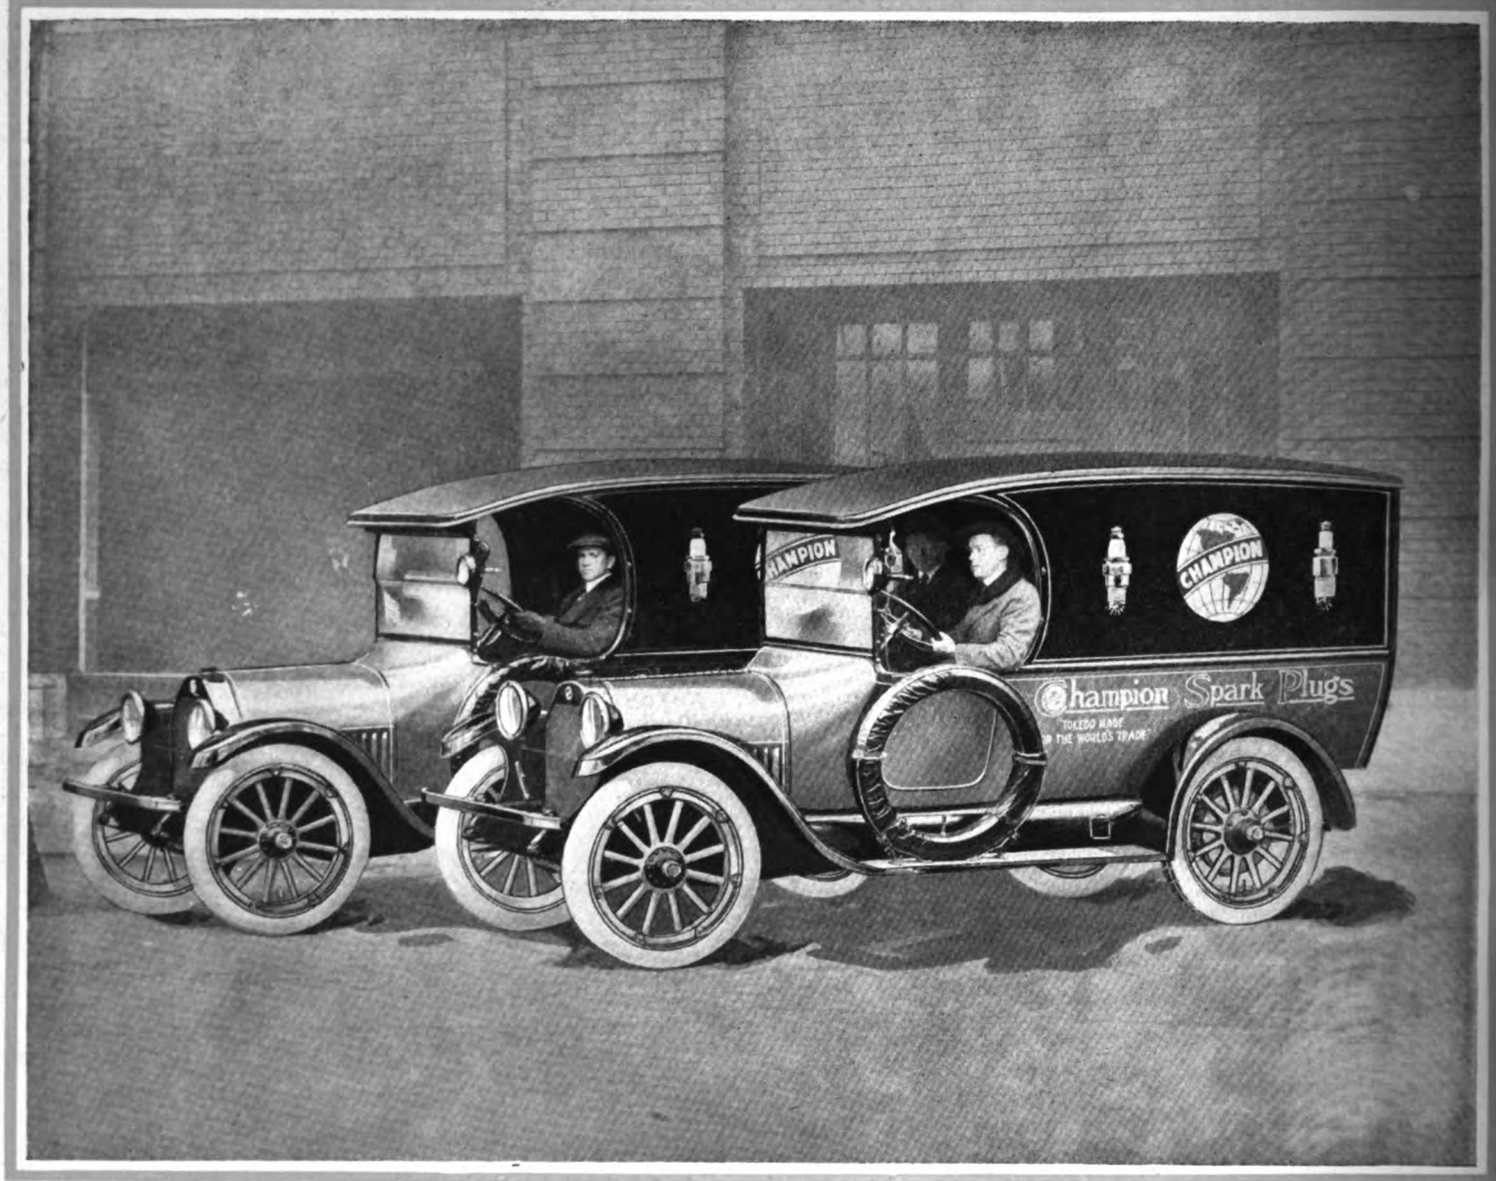
Our investment in advertising is many times that of all other producers of spark plugs combined.

And that investment is returned *to the Jobber* many fold in lessened selling expense.

That is our conception of advertising—a means to increase profit by decreasing selling expense—for ourselves—for the Jobber—for the Retailer.

In the Saturday Evening Post, Literary Digest, Collier's and other general-circulation periodicals—in twenty-five of the leading farm papers we use bigger space and vastly more total space than all other spark plug producers combined—a total of more than one hundred million advertisements printed and circulated this year.

All this is working steadily to establish, maintain and increase the Jobber's profit by decreasing selling expense and accelerating turnover.



All this is working to make Champions not merely profitable but very much more profitable for the Jobber than any and all other spark plugs.

Champion Toledo

Dependable Spark Plugs

Here are two of twenty-three Advertising Cars, each carrying a crew of trained window trimmers over the entire country and cooperating with the Jobber and Dealer in the Champion Spark Plug merchandising and advertising compaign.

Digitized by Google

Their job is to arrange window and counter displays for supply dealers, hardware stores and garagemen to localize the full force of our national advertising on the Retailer's store or garage.

When they come to you, let them arrange a display that will give your spark plug profits a big boost.

Champion Toledo

Dependable Spark Plugs

Establishing, Maintaining, Increasing the Retailer's Profit

Just as the Jobber's profit is increased by Champion advertising so is the Retailer's profit also increased.

And to bring the great force of the more than one hundred million Champion advertisements printed and circulated this year directly to bear upon the Retailer's sales.

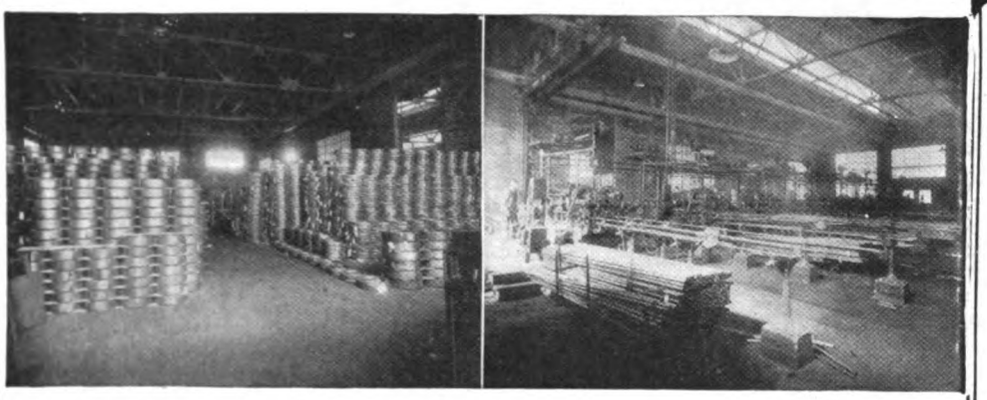
We supply the Retail Dealer with attractive counter display and window display matter to focus the local force of all this advertising directly upon his store or garage.

The cost of all this advertising is returned to the Retailer many fold in lessened selling expense and accelerated turnover.

And the Retailer's opportunity to directly cash in on the force of all this advertising is more favorable than our own opportunity or the Jobber's.

We distribute it broadcast, the Jobber profits by its general force in his territory but the Retailer can focus all its local force right on his individual business by using the window display and counter display matter which we furnish.

To increase his spark plug profits, the Retailer has only to keep a full, clean stock of Champions and focus the force of our advertising on his store or garage.



It is a vastly greater force than any similar force behind any or all other spark plugs.

Why We Deliver Promptly

Having our own strip steel mill, we produce "Elisco" tubing from the raw material to the finished product in our own plants.

This assures for our customers the advantage of prompt and regular deliveries on all orders for—

ELISCO

Light-Gauge, Cold Rolled STEEL TUBING

—the only welded steel tubing made by automatic machines combining ***all six*** operations in ***one.***

TUBING:

Cold drawn; ¼ inch to 3 inch O.D. light gauge. Hot-rolled, high carbon, butted and brazed; ⅞ inch to 2⅜ inch O.D., 11 to 17 gauge.

STRIP STEEL:

Cold rolled; .035 and thicker, width up to 12 inches. Hot-rolled, .065 and thicker, widths up to 8½ inches.

BARS:

Hot rolled. Square bars 1¼ inch to 2½ inch inclusive. Flats, widths up to 8½ inches.

SHAPES:

Channels, 3 inch, 4 lb., 5 lb., 6 lb., and 4 inch, 5¼ lb. sections. Angles 2½ and 3 inch equal leg. U-bars and special shapes of moderate dimensions in hard and soft steel.

Let us figure on your requirements.

Please mention Automotive Industries when writing to Advertisers

The several parts of the Dohner coupling consist of the main body of the coupling, the tapered nut and the tapered thimble. In adjusting, the end of the tubing is slipped through the nut and thimble into the body of the coupling up to the shoulder, and by simply tightening up the nut the operation of fastening the tube in place is automatically performed.

The Rings "Bite" Into the Tubing

The "Rings in the Thimble" constitute one of the main features of the Leakless Dohner High Compression Coupling—which engineering experience **proves** is the **only really effective** coupling.

These "Rings" bite into the tubing. Tightening the coupling nut automatically compresses or transfers the rings from the outside to the inside of the thimble.

Thus the rings, "bit" into the tubing, produce a **practically welded joint**—absolutely air tight and entirely unaffected by vibration.

The Dohner "Leak-Proof" Coupling can be disconnected by loosening the nut in the ordinary way, and connected again by tightening the nut,—the coupling remaining as effective as when first used.

Because of the labor saving insured by the Dohner Coupling, it is regarded by engineers and production managers as the most economical coupling made. Its quickness and simplicity of installation cuts a considerable percentage off production costs.

Well engineered and efficiently produced motors, such as Maxwell and Buick, use Dohner Couplings exclusively;—Buick will install 3,000,000 "Dohners" this year. The Baldwin Locomotive Works,—famous for careful engineering—after exhaustive tests adopted the Dohner Coupling for its locomotives.

Dohner Couplings are particularly well adapted for aircraft because of their light weight, stability, quick reconnectability and efficiency.
We will gladly supply further information on request.
Note: The Dohner line is complete, including unions, Ells, Tees, etc. Pat'd. June 13, 1916.

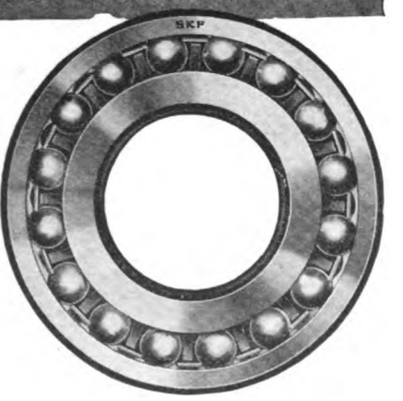
Ponderous in Weight—Nimble in Action



The clang of the fire alarm must find the mechanism of the big self-propelled fire apparatus in fighting trim. Every part must be tuned to concert pitch and operate at maximum efficiency. The double row of balls and the self-aligning feature of SKF prevent wear and heating due to weave of the chassis. Under heavy overloads and sudden shocks the inner race, balls and retainer are free to pivot in the outer race. The pump mechanism too is another vital place—and SKF at this point are used by the Ahrens-Fox Fire Engine Co. No matter for what service SKF with their highly tempered races and balls are adequate to any emergency.

DRIDEK—

With the Leather Finish

TRADE DRIDEK MARK REG.

DrideK with its leather finish, is an entirely new creation, based on many years' experience in furnishing tops and upholstery for the majority of the cars that have been put on the market.

DrideK looks as well as the best of leather. The distinguishing features in the wear of DrideK are: that you cannot scratch the finish; that it retains its color until entirely worn out; and that it is absolutely waterproof.

The product is unquestionably superior, and the price is within reach of your specifications. Made in black and many attractive colors.

DISTEEL WHEELS

DISTEEL WHEELS

Greater Beauty, in addition to greater comfort, security and ease in motoring, is the prime reason for the design, popularity and admitted superiority of Disteel Wheels. No matter how beautiful the lines of the car, Disteel Wheels enhance and complete that beauty. The arrival of the Disteel Wheel is an event as epoch-making in motor car design as the introduction of the electric starter.

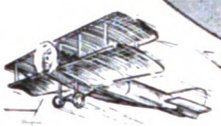
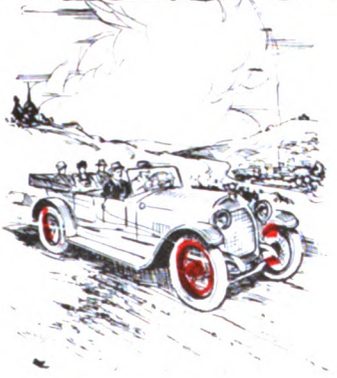
What "Pasco" Means on the Hub Cap



1—The strongest wire wheel because of the patented spoke lacing. Each spoke, in both front and rear rows, crosses four other spokes—as against two or three crossed spokes in other makes.

2—The safest wire wheel because the hub cap and wheel are locked on by the patented locking device and can only be removed by loosening the lock and using the Pasco wrench.



3—The wire wheel with an indestructible Hub Cap. A Hub Cap built sturdy, massive looking, attractive and capable of withstanding any conditions of jams or collisions where others strain or break.

In their simplicity of design and construction, in their easy accessibility of parts, in the quickness and facility with which they can be changed—Pasco Wire Wheels are unique—they are the wheels of progress—no whit of anything that could make them better has been neglected.

PASCO WIRE WHEELS

Pasco Wire Wheels are genuinely economical. They mean less upkeep expense, less tire expense, less fuel expense—and a distinct saving of time and trouble.

Their distinctive appearance, their look of speed and class and their beauty make, in Pasco Wire Wheels, the one great dealer opportunity of today.

Pasco air plane wheels are now in use on practically all types of air planes.

Dealers—Write for our selling proposition.

Know Harrison Radiators for Their Selling Value

If the cars you handle are equipped with Harrison Radiators you have a talking point that will help you sell them.

Show your prospects how Harrison construction, although the lightest per cubic inch, nevertheless has such "inbuilt" strength that a leakage from a frozen core is practically unknown.

Tell them the Harrison cooling system embodies greater fuel economy due to higher cooling efficiency.

Point out the big, free Harrison Hexagon air passages and explain why they promote cool, easy-flowing water circulation.

Tell them that Harrison lightness of weight, Harrison durability and other Harrison qualities are direct results of the peculiar arrangement and construction of the Hexagon cells, original with Harrison.

The list of Harrison users is another advantage to you. This representative list of cars, itself, adds prestige. Don't overlook the value of the name Harrison to you in making sales.

Ford Owners!

That Grabbing—Slipping—Chattering no longer is necessary

Cork Insert Transmission Linings end it. They eliminate the jerk and jar, the slipping and jumping, the rattle and chatter, the shaking loose of nuts and bolts, the severe wear and tear on engine differential and other parts.

Cork Insert Linings enable you to start and stop as smoothly and quietly as with a big car. The Ford picks up with gratifying smoothness and glides to a quick, gentle stop with little pressure on the pedal.

$3 per set of 3

ADVANCE CORK INSERT

TRADE MARK REG. COPYRIGHTED 1917

TRANSMISSION LININGS FOR FORDS

stop the slipping through the use of buttons of cork—a patented feature no other lining can have. Cork never gets hard or polished. It's hard, polished linings that cause all the trouble in ordinary transmission linings. Cork Insert Linings don't slip—don't grab. They make the smoothest, safest, most economical linings for Ford transmission ever devised. They give a better driving, better braking car, and a lining that outwears ordinary linings three to one.

Ford Motor Kept Cool—Fan Kept Fanning by Fan Belt that Doesn't Slip

When the Ford fan belt runs as it ought, the Ford motor is kept cool and overheating is avoided. But the fan can't fan properly if the belt is slipping and lays down on the job. The slippage of the ordinary Ford belt runs as high as 25% to 50%.

ADVANCE CORK INSERT

TRADE MARK REG. COPYRIGHTED 1917

FAN BELT FOR FORDS

stops slipping. The buttons of cork, unaffected by water or oil—grease or dirt—grip at the first turn of the motor and keep the fan fanning. Cork Insert Fan Belts outwear several ordinary fan belts and do the work better as long as they last.

DEALERS—Order From Your Jobber!

Order at least a dozen sets of Cork Inserts next time your jobber's salesman drops in. Cork Inserts mean better profits for you—better service and satisfaction for the user. They are the livest line in the field. Strongly advertised. Your customers know about them. Stock them and they'll move fast. Send coupon if your jobber can't supply you.

HOW few people realize that New Departure Ball Bearings bear the same loads and resist the same stresses, for which the massive truck axles and shafts are built!

That New Departures should be at once giants of strength and conquerors of bearing friction—what a triumph of American engineering genius.

It is an intensely practical matter—this laying out of New Departures for their chosen jobs. Chance or risk have had no place here. Each bearing has a *known* capacity and each recommendation a liberal "bridgebuilder's factor of safety."

When a layout has our engineers' O. K. you can *bank* on the performance of those bearings!

More and more men are learning that fact every day. If you are yet to be shown—all we ask is the opportunity.

The Height of Lens Development

THE Dillon Multi-Vision Lens marks a new era in lens performance. Not only is it a radical departure in design, but it is evolutionary in results.

The central bull's-eye, for instance, is an exclusive advantage of the Dillon. This bull's-eye has an important function—that of concentrating and magnifying the light on the road. This light is made glareless by the light from a carefully determined proportion of clear glass above the bull's-eye. The clear glass at the bottom provides the necessary front and side lighting.

The Dillon is the only lens made that gives you TWICE the lighted area, by projecting a SQUARE path of light. It is also the only lens made that projects entirely beyond the rim.

In no respect is the Dillon excelled and any of its chief features alone make it supreme in its field.

Write for literature, or send cash, check or money order, together with make and model of your car if you cannot obtain Dillon Lenses.

THE SIOUX VALVE GRINDER

Every Mechanic Needs One

Price, complete, $6.00.
Liberal Discount to Dealers.

Have one for your very own—keep it where you can always find it when you need it. Don't depend on one tool for the whole shop—don't waste your time trying to work with a makeshift outfit. Get one of these strong, efficient grinders for your own tool kit.

New Principle Saves Labor

A continuous movement of the handle in one direction gives the valve the reciprocating or "forward and back" motion, which is absolutely necessary for perfect valve grinding, much faster and easier than the old bit and brace or screwdriver method.

Ball Bearing Throughout

This feature insures easiest action and least wear on bearings — makes jobs short and easy. Five interchangeable driving points—will fit any valve. Perfect balance and perfect stroke. Materials and workmanship of the best. Will last a lifetime.

It will Pay You to Investigate

You are wasting your time, if you are not using the most efficient tools you can buy. Think how much you need this grinder—then go and examine one—today.

Sold by all live jobbers.

Opportunity has a hot foot and a crick in her neck

She can't look 'round and won't turn back for the man who misses his date with a big chance. From confidential sources we learn that she's headed your way with the best proposition of the year—the Maxwell truck. Dealers who have sold several thousand Maxwells since August of this year have a very convincing bunch of balance sheets, and retailers, manufacturers and producers in scores of different fields are ready to furnish further evidence that there's more money to be made in a hurry and without a worry through a Maxwell truck agency than any equal investment of time and a little capital has yielded in a coon's age. Somebody in your town is going to profit handsomely through the smashing advertising campaign soon scheduled to break: in words of the well-known song "It might as well be you." (Set the alarm clock early, see your banker and get busy.)

MAXWELL MOTOR COMPANY, Inc., DETROIT, MICH.

How Much Can You Trade It In For?

The test of automobile value is the price you can get for a used car; and that price is increased or decreased according to the condition of the engine, bearings, gears, and other moving parts.

Are you protecting those parts?

Figure how the yearly cost of the machine's operation, repairs or depreciation may vary.

Compare it with the slight yearly cost of scientific lubrication. Scientific lubrication does more than protect the service of your car; it protects the price you get when you trade it in.

The next time you buy oil or grease for your motor car, remember the actual saving you will make by insisting on scientific lubricants.

Automobile owners, manufacturers, machinery owners: this is the time of all times to consider operating costs and how they might be reduced by scientific lubrication.

Permit us the opportunity of offering the benefits of our 65 years' experience. Write for details.

SPECIALTIES

Automobile Division

These products can be obtained from most good dealers and garages. Send direct for complete information, mentioning your dealer's name.

☐ **GEARESE**—A correct lubricant for motor car transmissions and differentials.

It follows the gears continuously, leaving no spot where metal can touch metal. Gearese insures against wear, reduces friction and insures a silent, smooth-running car. Gearese maintains its lubricating consistency under all temperatures—does not cake on the walls in coldest weather, nor break down and run out, under heat.

Gearese should be packed into your gear case and differential about once a year.

☐ **CUPESE**—A special quality cup grease, produced by the exclusive Acaloric Process. It is made in all densities, from very light to extra heavy. Its uniform functioning under all conditions, makes it ideal for wheel bearings, brake connections, gear and clutch levers, universals, spring leaves and bolts, steering arms and knuckles and axle caps.

Cupese spreads rapidly, adheres to the bearing surfaces, is tenuous and elastic, absolutely prevents metal-to-metal contact. It does not liquefy or evaporate under intense heat—does not cake at low temperature—does not clog bearings or leave residue in cups. It is **all** lubricant.

☐ **MOTUL**—A superior quality oil for the protection of automobile motors. Motul is made by a special process which insures super heat-resisting qualities. Although the heat of explosion in the cylinders is terrific, Motul maintains its lubricating consistency—keeps friction under control—protects your motor, bearings and cylinders. Under test Motul shows a minimum of carbon residue.

☐ Check here for descriptive literature.

For Foundries

☐ **ICORUL**—A special quality liquid core binder that meets the eleven essentials of uniform and economical core making for malleable and gray iron casting.

☐ Check here for descriptive literature.

SPECIALTIES

For General Machine Use

☐ **SLO-FLO**—A super-lubricant, made by the Acaloric Process. Does not climb, drip or spatter. It is adhesive and cohesive—heat and pressure resisting—non-volatile. It is extensively used:

—particularly for delicate, fast-running machinery in textile and other mills, in printing shops, etc., where neither a fluid oil nor a dense grease is practicable. Slo-Flo stays "put," yet lubricates instantly and constantly.

—for roller bearings in mine cars, automobiles, etc.—for hydraulic pumps, line shafting, lighting dynamos in railway cars.

—in railway and machine shops, in industrial and power plants where excessive heat and bearing pressures must be overcome and where oil is impracticable or grease impossible.

☐ Check here for descriptive literature.

Miscellaneous

☐ **TEXTUL**—A special oil compound which has all the good qualities of Red or Lard Oils—yet offered at far less cost. Textul saponifies readily—carries well through the carding process and needs no alkali added for emulsion.

☐ **ASBESTESE**—A special asbestos and wool-mixed grease combination for steam, electric and logging railways, traction lines, contractors'- and mine-car journal lubrication, etc.

☐ **AERUL**—A practical quality oil for aeroplane motors.

☐ **MARINUL**—A world-known special oil, produced to meet the excessive stresses of marine service.

☐ **TALESE**—Die-swabbing requires a product which will perform an absolute separation of the metals, have a low flash tendency and function with a minimum of smoke. These requirements are met by Talese at surprisingly small cost.

☐ **EXESE**—The 600° F. lubricant for oven gears, bloom cars or lubrication under excessive heat conditions anywhere.

☐ **VESUVESE**—A waterproof lubricant, for exposed gears—for wire cable dressing.

☐ **LARCUL**—A practical, economical metal-cutting lubricant.

Also—☐ Atlas Cutting Oils, ☐ Atlas Tempering and Quenching Oils, ☐ Atlas Leather Oils and Greases, ☐ Atlas Fish Oils, ☐ Atlas Spindle and Loom Oils, ☐ Atlas Wool Oils.

Automobile and hardware accessory jobbers and dealers are offered unusual co-operative opportunity with a quality line. Write for details.

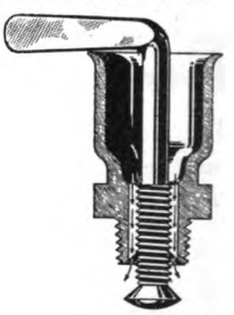
PATENTED
KANT KLOG
THE PRACTICAL PRIMING CUP

The Kant-Klog Primer

is rapidly being adopted as standard equipment by automobile builders because—

it is an innovation of efficiency and low cost—

it solves the problem of cold weather starting to the entire satisfaction of the user and can't clog with carbon because of its very construction.



The simplicity of the Kant-Klog Primer is seen in the sectional view. No part of the valve is exposed. There is plenty of clearance for the free flow of gasoline direct without waste when priming. There is no chance of carbon getting past and collecting on the seat. There is no need of removal even after months of non-use.

The more Kant-Klog is used the better its seating action.

Quotations on variations of our standard design to suit different type motors—promptly furnished.

Kant-Klog prices are surprisingly low.

Write today for particulars and free sample.

Note the Simple Construction

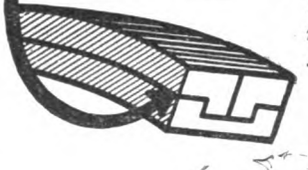
EVER TIGHT
PISTON RINGS

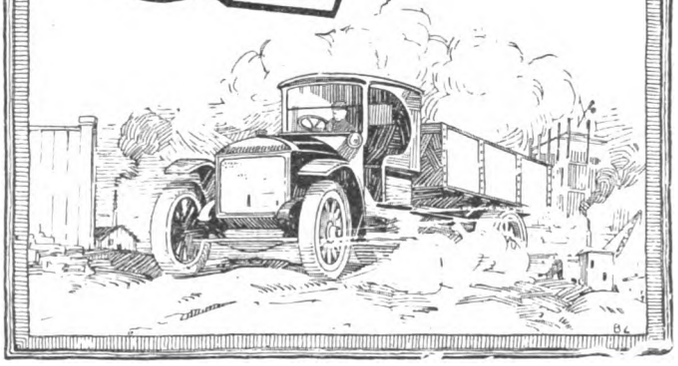
Sensible Gas Conservation

Power saving is imperative. Duty and sound sense both demand, "Stop that waste in leaky cylinders."



Dealers and Repair Men can eliminate waste and cure balky motors by fitting Ever-Tight Piston Rings.

They are gas-tight, oil-tight, elastic. Conform precisely to cylinder walls, even if out of round. Insure perfect compression and effective suction. Obviate carbon deposits and reboring. Prevent power loss from imperfect mixture, smoky exhaust and fumes. Demand them and avoid imitations.



To the Motor Trade: Ever-Tight Piston Rings satisfy your customers and pay you a good profit. Write your jobber.

EVER-TIGHT PISTON RING CO.
1501 Kingsland Ave. St. Louis, Mo

The right-angle interlock is your safeguard

This perfect three-piece construction justifies the name—EVER-TIGHT. These close fitting right angles are absolutely gas-tight.

Electric Auto-Lite

Starting—Lighting—Ignition

Electric Auto-Lite equipment for automobiles is as famous for the service that backs it as for the reliability and economy of its operation.

ELECTRIC AUTO-LITE CORP.
Home Office and Factory: Toledo, Ohio
New York Detroit Kansas City San Francisco

PHILBRIN

DUPLEX IGNITION

—with a second system to spur the motor to super-service.

COMBINES two separate and distinct systems in one—a Single Spark System, most economical of gas and offering vastly increased power. A Secondary or High Frequency System which delivers to each cylinder a stream of a thousand sparks a second—overcomes abnormal conditions, such as foul spark plugs, poor fuel, poor carburetion, and cold cylinders—*offers 100% Assurance against ignition failure.*

Easy to install, moderate in price. Descriptive catalogues and our special sales proposition on request.

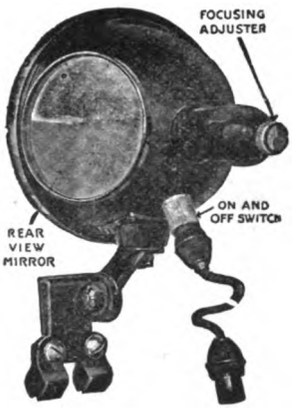
MARVELITE
Alight at Night

Marvelite applied to dials of any description makes them easily readable in the dark—the darker it is the better. No lights required.

Marvelited Dials

are the kind to use on autos and aeroplanes and on gauges and other instruments, because—

1st. MARVELITE is made with real radium.
2nd. MARVELITE is the product of the famous Schlesinger Laboratories—one of the largest producers of radium in the world.
3rd. It is permanent for all practical purposes.
4th. It is the luminous compound selected by the United States authorities, meeting the strict Government requirements.
5th. Prominent manufacturers have also selected it from the field because of its demonstrated qualities.
6th. MARVELITE is not dependent upon exposure to artificial light for its luminosity. Such phosphorescent products are short lived and unsatisfactory.



Manufacturers—Send us a dial and hands to be treated, without charge, with MARVELITE. It will prove itself. MARVELITE can be applied by you or by us. Estimates submitted.

Ask for Booklet No. 2—Valuable information about luminous compounds.

This Illustration Shows WHY Hoover Steel Balls are recognized throughout the world as the finest in construction. The Hoover chrome steel, hard surface, tough center ball, provides for steel contraction and expansion and allows for fatigue in service. Breakage is eliminated. In five years, with millions of Hoover steel balls in service, there has not been a single report of breakage. That a majority of mechanical engineers recognize the scientific correctness of Hoover Steel Balls is proved by the fact that 95 per cent. of all motor cars are Hoover equipped.

WANTED

Information as to concerns who can handle the following lines of Surplus manufacturing work:

Castings (steel, brass, bronze or aluminum)	Machine Parts	Drop Forgings
Dies	Gear Cutting	Lathe and Milling Machine Work
Tool and Die Work	Grinding	Patterns (wood and metal)
Metal Stampings	Cam Cutting	Plating
Punch Press Work	Bar and Clutch Work	Automobile Stampings
Screw Machine Work	Forgings	

We have a very attractive contract work promotion proposition to present to any concern who can take on additional work or desires to feature their manufacturing facilities.

"And everything they touched turned to gold"

So ended the recent address of a 4,000 car a year Maxwell dealer in referring to the "group of Maxwell men" who are now running the Chalmers business.

What he meant were figures like these:

Maxwell dealers	MADE	*in 1913-1914 over*	$2,500,000
Maxwell dealers	MADE	*in 1914-1915 over*	$4,700,000
Maxwell dealers	MADE	*in 1915-1916 over*	$8,000,000
Maxwell dealers	MADE	*in 1916-1917 over*	$12,000,000

And if it is sound logic to reach a Chalmers conclusion on a Maxwell premise there sure are big years ahead for those fortunate enough to have the Chalmers line.

Today the Chalmers plant is shipping a 100% better car than ever bore the Chalmers name and shipping 200% more cars than 60 days ago!

Prompt and personal attention will be extended to any dealer wishing information about the Chalmers account in his town.

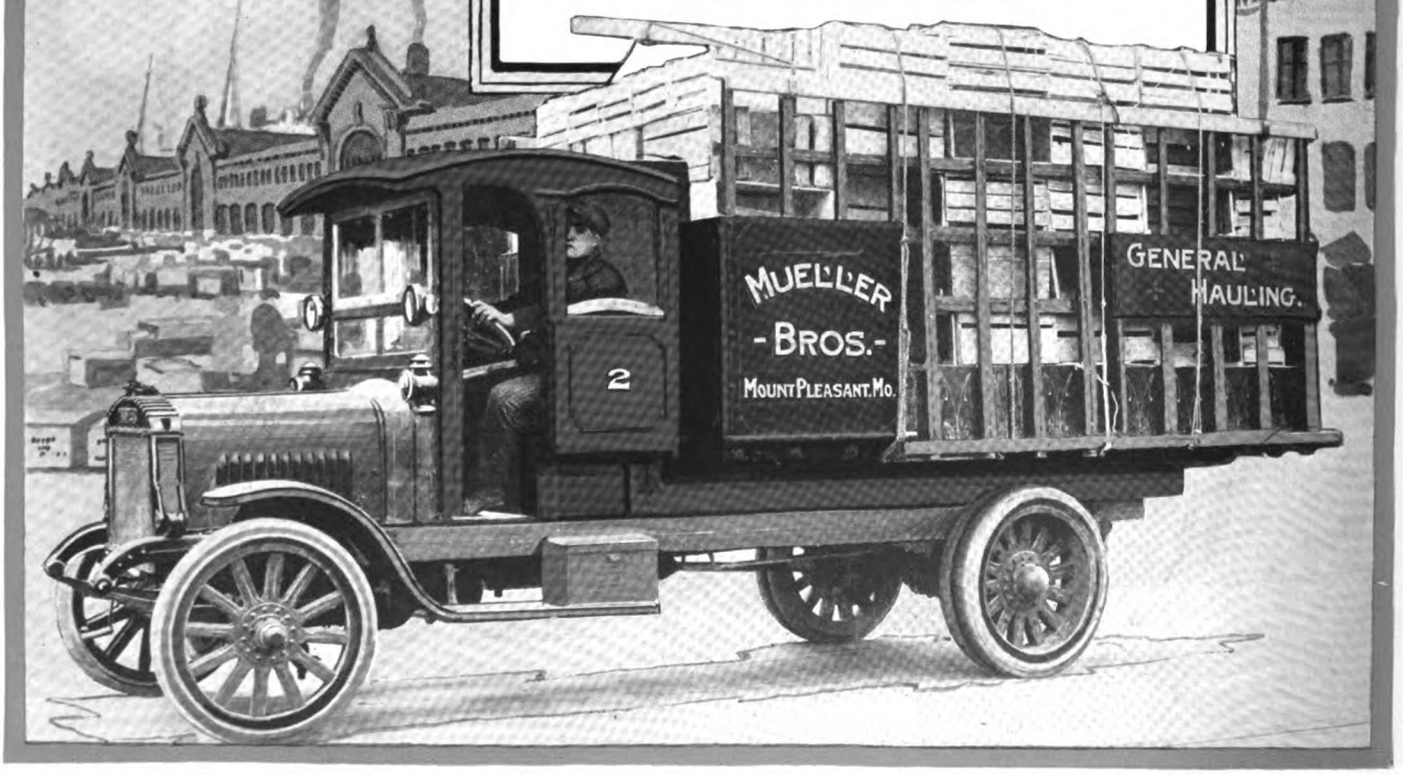
MASTER TRUCKS

Buying Miles at Lowest Cost

A truck manufacturer may use recognized standard units and still fall far short of building a truck that will stand the grief of every day hauling.

The individual part is not always a true index of the strength of the truck. It is the successful co-ordination of superior units backed by engineering skill that *makes* the truck.

In this essential, the Master excels. Fifteen years of truck engineering and truck building experience is built into every MASTER TRUCK. Every part employed is a known standard and a leader in its field. This is why the MASTER is the truck without a single weakness.



Master of the Load on Any Road

The miles you expect to get out of a truck have been built into the MASTER by Master engineers. You *will* get them out at lower cost than you will pay for other truck-miles. The power and all necessary speed is there.

A limited number of good territories are open to dealers of proven standing and ability. The MASTER is backed by men of reputation, and millions of dollars, and we are in a position to make prompt deliveries. Write for dealer's proposition. Do it at once.

The MASTER line is complete—2 ton, 3½ ton, 5 ton trucks, 6 ton tractor.

RUSCO

BRAKE LINING

THE CHOICE OF AUTOMOBILE MAKERS WHO STUDY QUALITY

Several large manufacturers of automobiles have chosen Rusco as factory equipment for years. They chose it first because their own exhaustive tests proved the inherent super-quality of this brake lining, and they have continued to choose it because, year after year, Rusco has set a distinctive standard of service to the car owner.

The superiority of Rusco is the result of more than three-quarters of a century's experience in weaving, an experience that has taught us to make Rusco so good that it has the same dependable efficiency when it is worn down to less than an eighth of an inch that it had the day it was first put on the car.

Rusco is woven on specially constructed looms, and has for a base a superior quality of long fibre asbestos. This is interwoven with brass wire and then impregnated with our secret wear-resisting, oil, water and dirt proof compound.

If your cars are not now factory equipped with Rusco brake lining, we will welcome an opportunity to send you samples for tests, or put at your disposal our engineering experts, who are prepared to offer suggestions regarding your special requirements.

The New Way to Mend Radiators

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, motor head gaskets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks in just a few minutes without laying up the car. No mechanical experience is required—all you have to do is remove the cap and pour the cement into the radiator.

JOHNSON'S RADIATOR CEMENT

Quick—Efficient—Harmless

Johnson's Radiator Cement contains no powders, cement or anything which can coat or clog the cooling system and is absolutely harmless in every respect. It will ordinarily seal a leak from two to ten minutes.

Johnson's Radiator Cement blends perfectly with the water until it reathes the leak—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water making a permanent seal.

Quarts, $1.75 Pints, $1.00
Half-pints, $ .65

VOL. XXXVIII NEW YORK—THURSDAY, MARCH 7, 1918—CHICAGO NO. 10

New York State Failed to Remove Snow

War Trucks Average 37.4 Miles Per Day in Empire State, but 67 Miles Per Day Over the Detroit-Seaport Route—Snow Removal Caused the Difference

By David Beecroft

MOTOR trucks for war use in overland drives from the factory where manufactured to seaport have been averaging 67 miles per day for distances up to 600 miles and higher, yet railroad freight cars in the same zone of country have only been averaging 21.1 miles per day. Both of these figures represent winter possibilities, although the motor truck performance was in the midst of exceptional snow, whereas the railroad car situation represented the average for the month of November in what is known as the Eastern railroading district.

These figures not only emphasize the ability of motor trucks for winter work but we have the unexpected fact that this motor truck average was made on the war truck route from Detroit to seaport through the States of Michigan, Ohio, Pennsylvania and Maryland, and not as many might imagine through such states as New York, New Jersey, Connecticut or Massachusetts, so justly renowned for their model highway systems.

War motor trucks traveling from Buffalo to seaport over the time-famous Boston-Albany route and thence down the scenic Hudson have no such favorable report to show on maintained speeds. The best speeds over this route have shown averages of only 37.4 miles per day, or very little more than one-half the sustained speed that has been made over the Detroit-seaport route.

Here we have what appears as a real paradox in so far as improved highways in relation to motor truck performance is concerned. From Buffalo to seaport, 666 miles, there is a veritable water-level highway of the most modern kind all of the way, as compared with over 250 miles of mountain roads on the Detroit-seaport route. If the Detroit route makes possible a sustained speed of 67 miles per day the Buffalo route by all rules of comparison should have made possible certainly a higher sustained speed.

Four States Removed Snow

The reason for this discrepancy, this condition which is diametrically opposite to what might be expected, lies in the snow situation. On the Michigan-Ohio-Pennsylvania-Maryland route all four of the states rose to the war necessity of removing the snow in order that the Government might drive its war trucks overland and thereby not only economize on railroad cars but train truck drivers and truck mechanics in the work that they must do when reaching France.

New York State, contrary to expectations, failed to respond in the snow removal work and instead of trucks averaging 67 miles per day over the fine state roads their average was cut to 37.4 miles per day. It was solely due to lack of snow removal.

From Buffalo to seaport, 666 miles, required eight-

Digitized by Google

een and one-half days; from Detroit to seaport, 570 miles, required but eight and one-half days. Had the Buffalo trains averaged 67 miles per day, which they can with ease when the roads are clear, they would have made the trip in ten days and saved eight and one-half days on the trip.

At the time these trips were made General Pershing was cabling urgently for trucks and more trucks. It has apparently been necessary for the American expeditionary force to buy motor trucks in great quantities from some European countries. It has apparently been necessary to rent other trucks at high rentals from other European countries in order to meet our imperative requirements there.

What happened to New York State?

Why was it that Pennsylvania was able, beginning in December, to keep its highways clear of snow, including over 200 miles of mountain roads?

Why was it possible for the State of Ohio to keep its share of the Detroit-seaport route clear of snow as the war department desired?

Why was it possible for Maryland to keep its highways free of snow?

Why was it possible for the State of Michigan to literally build 10 miles of road on the Detroit-Toledo lap of the journey and keep the snow removed for the entire distance within its boundaries?

No State Fund for Snow Removal

But what happened in New York State? There are many legal and technical explanations: There was no State fund for snow removal. Such was not contemplated in the scheme of road maintenance expenditure within the Empire State. If snow had to be removed, the work must be done by the local authorities in the towns and cities and not by the State. The net result was that the snow was not removed. The trucks averaged 37.4 miles per day instead of 67 miles per day.

The same or similar snow handicaps existed in all of the States on the Detroit-seaport route. There were not any fat snow-removal appropriations dust hidden on the legislative shelves of the States en route. Pennsylvania, which cleared its share of the route beginning in December and kept it clear, financed the work by the State Highway Department. Here there were no special snow-removal funds, but use was made of $500,000 of a State emergency fund of $2,000,000. With this amount the State did not ask for volunteer work by farmers along the route, except in some instances at the first December snow blizzard. The State Highway Department organized for the work and carried it out.

What Was Done in Ohio

The State of Ohio did not have special snow-removal funds, but here the State government worked through the local authorities, and where local authorities had not sufficient money to do the job the State made necessary advancements, although there does not appear to have been any direct authority to warrant such expenditures. They were made as war emergency acts, in that the State had been asked to do its share of the snow-removal work and keep its route cleared of snow.

Michigan and Maryland, at both ends of the route, kept their respective stretches clear from the first snow fall, and in fact the State of Michigan went so far as to undertake to keep many of the main routes of the State open during the winter months.

But New York State, although specifically requested from Washington to clear its roads, failed to respond and we paid the price on the other side of the ocean. Apparently many failed to realize that in war times war emergency acts are not only desirable but necessary and justifiable. Apparently it was not realized that eight and one-half days saved by the trip from Buffalo to seaport is equivalent to eight and one-half days being saved with our forces in France.

610 Firms on War Work in New York

It is understood that there are 610 firms in the State of New York working on war contracts and that this number represents approximately one-quarter of the total number of firms in the country engaged on war contracts. If snow-removal activities bear any relationship to war contracts then New York State failed quite badly to give that account of itself which it should have given and which it should give as the premier State of the Union.

The States of Pennsylvania and Ohio, both great manufacturing centers, are reported to have within their boundaries one-quarter of the total number of firms engaged on war contracts. They responded to the snow-removal call.

Snow removal from main trunk highways has not yet been considered a necessary and highly essential part of the road maintenance work of a State. In other words, our improved State highways have been spring, summer and autumn highways, but only for fractional traffic in winter. War is no respecter of seasons, and while our troops on the front may be more or less inactive in wintry seasons those are the seasons when our home activities should be greatest in order to have ready for them at the opening of the spring drive all of the necessary sinews and munitions of combat.

War Demands New Methods

At home we must get this fact into our peoples and into our State governments. War emergencies and war necessities have demanded new orders of things. It is an example of new wine and new bottles must be used as well. The days of tying up our trunk highways from large manufacturing centers to seaport have passed. We do not send our soldiers to the shores of the Mediterranean to holiday in the winter months. They toil amidst snow and ice to get prepared for the spring. At home the same rule must apply. We are sharing the job with them and we must share it on as nearly equal basis as possible.

Our highways must be kept clear of snow. The war has made some of our great highways nearly as important as some of our major railroad systems. The coal crisis of a few weeks ago impressed the necessity of open trunk highways in the winter. Our steamboats do not stop crossing the ocean in the winter months and our capillary systems of trans-

Digitized by Google

portation feeding the ports of embarkation for these steamers must be kept open. Winter is the period of lowest railroad efficiency and yet it is the one period when we have been willing to nearly entirely lose the use of our trunk highways. This old rule of things must in the cause of necessary protection for our armies in France cease. New York State will have to waken before another winter if she can possibly justify her good volume of war contracts and also her admirable system of roads which are equally good in winter as in summer if the snow is removed.

The State of Connecticut, which has received a liberal share of war contracts, has set an example to the nation in the work of keeping its main highways cleared of snow, and although not on any of the war truck routes to seaport and not specially requested to do anything, the State from its own internal initiative performed a wonderful work. It was able to keep the flow of munitions from factory to seaport moving steadily in spite of railroad congestion and exceptional weather.

New York State has in the Syracuse zone of 61 miles on the main Buffalo-Albany highway six bridges which are condemned so far as carrying maximum load. These bridges are permitted to carry only 2.5 tons, and the war trucks, instead of carrying their 5-ton load of merchandise to seaport, were compelled to carry 2 tons. Apparently there were no available appropriations to repair these bridges and yet nothing has been done as a war emergency measure to take care of this. We would scarcely feel proud of our army in France were our trucks there to be carrying only a fraction of their useful load because bridges were not strong enough to carry them with their full load.

Sixty War Trucks Leave Factories Daily

At present approximately sixty motor trucks per day are leaving truck factories under the Quartermaster's direction for seaport. These are being dispatched in truck companies of thirty trucks to the company. These companies are divided into three sections of ten trucks each, with a distance of approximately 1000 ft. between sections when traveling. The trucks in a section run about 100 ft. apart. Up to the present time eight of these truck companies have come over the Detroit-seaport route and all told about 400 trucks for war purposes have been driven overland. Were these shipped on railroad freight cars approximately 200 freight cars would be required and the length of time required for the shipment would be greater than what has been required in these overland drives.

The overland drives have had the advantage of training the men in the work. Each driver makes two trips from the factory to seaport. Previous to leaving the factory on the first trip he is given a short educational course in the factory, where he not only becomes familiar with the mechanics of the truck and repair work, but also is given instruction in driving the truck.

Great improvement has been made in time schedules since the first truck companies left Detroit in December. On the first trip eighteen days were required for the 570 miles. This has been cut in half and on every successive trip the daily average is being lengthened.

Some idea of the difficulties the trucks have encountered by way of snow is shown by the figures. One truck company leaving Buffalo was able to make only 6 miles in one day leaving that city. On another day 15 miles were covered, on a third day 16 miles. When roads from which the snow was removed were encountered the daily mileage rose to 95. The mileage on the last day reaching seaport was 104. The Detroit companies have found that it is possible to average pretty close to 90 miles a day, which should take the trucks from that city to seaport in a little over 6 days.

England's Example of Snow Removal

The problem of removing the snow from highways is not new, in fact nearly a century ago England gave an example of snow removal work. In the region of Sheffield, a large manufacturing city in the North, the great English snowstorm of December 26, 1836, presented a new problem of traffic. The snow did not hold up traffic at that time and the mail stage coaches were operated on schedule. There were drifts 4 to 8 ft. deep which were shoveled through by soldiers in order to keep the highways open. Bus routes running over heights at 1000 ft. above sea level were kept open.

Still a further reason why snow removal must be given more attention and increased is the development of the public rural express company, a recent example of which is the activity in the State of Maryland. These express companies are needed as much in winter time as in summer. At present the different rural express companies of Maryland have a schedule of 1574 miles covered on a regular time table. Of this distance only 300 miles is over the improved highway system of the state. In other words, this would indicate that the snow removal work will have to be extended in many states beyond main trunk lines. At present the Bureau of Markets is undertaking an investigation of rural express systems, with the object of discovering what should be a reasonable cost for such service in different sections in order to keep these companies in healthy condition. Such investigations are being made in western New York; in the zone of New York City; in the Philadelphia zone; the Detroit zone, and in Connecticut and Ohio.

The added flexibility to our food supply is well emphasized in connection with these systems. In the rural express routes out of Baltimore, anywhere from 25 to 40 gal. of milk are being brought from farmers who live 6½ to 7 miles from railroad lines, and which milk would not reach the population centers were it not for the express system.

An example of how time is conserved was shown by a farmer 12 miles out of Washington, who required four horses to draw his 3-ton load to the city. The horses were traveling by actual time study at 2 miles per hour. With a motor truck this speed is increased in actual service to 12 miles per hour. The development of rural express lines is certain to emphasize the demand for snow removal.

Traction on Bad Roads or Land*

Comparison of Wheel and Chain-Track Methods of Drive—Braking and Side-Slip Problems—Free and Locking Differentials

By L. A. Legros

THE problems involved in the design of vehicles for traveling, or for the haulage of goods, or agricultural implements, or produce over the land or bad roads, depend for their satisfactory solution upon conditions that vary widely. The worse the condition of the road or land to be traversed, the more essential it is that due account should be taken of the nature of the ground, its inequalities, its resistance to load and to those shearing forces to which its surface is subjected by tractive effort.

The methods adopted for overcoming the difficulties peculiar to such traction problems can be divided into two main classes: The one class is that in which the driving power is distributed over more than two driving wheels; the other class is that in which the tractor drives through chain tracks which reduce the insistent load. The two classes of tractor are, consequently, applicable to different conditions, and while the methods cannot be considered as competitive, the limitations of each can be best appreciated by direct comparison of their respective peculiarities and advantages.

Under the ideal conditions of traction on rails the driving power transmitted through a single pair of wheels may suffice to haul a train of many coaches for wagons. Under the less favorable conditions of ordinary roads, a single pair of driving wheels may serve to transmit the power necessary for hauling two or more trailers. Traction on the ordinary road by metal-tired wheels, however, demands in the driving wheels a large diameter and great width of tread, in order that the insistent load may be reduced to reasonable intensity. How sensitive roads are to the loads that they carry may perhaps be best realized by considering a gravel road, on which ordinary devices can, in normal conditions, be used safely; the same devices may, however, cause serious damage when the load-carrying coefficient is even slightly disturbed, as, for example, by a thaw.

Renard Road Train

Among schemes for road haulage devised with the object of reducing the load per driving wheel may be mentioned the Renard road train, consisting of six-wheeled vehicles. The central wheels of each vehicle were metal-tired driving wheels, and the end wheels were fitted with rubber tires and Ackermann steering. The leading vehicle formed the power unit, and power was transmitted to the central axles of the other vehicles of the train by an articulated shaft. Under State subsidy the system had a fair trial in France, but it has not developed to any notable extent. The attempts at multiple-axle drive have, however, indirectly, led to the development of the four-wheel drive, a system which, while less ambitious, has considerable advantages for some conditions of traction over the ordinary two-wheel drive.

The four-wheel drive may be combined with either two-wheel steering or four-wheel steering. An example of the first of these classes, schemes for which were proposed as early as 1898, was the touring car built by Spyker, of Amsterdam, in 1903, and exhibited at the Crystal Palace in 1904. M. Brillé, in a paper read before the institution, treated of an improved motor truck of the second of these classes, driving and steering through all four wheels.

The four-wheel drive vehicles of to-day have much in common with the ordinary back-axle driven truck, in type and arrangement of the engine and its accessories, such as carbureter, radiator and clutch, and also in the arrangements of gear-box, springing and brakes. Those features only will be described, therefore, in which the four-wheel driven vehicle differs from the ordinary type.

*Paper read before the Institution of Mechanical Engineers, on Friday, January 18, 1918.

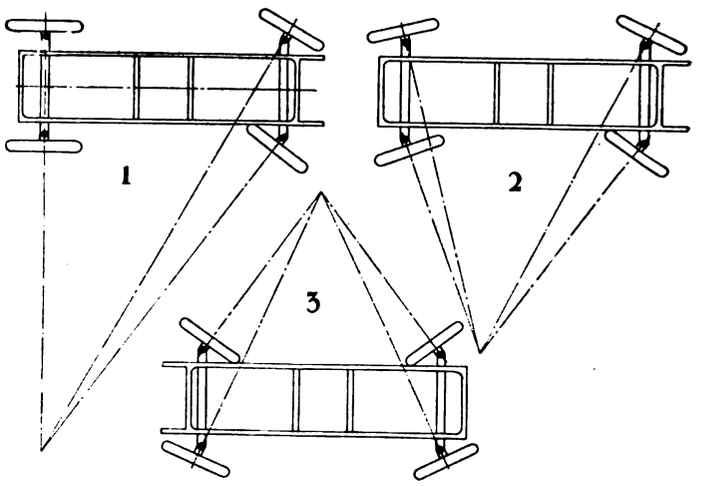

Fig. 1—Ackermann axle on front steering vehicle. Fig. 2—Non-symmetrical four-wheel steering. Fig. 3—Symmetrical four-wheel steering

Four-Wheel Steering

In the ordinary front-steering vehicle, fitted with the Ackermann axle, the design endeavors to meet the condition that in plan the axles of both front wheels shall intersect at a point on the axis of the back wheels, as shown in Fig. 1. In the four-wheel drive car with four-wheel steering the problem assumes a more general form, and the condition to be met is that the axes of all four wheels shall intersect at the same point, Fig. 2. So long as this condition is fulfilled it is not essential that the inclination of the axes to the normal shall be the same for the front and back axles; but in practice the steering is generally symmetrical, Fig. 3, and the virtual center about which the vehicle turns is situated on the normal center line. This results in a reduction of the radius of the turning circle approximately to one-half of that obtained with the same front axle and with front steering only. The vehicle has therefore much greater handiness in certain respects, but is subject to the disadvantage that if brought near a curb, and particularly a high curb, the wheels cannot be locked sufficiently to permit of taking a small turning circle in leaving. This can be a distinct disadvantage in cities, though it is to a great extent compensated for by the greater ease with which the vehicle can be manœuvred backwards.

The locking of the rear wheels restricts the space available for framing the body of the vehicle at the height of the chassis to a narrower width than with two-wheel steering. This does not affect the arrangement of a cylindrical tank or hopper-shaped body, but for the ordinary flat platform it is necessary to give greater height than in normal practice. Although the author has not found an example of the non-symmetrical steering, shown in Fig. 2, it is to be noted that conversion to this arrangement involves nothing more than altering the lengths of two levers, and that the increased width of body which could be carried direct on the chassis

Digitized by Google

might well compensate for the slight increase in the turning radius.

For driving over country roads or fields with many irregularities or obstacles the four-wheel drive has undoubted advantages, because the percentage of load available for adhesion is nearly double that of a two-wheel drive.

The application of brakes on automobile vehicles running on ordinary or bad roads involves inevitably the possibility of side-slip. It is well known that, when the coefficient of friction for lateral displacement of the tires is small, and the brakes are applied too hard on a vehicle with rear wheel brakes, side-slip will result, and the back of the vehicle will "come round" unless prevented by the skill of the driver. The extent of the slip can be reduced by releasing the brake and steering to the side toward which the back wheels are moving. When ordinary side-slip takes place on a cambered road, and the back of the vehicle is tending to approach the curb, the difficulty of arresting the movement is increased for two reasons; first, because the front wheels must be steered toward the curb, thus reducing the space available for correction of the error of movement, and secondly, because the camber of the road tends to increase the lateral velocity of the vehicle. The paths taken by the wheels respectively in an ordinary rear-wheel side-slip, on a surface which is level transversely to the direction of movement, are approximately as shown in Fig. 4, in which for the sake of clearness the front wheels are shown narrower in track than the back wheels.

Front-Wheel Slip

There is, however, another form of side-slip which is much more dreaded by the expert driver, as it is harder to check; this is front-wheel slip. On greasy asphalt, wet colite, and damp clayey roads, under normal running conditions the driver may be warned in time by the failure of the vehicle to respond to movement of the steering wheel. With this form of slip, application of the brake, resulting in the transference of some of the load from the back to the front wheels, may produce a sufficient change in the conditions to enable the path of the vehicle to be corrected. It is necessary to consider this aspect of the problem in motor vehicles that are rear-driven. As usually designed, the axle loads are approximately equal when the vehicle is stationary; but this condition is changed when the vehicle is running, for the driving torque, corresponding to the speed of the periphery of the road wheels, acts on the back axle and relieves the front axle part of the static load. Practical recognition of this fact is seen in the racing car, the evolution of which has shown a progressive increase in wheel base accompanied by forward displacement of the center of gravity of the car. A racing car of 10-ft. wheelbase with a 70-brake horse-power engine, when running at 80 m. p. h., will have a torque at the back axle of about 353 ft. lbs., but the same vehicle if climbing a hill with a gear ratio of 3.5 to 1 (reducing the speed to 23 m. p. h.) will have a torque at the back axle of 1235 ft. lbs., transferring about 1 cwt. from front to back wheel. If, on the other hand, the rear-wheel brake is applied on an ordinary vehicle, the reverse torque so set up may easily be much larger than this; and the resulting change of load conditions on the wheels may therefore increase the insistent load on the front wheels sufficiently to obtain the necessary friction between road and wheel for steering. It is obvious that front-wheel driving implies heavier loading on the front wheels, and involves greater difficulty for the driver in correcting front-wheel side-slip should it occur.

For stoppage under conditions of good road grip the four-wheel brake acting equally on all four wheels is ideal; by the use of compensating gear the braking action can be distributed equally over the four wheels, and for any given speed the car can be stopped in a much shorter distance than with two-wheel braking. When, on the other hand, the surface is greasy, a skilled driver has greater control over a vehicle braked only on the back wheels.

Four-Wheel Driving

Starley's application of the differential gear to the back axles of vehicles as a means of compensating for inequalities in diameter or in travel of the wheels requires further extension in the case of the four-wheel drive. When the vehicle is driven mechanically by a single gasoline motor, it is not only necessary to provide a differential gear on each axle, but, when these are of the ordinary bevel or spur types, a third differential gear must also be interposed between the two axles to compensate for differences in the mean diameters, and consequently in the revolutions made by the respective pairs of wheels. This introduces a further complication in the problem of driving. In the ordinary two-wheel drive if one driving wheel is held and the other is off the ground, the latter will revolve, other things being equal, at double the speed at which the pair would revolve if both were free; whereas if with the arrangement of three differentials three wheels are held and one wheel is off the ground, this wheel will revolve at four times the mean speed at which the four would revolve if free or driving normally. Conditions under which the load on any one wheel is so far reduced as to allow of slipping occur frequently on very uneven ground owing to release of spring pressure, and they also occur on ground presenting considerable fluctuations in coefficient of friction. To enable the four-wheel drive vehicle, fitted with the usual bevel or spur-wheel types of differentials, to work under these conditions it has been found necessary to fit a differential lock to the main or central differential on the longitudinal driving shaft connecting the two axle drives.

This difficulty is not so serious in vehicles fitted with electric drives, in which it is, of course, possible to fit a separate motor to each wheel. An arrangement of this kind is used in the couple-gear car.

Automatic Differential Locking Gears

The problem of power transmission when one wheel is off the ground, or has no hold, as when in a clay hole or on ice, may, however, be solved in another way. The slipping or free-running of one wheel is due to the fact that the ordinary bevel or spur differential gear is perfectly reversible. If one wheel is jacked off the ground it will revolve at twice the normal speed corresponding to the engine revolutions; and *vice versa*, if the wheel is turned round by hand the engine will make half the corresponding number of revolutions. An attempt made by Hedgeland, about 1905, to solve this problem proved partially successful; but a really practical solution appears to have been found in the worm-gear differential.

The M. and S. differential is of this type. In this arrangement each axle end carries a crown worm wheel of the same hand, each gearing into a worm pinion carried in the differential box; the two worm pinions are geared into an intermediate worm also carried in the differential box. In practice the arrangement of secondary and intermediate worms is duplicated as shown in the figure. The inclination of the teeth is selected so that the worm pinion can be driven by the crown worm wheel, but that the action is not reversible.

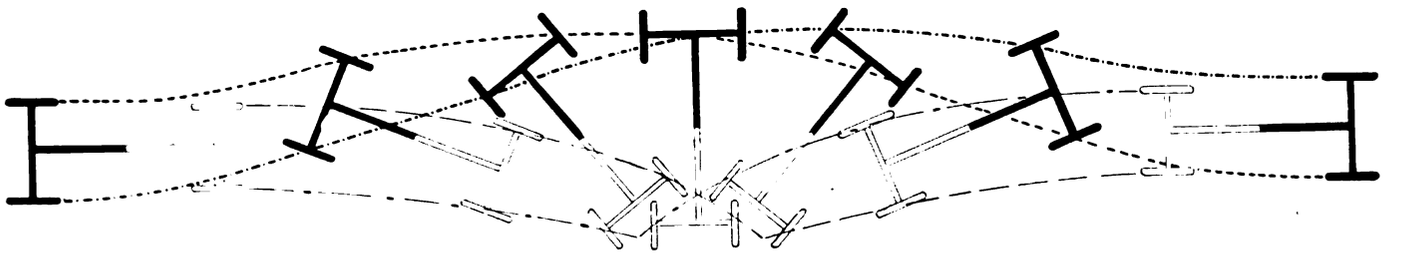

Fig. 4—Diagram of the paths followed by the four wheels of a vehicle during 180 deg. side slip

Digitized by Google

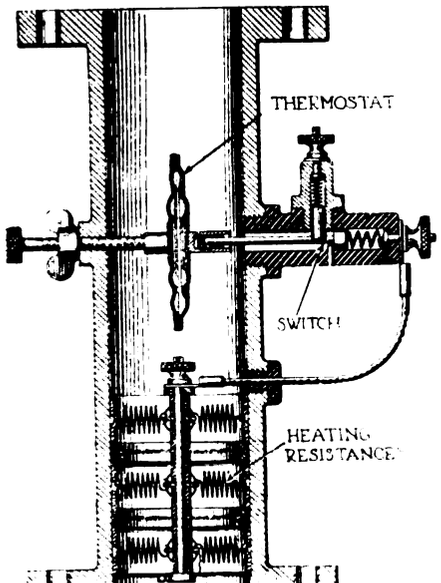
The Walter automatic differential lock is also a worm-gear differential. In this form the half-axles each carry a crown worm wheel, and as in the M. and S. gear both are of the same hand. Each crown worm wheel engages with a worm pinion carried in the differential box; these worm pinions being both of the same hand are carried on axes, the one of which is advanced in relation to the other at an angle double that of the inclination of the worm pinion thread to its axis. This arrangement eliminates the intermediate worm pinion necessary in the M. and S. gear and thus shortens the overall length.

In this country (England) the problem of the automatic differential lock has been attacked by Wolseley Motors in a different way. In one example small multiple-plate clutches are arranged in the differential box at each side so that they are acted upon by the end thrust of the gears; this end-thrust exists already in the case of bevel or mitre-gear differentials, but in the spur form of differential it is obtained by making the satellite pinions (with axes parallel to the differential axis) alternately right and left-handed worms geared together and gearing respectively with left and right-handed worm wheels, of the same tooth inclination, carried on the respective ends of the axle halves; the end thrust of these worm wheels acts on the multiple-plate clutches in the same manner as in the bevel or mitre gear differentials.

The possibility that the automatic action may not insure complete locking of the wheel or wheels is provided for in a modification of the arrangement. In this form the multiple-plate clutch sleeves carrying the thrusting wheels (whether bevel or worm) are provided with collars against which forked levers pivoted to the differential axle casing can be made to press by means of a hand lever acting through appropriate linkwork. The gear thus forms a partial lock under normal conditions and becomes a complete lock when desired.

Another form of differential locking automatically is the Dorr Miller. This gear consists of the following parts: A central driving plate, eight steel balls carried in holes in the driving plate, two groove blocks with axially-waved races for the balls, and two friction plates, one on the back of each groove block, having one face bearing on the groove block, and the other on the inside of the differential box. As soon as spinning or skidding starts, the groove block which tends to move faster also tends to move away from the central driving plates by the action of the balls in the waved grooves. This action causes the outer surfaces of the groove blocks to bind against the inside surfaces of the friction plates, which in turn tend to bind on the inside of the differential box, thereby converting the differential temporarily into a solid unit. Under normal conditions it is claimed that the rolling of the balls over the waved grooves permits perfect differential action.

It is the author's opinion that it is desirable that comparative tests of the various forms of automatic differenial lock should be made by an independent authority, such as the National Physical Laboratory.



Four-Wheel Drive, Front Steering

The F. W. D. (four-wheel drive) car of Clintonville, Wis., is a four-wheel driven car with front steering, and is fitted with hand-operated differential locks to the central differential. A dog clutch is provided for locking the central differential, and making it inoperative as a balance gear between the two axles. With the central differential locked, one or other of the clutches on the short shafts, which transmit power to the front and back wheels respectively, can be disengaged by the corresponding dog clutch. By this means the vehicle can be converted temporarily into a two-wheel back-drive or front-drive vehicle, as may be best suited to the difficulty requiring the use of the differential lock. Actually two locking gears are provided, one for each end of the differential. For continuous work as a two-wheel drive car the lock is engaged which is next to the shaft that is being used in driving so as to avoid transmitting the locking action through the teeth of the differential gear. The position in which the differentials are placed out of the center of the car is in part constructional, and in part is selected with the object of obtaining greater central ground clearance than would be possible with a central drive.

(To be continued)

Scott's Electric Fuel Heater

W. E. SCOTT, a Detroit inventor, has applied for a patent on an electric fuel heater contained in the intake manifold, which is designed to preheat the fuel before it enters the cylinder. The heating apparatus consists of a number of resistance coils and the temperature to which the fuel is heated is controlled by a thermostat.

Section through fuel heater

As will be seen from the section herewith, the heating device is a fabricated structure composed of a number of independent heating units, and the fluid passing through the device impinges against the electrically-heated coils and also against screens or baffles, which are so designed as to prevent the possibility of liquid fuel being carried through the intake unless it strikes against the heated coils. These screens or baffles aid the heated coils in breaking up the fuel and putting it into its most advantageous state for combustion.

The thermostat is located directly in the path of the heated fuel and can be set to maintain the intake gases at any prearranged temperature. It acts by cutting in and out the desired number of heating coils. The ordinary type of carbureter may be used with any fuel which is improved in its combustion properties by pre-heating.

Above the heater and directly in the path of the fuel is a thermostat of the fluid type. It is so arranged that it can be mounted in the intake without making contact with the walls. At opposite sides of the fluid container are members which transmit the motion of the diaphragms to the coil switch, thereby maintaining the desired temperature.

It is claimed that with this arrangement the main supply of fuel may be kept at atmospheric temperature and the fuel then raised to a temperature insuring complete vaporization, by the device described. It is claimed also that the use of the thermostat control makes it possible to provide a uniform mixture regardless of climatic conditions.

WE are in receipt of copies of a number of bulletins issued by the National Safety Council. These constitute an orderly presentation in loose leaf form of accident hazards and the best practices for their elimination. The subjects dealt with in the different bulletins are: Castings, Couplings, Pulleys, Gearing—Engine Guarding and Engine Stops—Oiling Devices and Oilers. Copies of these bulletins can be obtained from the headquarters of the National Safety Council, Chicago, Ill., at 10 cents each.

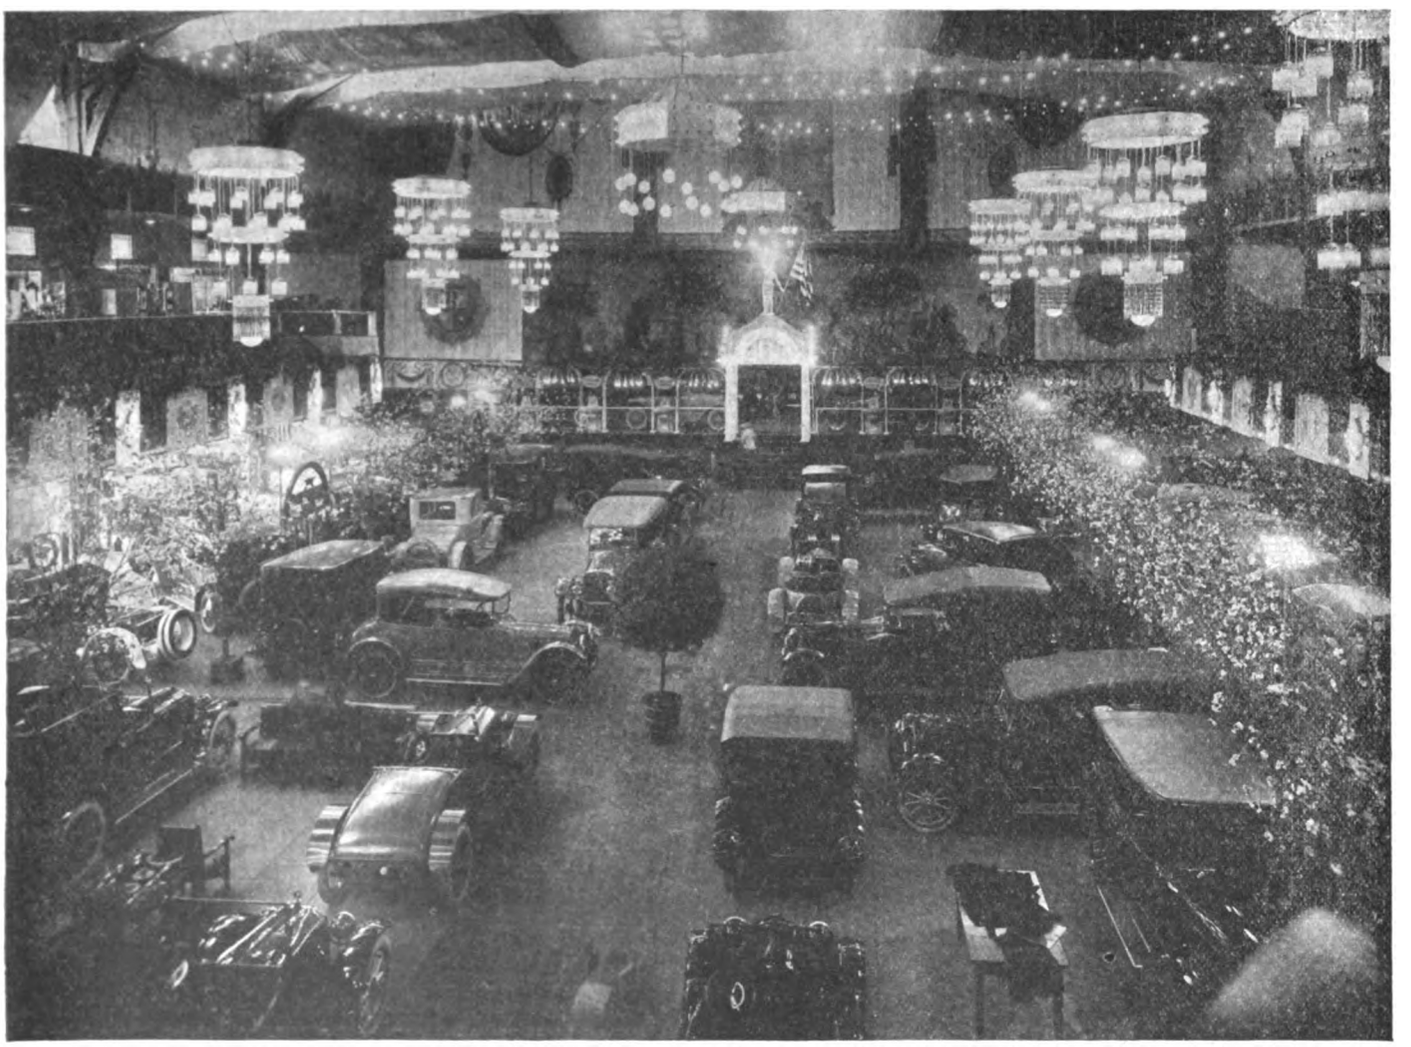
Boston Show New England Thermometer

Dealers Present in Greater Numbers—Trucks Show Big Gains—Tractors Selling Well—Connecticut Leads Territory in Car Density

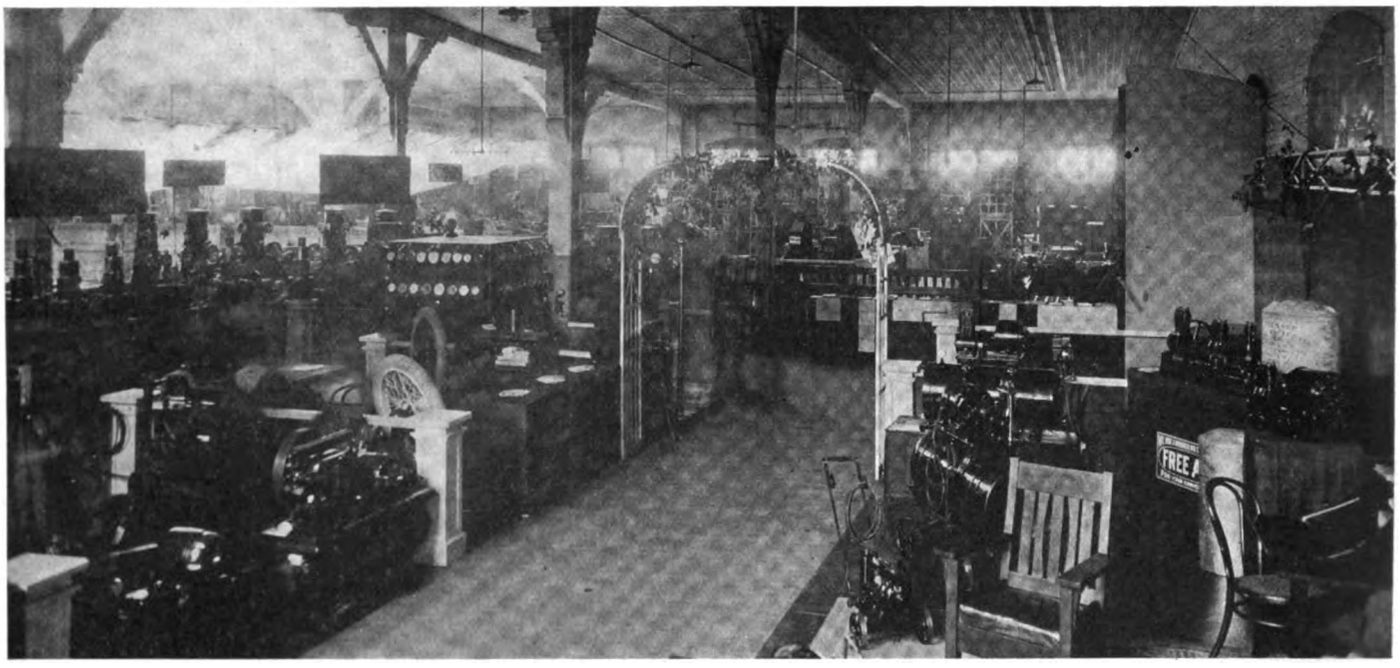
BOSTON, March 6—Notwithstanding the intense winter weather which has gripped New England since December, and also the freight embargoes which have stopped car shipments from factories to the six New England States, as well as other handicaps, the annual Boston show of automobiles and trucks gives evidence of very general optimism throughout this section of the country.



Already more dealers have registered than attended last year, a condition partly due to the excellent propaganda work which the New England distributors have been carrying on for months. The entire section has learned of the show. Posters have been in all of the railroad depots. Show cards for windows have been generously distributed for nearly 2 months, and every means resorted to to get the show injected into every corner of the territory.

This preliminary work was brought to a climax by a meeting of dealers at which over 400 attended. It was a general enthusiasm meeting, in which Alfred Reeves explained the Washington situation and LeRoy Pelletier gave a good talk on advertising in connection with show work.

Boston dealers feel duly proud of the fact that for years they have continued to exhibit motor trucks along with automobiles and accessories, and now that trucks are in such demand the dealers are justified in their consistent handling of the truck during its pioneering period.



Farm tractors are getting started in New England, and approximately 1000 were sold last year in the six States. With the perfection of the small tractor, the New England dealer will very quickly work more and more into the tractor business, just as he has handled the truck line in addition to his automobile sales.

The calendar year of 1917 was not a banner automobile year in New England, due to dealers not being able to get all of the cars they could sell. It is almost impossible to estimate accurately the number of automobiles and

The Boston show has always been a beautiful one, this view showing the peach orchard effect which was obtained in Grand Hall, which housed one section of the passenger cars

trucks sold in the year, but from reports from the State secretaries it approximates 58,239 automobiles and trucks. The number of trucks sold during the year approximates 16,000, according to registration returns.

Massachusetts continues the big leader in trucks, and out of a total of 47,592 trucks registered in all New England, Massachusetts has 26,964, Connecticut almost 12,000, Rhode Island nearly 4000, and Maine 3000. Sentiment is general around the show that motor trucks are destined to make great gains in the coming year, that while the increase in 1917 over 1916 was nearly 58 per cent, this figure will be exceeded provided the trucks can be obtained.

The complete automobile and truck census shows on Jan. 1 a motor vehicle for every 22 persons in New England, with Connecticut having the densest vehicle population of one vehicle for every 17 population, as compared with one car to every 24 persons in Massachusetts.

The registration figures for all six States, as of Jan. 1, 1917, and also Jan. 1, 1918, as compiled for the separate States, are given below.

Motor-truck registration figures published herewith give some indication of the growth of that industry.

Dope Poisoning

Dangers of Tetrachlorethane in Doping Airplane Wings—Experiences in England and Germany—U. S. A. So Far Immune—Results of Investigations Made Last Summer—British Instruction for Factory Practice—Bureau of Labor Statistics Issues Comprehensive Report

WORKER'S poison in airplane factories among those laborers engaged in putting dope on the wings created such serious difficulties in England and Germany during the early years of the war that in the spring and summer of 1917 the Bureau of Labor Statistics, Washington, D. C., conducted an investigation of the various American factories engaged in this work to learn to what extent dope poisoning or dope sickness existed in this country and has published its findings. Due to the fact that at that time our airplane factories were relatively small, few indications of dope poisoning were discovered and thanks to the attention given to this by our manufacturers, there is little of this trouble present to-day. The situation last summer was so favorable that the Bureau of Labor Statistics declares in its report by Dr. Alice Hamilton that there has been no serious dope poisoning in American factories, and no authenticated case of tetrachlorethane poisoning resulting in toxic jaundice, as the disease has been termed in England, had been reported in this country up to last summer.

The use of dopes in airplane factories is relatively safe providing proper ventilation is furnished so that the poisoning fumes are kept away from the workers. With the great increase in airplane production, which we are at present entering upon, it is more than ever essential that not only adequate ventilation, but all other arrangements necessary in connection with the use of dope should be provided.

Dope poisoning was first heard of in 1913. In that year reports were published in the German medical journals giving accounts of such cases. It appeared in a Johannisthal airplane factory in Germany, and some of the cases proved fatal. It was only a few months later until reports on dope poisoning appeared in the British medical journals. In the early part of 1915 many cases of such poisoning were recorded and during 1916 and 1917 cases were reported, although every effort was made to counteract it.

The poison in dope is not due to the cellulose compound which is the base of the product and may be either the acetate or the nitrate, but is due to the various volatile compounds in which these bases must be dissolved. These solvents in their poisonous work exert their action on the central nervous system, or on the liver, kidney, and heart muscle, or on the constituents of the blood.

The form of poisoning found in British and German shops consists of an acute degeneration of the liver with lesions in kidneys and heart muscle. England calls the disease toxic jaundice.

In the investigation in America eighteen factories were visited, these being situated in Illinois, Michigan, Ohio, Florida, New York, New Jersey, Rhode Island, and Massachusetts. Few of these employed as many as ten dopers. When these investigations were made doping rooms were passably ventilated, considering the amount of work to be

Summary of Investigations on Dope Poison

The main conclusions with regard to airplane dope by the Bureau of Statistics are:

1—In the manufacture of airplanes there is one process which may involve danger of occupational poisoning, the application to the fabric of a water-proofing, tightening mixture, known as dope. This is usually a cellulose compound, the nitrate or the acetate, dissolved in various volatile substances, which are more or less poisonous to human beings.

2—Cellulose acetate dope was formerly made with tetrachlorethane as the principal solvent. It is now made also without tetrachlorethane, dissolved in a mixture of acetone, alcohol and benzol. Cellulose nitrate dope is made with amyl acetate and acetone and usually various alcohols and benzol.

3—Dope poisoning which appeared in airplane factories in 1913 in Germany and England was caused by the presence of tetrachlorethane in the solvent. This poison is very much like chloroform but four times as powerful. Acute poisoning causes drowsiness, confusion, dizziness, sometimes loss of consciousness, or nausea and vomiting and gastric pains. Repeated exposure to the fume causes more pronounced gastrointestinal symptoms and may set up an acute degeneration of the liver with jaundice. This condition, known as toxic jaundice, was the form of dope poisoning which occurred in airplain factories in Germany and Great Britain, and in several instances proved fatal. The British have in consequence recognized such dope poisoning as an occupational disease and have substituted for military and naval airplanes a dope free from tetrachlorethane.

4—The other solvents for cellulose acetate are acetone, alcohols (wood alcohol and grain alcohol) and benzol. These are all volatile and produce, when inhaled or when spilled on the skin, some disturbance of the central nervous system, but none has the effect on the liver and other organs which is exerted by tetrachlorethane. Benzol is the most poisonous and when inhaled in large quantities it may cause death, but in the proportion used in dope solvents such severe poisoning would not be looked for. The milder forms of acute poisoning would be more probable, dizziness, headache, slight symptoms of drunkenness, with excitement or depression, and, if exposure is long continued, symptoms of slow chronic poisoning with anemia, tendency to hemorrhages, and nervous and nutritional disturbances.

5—Acetone is the least dangerous of these solvents; indeed, there is no proof that acetone as used in industry is at all harmful. Methyl alcohol (or wood alcohol) may cause serious symptoms, even when present in small amount, for some people are very susceptible to it. The symptoms of chronic poisoning are much more serious than in chronic poisoning from grain alcohol, and may involve the eyes, causing impairment or loss of sight.

6—Cellulose nitrate dopes contain as solvents amyl acetate, acetone, or other ketones, various alcohols (ethyl, methyl and amyl) and benzol. Amyl acetate has a disagreeable odor and an irritating action on eyes and throat, but so far as is known at present it is not a dangerous poison. Amyl alcohol is said to be more rapid in its effects than grain alcohol and from four to seven times as poisonous.

7—In American airplane works the dopes used until very recently have been chiefly cellulose acetate dissolved in tetrachlorethane, or cellulose nitrate dissolved in amyl acetate and acetone. As cellulose nitrate dope is inflammable and cannot be used on war planes, and as tetrachlorethane is a dangerous poison, a third variety of dope has now come into use, which is made with cellulose acetate dissolved in a mixture of acetone, alcohol, and benzol. In the future it is probable that this dope will be used for war planes, while cellulose nitrate dope will continue to be used on airplanes being manufactured for training purposes.

8—There has been no serious dope poisoning in American airplane works as yet, and no authenticated case of tetrachlorethane poisoning resulting in toxic jaundice has ever been reported in this country. This is probably to be explained by the fact that though tetrachlorethane was used in our fac-

(*Continued on page* 494)

Digitized by Google

done, but conditions then, so far as ventilation is concerned, were not comparable to the favorable conditions to-day. No doping rooms were seen so small and crowded as to suggest serious poisoning among the workers. The investigation, however, was made in warm weather, and in cold weather different conditions might rule.

The extent to which dope poisoning existed in England and Germany in December, 1913 was such that at the factory in Johannisthal four out of a force of eight workers were affected with a severe type and one died. The dope was applied to the wings by spraying as well as by painting, and the work was done in a poorly ventilated room. This dope consisted of acetate of cellulose in a solvent containing 60 per cent of tetrachlorethane. Tetrachlorethane is an organic substance which contains a high percentage of chlorine. It has come into special prominence of late due to the poisoning conditions surrounding its use unless special precaution is taken.

Reports from Germany show that two commercial dopes contained as much as 84 per cent tetrachlorethane and in experiments consisting of rubbing this into the skins of animals and exposing them to the vapors from it, there developed loss of weight, vomiting, bile and blood in the urine, death with fatty degeneration of the liver, and hemorrhages into serous and mucous surfaces and into the heart muscle. After several days of inhalation by animals these same stages were followed until death. It did not make any matter how the tetrachlorethane was administered. There was in many cases a striking resemblance to delayed chloroform poisoning. Tetrachlorethane has more than seven times the blood-dissolving power that chloroform has.

The danger from tetrachlorethane poisoning where good ventilation is not provided was shown in a German factory in 1914 in which case ten men were poisoned and one died. This person had worked only 2 months with a dope containing 40 per cent of tetrachlorethane. In another factory with fifteen dopers all but one had suffered from the poison and two died within 4 weeks. They were using dopes known as Aviatol and Emaillite.

In another German factory with eighteen cases there were two deaths, the dopes used containing 40, 60, and 84 per cent of tetrachlorethane. After these poison cases two Johannisthal plants gave up using dopes and 4 months later one of the workmen died from poisoning or toxic jaundice. Reports show that men and women who have been away for weeks or months from dope factories have developed cases. After the many German cases the use of tetrachlorethane was forbidden in German factories, but we do not know if this was literally carried out.

Great Britain has had more or less experience with poisoning from tetrachlorethane, her cases being similar to those in Germany. Great Britain's first case was in October, 1914, when a dope worker, after 11 weeks' employment, developed toxic jaundice and died. He was 36 years old. The liver was attacked and was found to be shrunken and green. An inquiry revealed ten more cases of inflammation of the liver in the same airplane factory. The ages of the men were 23 to 58 and the shortest period of exposure before illness was 3 weeks and the longest 16 weeks. Experiments were conducted on animals with the dope and these showed that the poisonous constituent was tetrachlorethane.

The second fatal case in England was a girl of 19 who began work in August, developed jaundice in December, and died Jan. 2. She died with all the symptoms of acute yellow atrophy of the liver. Another girl of 17 years after working 4 months developed a similar case. The third girl, 34 years of age, working through the fall months, developed sickness in December and died early in January. Another case was that of a man 60 years of age reported early in 1916 who died 13 days after consulting the doctor. He had worked barely 3 weeks and began complaining of diarrhea, vomiting and great prostration.

In England in February, 1916, it was known that up to that time forty-three cases of poisoning had occurred followed by seven deaths, five of which were women. Three deaths occurred among tapers.

In the investigation in America some work was conducted by the New York State Industrial Commission in the early part of 1917. Eight factories in New York State were visited, three of which were very small, and the other five employing five, six, seven, twelve and forty-five dopers. An examination of the health was made of fifty-two dopers and it was noted that some disturbance of health was present in thirty-five of these. In some it was very slight, such as a slight anemia, or yellowing of the skin, or reddening of the eyelids. Nine of the thirty-five were so classified. The remaining twenty-six gave histories of symptoms of ill health generally relating to the central nervous system or to the gastrointestinal or urinary system as follows:

Dizziness	14	Vomiting	4
Headache	6	Intoxication attacks	2
Drowsiness	14	Loss of appetite	1
Overcome by fumes	4	Burning of the stomach	1
Semi-conscious attacks	2	Burning micturition	1
Weariness	1	Dark-colored urine	1
Nausea	12	Changes in color of urine	1

Jaundice was observed in two workers and a third gave a history of former jaundice. One of the men with jaundice had dark urine. Almost 1 month previously he was attacked with acute vertigo, syncope. He became nauseated and vomited. All the symptoms except the vertigo lasted 1 day. He suffered a similar attack a week later. On both occasions he remained home and physical examination showed a marked jaundice. This worker was using cellulose nitrate dope, which was free from tetrachlorethane.

In two of the factories tetrachlorethane was used with six men engaged in doping. In the other factory employing sixty-five dopers, nitrate dopes were used with acetone as

Summary of Investigations on Dope Poison (*Continued*)

tories, the amount of dope used was usually small, doping was not continuous, and much of it was done in the open air. Moreover, dopers were continually shifting; not many remained more than a few months in the work.

9—The enormous increase in airplane manufacture in the United States is coincident with a gradual abandonment of tetrachlorethane as a dope solvent, so that we have no reason to expect that toxic jaundice will appear among the dopers in our factories. It is quite possible, however, that there may be more or less serious poisoning from benzol and from methyl alcohol, and it may prove that the other solvents used in nitrate and acetate dopes are not as harmless as we now think them. It is only prudent to assume that such danger is present and to provide carefully for the removal of fumes from doping rooms. The British requirements for artificial ventilation and for the medical supervision of dopers—requirements framed when tetrachlorethane was the solvent used—have remained in force now that the safer dopes have been substituted.

10—American airplane works are at present in process of building or remodeling. In many instances artificial ventilation is being installed; in others only natural ventilation is provided. There is little reason to expect serious poisoning among the users of dopes in these factories, but there will be opportunity for the slow, chronic effects of long-continued exposure to large quantities of amyl acetate and smaller quantities of benzol, wood alcohol, amyl alcohol, etc., among dopers, and this should be prevented by good exhaust ventilation.

Doping should be strictly confined to one building. No other work should be carried on in the room. Dopers should be taught to avoid fumes by starting their work at the end nearest the exhaust vent and working back from there, for in this way the fumes will be continually drawn away from the air they breathe. Medical supervision, with periodic examination of the dopers, is very desirable, since these poisons are comparatively unfamiliar and much valuable information as to their effects on industrial workers could be gained by the foregoing methods.

11—In any factory where tetrachlorethane dopes are used the dopers should be protected not only by a good system of down-draft exhaust ventilation, but by shortening the hours of work, by alternation of doping with outdoor work, and by providing periodic medical examination, with authorization to the physician to suspend from work those who show premonitory symptoms of poisoning.

Digitized by Google

solvent, or mixtures of acetone and such substance as benzol, amyl acetate, fusel oil and alcohol.

The second case, less markedly jaundiced, had the following history: After one week's work with tetrachlorethane dope he was attacked with dizziness and severe nausea. Symptoms simulating alcoholic intoxication lasted 24 hr. Two weeks later while at work he was overcome for a period of 2 hr. with an attack of vertigo and sleepiness. After 3 weeks more he had a similar attack and again showed symptoms resembling acute alcoholism for about 3 hr. He had highly colored urine at all times. Physical examination showed a slight jaundice. The dope in this instance contained tetrachlorethane.

In studying these cases, it is hard to determine which is the dope solvent responsible for the various symptoms. As we have seen, the characteristic effects of tetrachlorethane are gastrointestinal disturbances and jaundice. Nervous symptoms may also occur. The characteristic effects of solvents used with nitrate of cellulose are found chiefly in the nervous system. Benzol especially may cause a rapidly developing condition resembling alcoholic intoxication. The odor of amyl acetate is nauseating to some men, and both fusel oil and methyl alcohol fumes may cause vomiting, headache, dizziness.

No evidence of serious illness was discovered among these New York workmen, and no case of typical toxic jaundice, such as is described by British and German authors.

Dr. Hamilton's experience, covering three factories in which dopes with tetrachlorethane as the solvent were being used at the moment and in which about 15 dopers were employed, did not reveal any instance of toxic jaundice. The histories related did not even indicate an early stage of this disease; rather the symptoms were those of temporary intoxication and were referable to the central nervous system. Dr. Hamilton also interviewed men who had formerly used tetrachlorethane dope, though at the time they were working with the nitrate. They described cases of poisoning in their own experience or among fellow workmen, but these two were nervous in character, never jaundice with gastric trouble.

In view of the comparative newness of tetrachlorethane in industry it may be of value to describe the symptoms experienced by these dopers who had used it, even if the type of illness from which they suffered was light. Drowsiness, especially in hot weather, was more often mentioned than any other one symptom, and it was most troublesome in the early morning, passing away as the day went on. It was also worse after a holiday, the man having to go again through the process of accustoming himself to the fumes. One doper said that he was always drowsy for a while on starting work, then it passed away, but when he quit and went out into the open air the drowsiness would come over him again. Other men said they would fall asleep as soon as they reached home.

Several men told of having been made faint by the fumes so that they could work no longer that day, but always in these cases there had been some unusual circumstance that had encouraged absorption of the fumes. The room was closed and airless, or the weather very hot and humid. One man had lain down on the floor to paint the under surface of a wing, and thus breathed in the fumes which because of their heaviness always tend to fall to the floor. In another instance described doping was being done in a greenhouse and the men

British Instruction to Avoid Dope Poisoning

THE experience with airplane dope in British factories has resulted in a series of recommendations for the control of doping processes. While these recommendations were framed to protect users of tetrachlorethane dopes, they are still used in airplane works where the use of such dopes has ceased and safer dopes substituted. The following are extracts from Form 356 issued by the factory inspection department of the British Home Office, Februry, 1916:

DOPE POISONING

1—Continued incidence of poisoning in aeroplane factories has led to the addition of the main symptom caused by tetrachlorethane—toxic jaundice—to the diseases which, if contracted in a factory, must be notified to the factory department. The occupier is required to report every such case to the district inspector and to the certifying surgeon, and the medical practitioner in attendance has also to report it to the chief inspector.

2—Not every symptom set up by tetrachlorethane, it should be observed, is reportable. The requirement is limited to the serious sign of jaundice, and in view of its unmistakable character the difficulty of compliance should be small.

3—The size of the aeroplane wings unfortunately makes it impracticable to remove the vapor completely, at the point of origin, by local exhaust which would carry it off without allowing any to pass into the air of the room. Reliance, therefore, in minimizing the noxious effect, has to be placed on dilution of the air so as to keep down the tetrachlorethane and other vapors to a nontoxic proportion. The standard needed for securing this is 30 changes of the air of the doping room per hour. Where this standard has been secured and maintained for all processes in which tetrachlorethane in dope may be used, illness, if not altogether prevented, has ceased to cause serious anxiety. On the other hand, where it has fallen short of 20 changes, toxic jaundice has not failed eventually to show itself, except in the few factories where use of dope has been so intermittent as never to have exposed the workers to a toxic dose.

4—The means of ventilation must be mechanical, preferably by volume or propeller fans with free discharge to the open air. Owing to the high specific gravity of the vapor, the fans should be fixed at the floor level, or below this level where space allows the construction of large ducts under the floor. Air inlets, of the hopper type, the total area of which should be not less than three times the discharge area of the fans, should be provided at the side of the room opposite the fans at a height of about 10 ft. above the floor level. Except, however, where the fresh air is supplied by a satisfactory plenum system, or direct from the erecting shop over a partition of sufficient height, screening the doping room from the rest of the shop, such air inlets may be unnecessary.

5—Owing to varying conditions of construction in different factories, it is impossible to standardize methods of ventilation for doping rooms, but in new works, or extension of existing plants, plans of proposed ventilating arrangements should be submitted to the inspector for dangerous trades, home office, before the work is put in hand.

6—At the commencement of the war, several cases occurred among persons employed in fabric making, erecting fittings, etc., before exhaust ventilation and separation of the process of doping from others was recognized as indispensable. These two conditions have now been secured for doping the wings, but recent experience has shown that insufficient attention has been paid in some factories to the necessity of exhaust ventilation in all processes in which tetrachlorethane dope is constantly used. This applies especially to taping—now sometimes found carried on in the general erecting shop without any precautions—to which operation the three last fatal cases have been mainly due. Notwithstanding the comparatively small amount of dope used the close application required brings the face right into the fumes. And it is the same with the fuselage and other components—struts and landing gear. One attack was traced to the doping on one occasion of especially large wings in the general erecting shop because (it was alleged) the doping room proper could not accommodate them. There was a tendency in some premises before the great development of the industry was fully realized to make the doping room too small. This should be avoided in future construction, but the risk involved by such a procedure as that described makes it incumbent on the occupier to improvise for any exceptional occasion a special exhaust system.

7—Pending the introduction of an efficient substitute for tetrachlorethane, it is most important that occupiers should (in addition to provision and maintenance of a high standard of exhaust ventilation) consider and apply as far as they can the following further suggestions for safeguarding the health of the workers, which are the outcome of experience gained in various works:

(a)—*Exclusion of other work from the doping room.*—The need for this has already been pointed out.

(b)—*Alternation of employment.*—Considerable periods of overtime or long spells in doping or taping have been noted as having preceded some of the fatal attacks. Obviously, as poisoning is a matter of dosage, and the effect of tetrachlorethane is cumulative, the object aimed at by ventilation is defeated if hours of workers are prolonged beyond that for which the ventilation has been designed. In factories where alternation of employment has been arranged, e.g., two days doping and two in other work, or one week in and one week

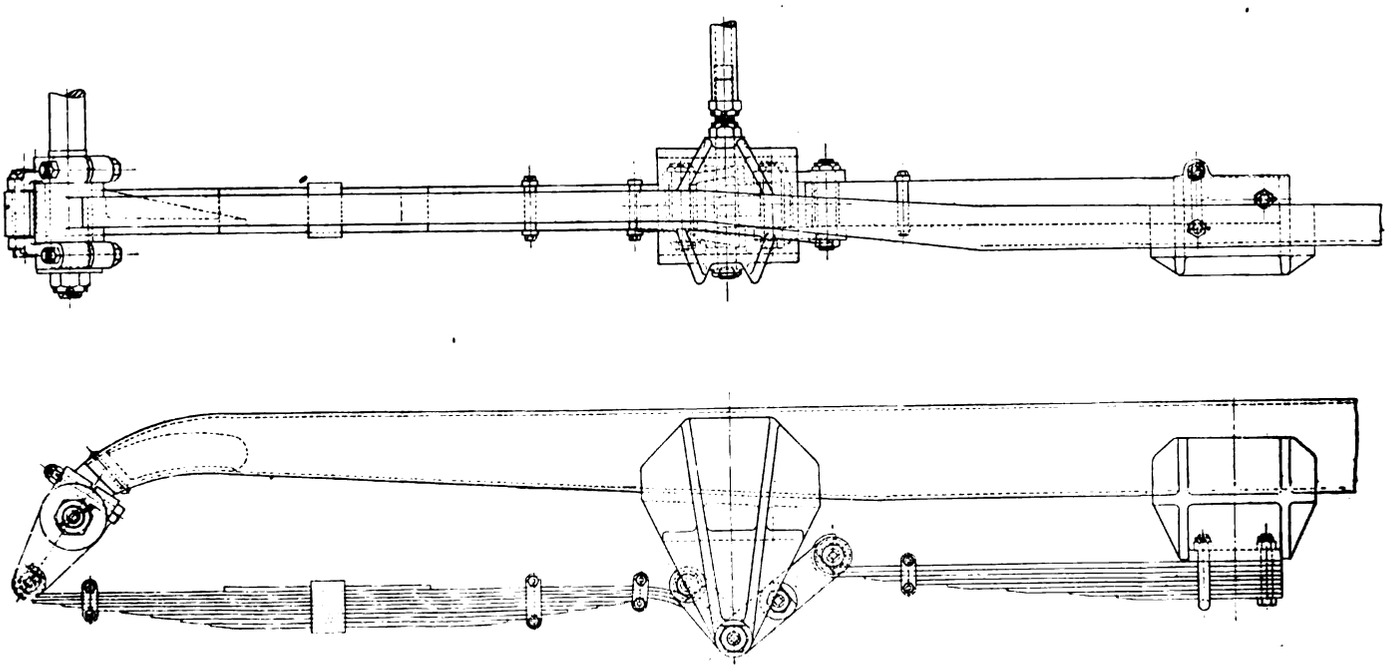
Trott Spring Suspension Absorbs Horizontal Shocks

Introduces Shock Springs Which Take Up Longitudinal Movements of Flexibly Mounted Axles



THE Trott Automobile Co. of Detroit has assembled an experimental set of its chassis springs and is sending a car equipped with them over the road from Detroit to Washington, by way of Cleveland, Akron, Pittsburgh and Baltimore. The car, which is a rebuilt White truck, will then proceed down the Atlantic Coast and through the Gulf States to Texas, where the spring suspension will be tested by the government.

The chief object which the designer of the Trott spring suspension had in view was to provide means for absorbing the horizontal component of the shock stresses on the wheels. It is estimated that a 7-in. ditch or shell hole will give a 36-in. wheel a shock with a horizontal component equal to 80 per cent of the total. It is stated that with the conventional spring suspension no attempt is made to cushion the horizontal shocks, although these may do the greatest amount of damage to the truck parts. The ordinary springs do take care of the vertical part of the shock, but it is claimed by the Trott company that nothing is done to cushion the horizontal component, although the entire weight of the truck and load enters into it.

As will be seen from the accompanying drawings, an additional quarter-elliptic spring is inserted, acting as a shock member. This spring is intended to absorb the horizontal components of the shock stresses on the rear wheels. The manner in which this is done may be clearly understood

Drawing showing layout of rear spring suspension by the Trott method

Plan and side view of Trott suspension as applied to front spring

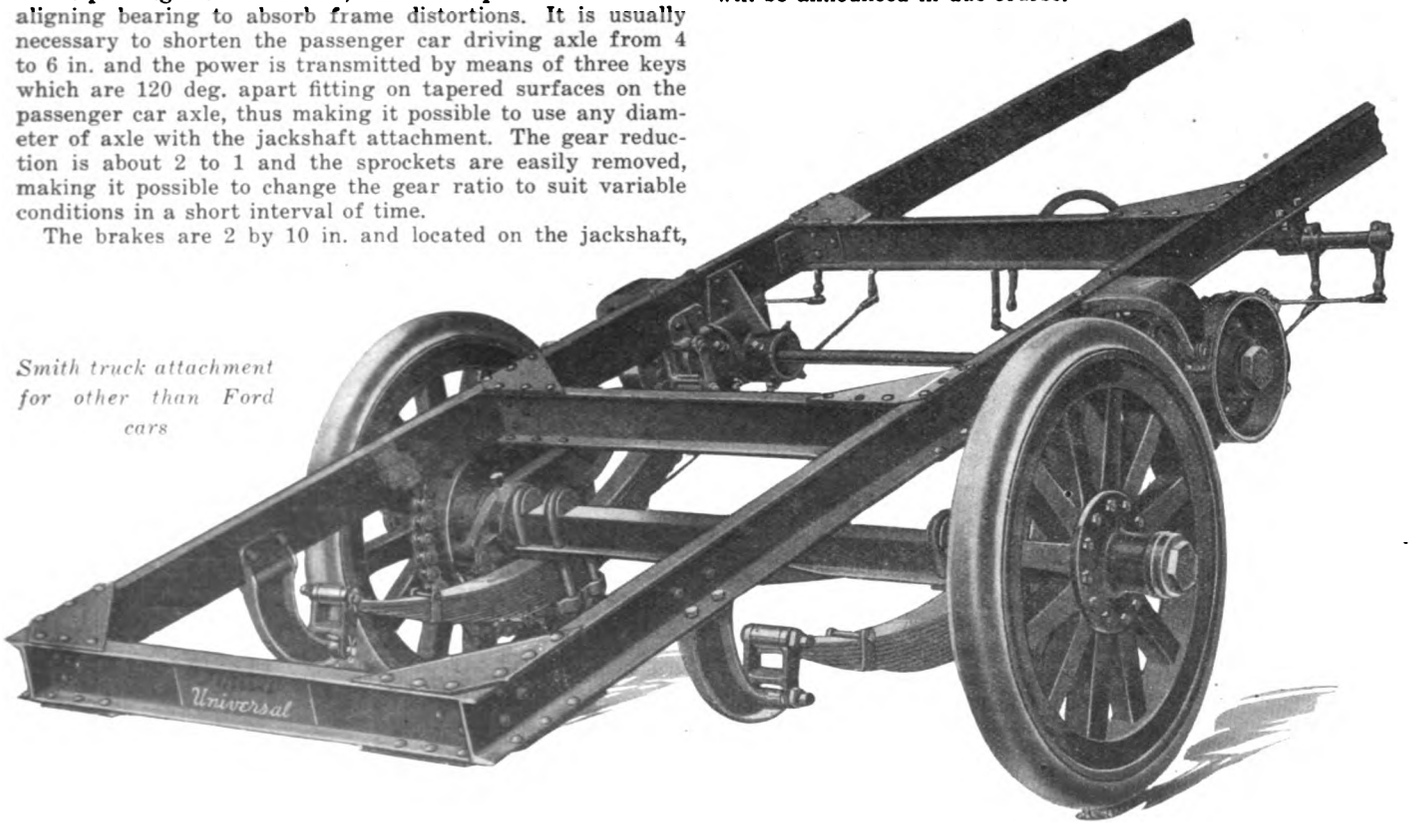
Digitized by Google

from a study of the drawings herewith. The rear axle member and the spring attached to it are capable of moving backward and forward in a direction parallel with the road. The axle and load springs are so mounted in connection with the shock springs that horizontal movements are against the action of the shock spring. When the truck is standing on a level road the shock springs may be disconnected and the axle will have no tendency to move either backward or forward. The axle, however, may be easily moved in either direction, and when such a movement takes place there will be no tendency for the frame to rise or fall. This is due to the method of pivoting both ends of the rear springs.

Thus, as far as vertical springing is concerned, there is no change in principle or construction to speak of. The shock springs normally are practically unloaded, being just under sufficient tension to give them the correct set. They are designed to operate under both large and small shocks. The shock spring becomes stronger the further back the axle is moved horizontally, so that heavy loads are compensated for by this spring. When the axle is moved back several inches as a result of horizontal shock the shock spring is said to be virtually twenty times as strong as when the axle is moving back 1 in. Thus the desired flexibility over small obstructions and the desired strength against heavy blows are both secured.

The constructon is simple, the rear end of the vertical load spring being shackled and the front end being connected with a bell crank lever. When the rear wheels strike an obstruction tending to move back the rear axle the bell crank is pulled back with the spring and axle, and it in turn depresses the quarter-elliptic shock spring, which absorbs the horizontal stress. At the front axle the same principle of construction is used as in the rear. The front axle connections do not interfere with the cross steering as used on commercial vehicles. The rear axle horizontal movement is taken care of by a longer slip universal joint on the rear axle.

By careful construction of brake centers it is also possible to get satisfactory brake action through a very low-priced linkage. In order to hold the axles horizontal regardless of their movement, cross shafts are employed which hold the springs on both sides of the truck in alignment, so that deflection of the springs on both sides is equal. Thus, when one wheel strikes an inequality the shock spring on the other side also does its part in relieving the blow. This eliminates one-sided strains on the chassis frame.



Truck Attachments for Other Than Ford Cars

THE Smith Motor Truck Corp. has brought out a universal Smith Form-A-Truck attachment of 1 and 2 tons capacity which is adaptable to practically every make of chassis except the Ford, for which a standard attachment is made. The 1-ton attachment is recommended for all chassis having engines of less than 260 cu. in. capacity and the 2-ton for all of those having engines larger than this.

The frame is made from 4-in. channel steel, reinforced by a cross member with heavy gusset plates. It is 13 ft. 6 in. long and when attached increases the wheelbase of the car 25 in. This length also provides a loading space of from 9 to 12 ft. back of the seat, depending upon the style of body and the design of car used.

The drive is through adjustable radius rods and not through the springs, which are slung under the dead rear axle. The jackshaft hanger is attached to the frame and to the housing of the passenger car rear axle, which incorporates in it a self aligning bearing to absorb frame distortions. It is usually necessary to shorten the passenger car driving axle from 4 to 6 in. and the power is transmitted by means of three keys which are 120 deg. apart fitting on tapered surfaces on the passenger car axle, thus making it possible to use any diameter of axle with the jackshaft attachment. The gear reduction is about 2 to 1 and the sprockets are easily removed, making it possible to change the gear ratio to suit variable conditions in a short interval of time.

The brakes are 2 by 10 in. and located on the jackshaft, giving ample braking power. The entire attachment is designed so that it can be mounted on a passenger car chassis without any mechanical difficulty. The 1-ton attachment sells for $400 and the 2-ton for $500 f.o.b. Chicago.

Smith truck attachment for other than Ford cars

Encouraging Use of Coal Gas

DURING the past year, since gasoline has become unavoidable for private cars in England, considerable use has been made of coal gas for motor vehicles of all kinds, from omnibuses to motorcycles. To encourage the development of this use the Automobile Association Executive Committee is now offering a prize of £1000 for the best invention which will enable coal gas to be used with advantage as a propellant of motor cars and motorcycles. A small subcommittee has been formed to prepare the conditions, which will be announced in due course.

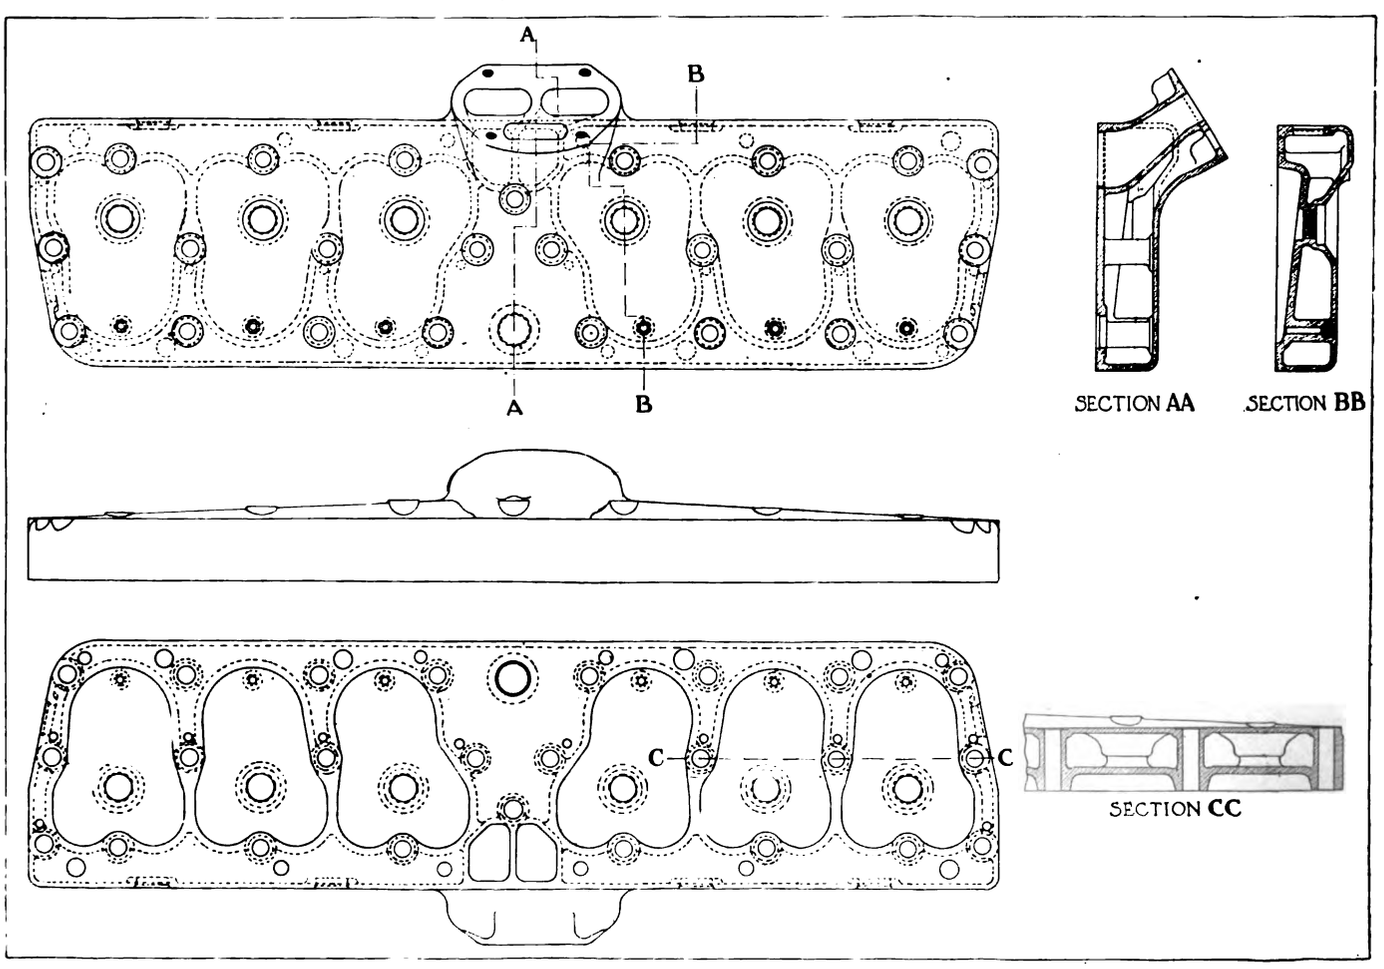
Early Difficulties with Detachable Heads Now Overcome

Proper Water Distribution and Tight Gaskets Are Chief Requirements—Plugs Must Be Kept Cool

By J. Edward Schipper



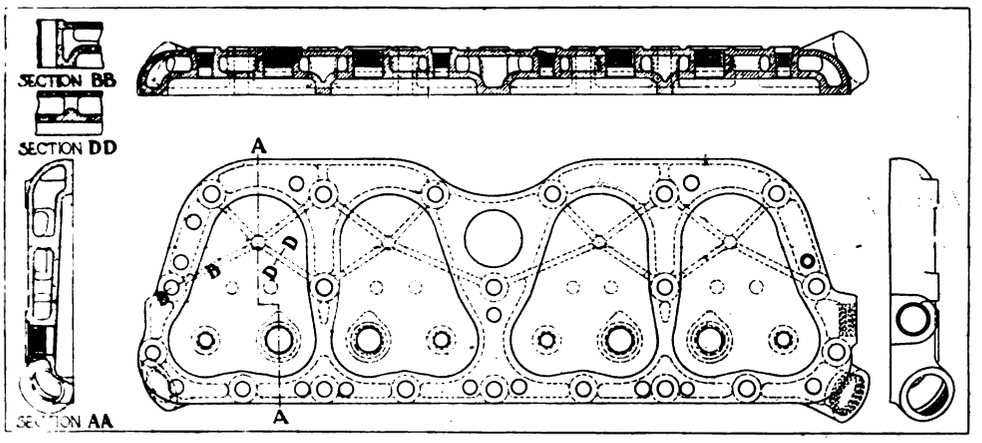
EARLY difficulties with the detachable head have been eliminated to such an extent that there is no indication of any check in the marked tendency toward this construction. Some interesting problems have had to be solved in this connection, and some of the sectional drawings given herewith show the solutions arrived at.

The water around the plugs should be given primary consideration. When this is done the detachable head engine becomes one of the best types that can be designed as far as spark plug life is concerned. The reason for this is, of course, that the water can be brought much closer to the plug than it can be where the spark plugs are screwed into the valve covers.

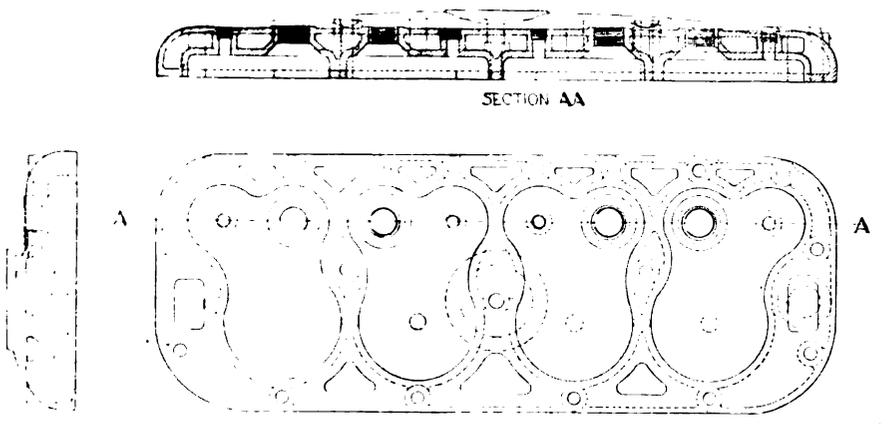
Many manufacturers on first taking up the detachable head design had the idea that large water passages were necessary between the cylinder and the head. It has been found, however, that the water circulation works out very well with smaller openings, provided they are properly distributed. The objection to large water passages is that they make it quite difficult to prevent water leakage into the cylinder.

Another point is that steam pockets have to be avoided, to which end the water outlet must be located at the highest point of the head. There is an advantage in having the water outlet near the valves, as at this point the water is hottest, and this tends to keep down the formation of steam above the cylinders.

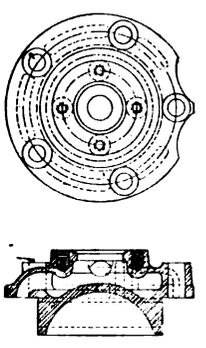
On the Hercules design a different spark plug location has been decided upon from that shown in the drawing. The spark plug is no longer located in the water jacketed head, but is in the port over the intake valve.



Detachable head employed on the Packard Twin-Six engine, showing water passages



Digitized by Google



Right—Detail drawing of the detachable head on the Cadillac eight-cylinder engine

Below, right—The Hercules Motor Mfg. Co. employs an independent head for each cylinder

Below, left—Detachable head casting employed by the Wisconsin company showing location of spark plugs and studs, together with water jacket

It is the opinion of the Hercules company that the plugs should be in the head, with the water circulating all the way around the boss into which the stem of the spark plug screws. This idea will be incorporated in the new Hercules design.

The early difficulties with detachable heads were by no means all in connection with the cooling system. One of the points which had to be cleared up was the proper method of installing studs. If there was insufficient metal around the studs the head would often be thrown out of shape, with the result that the gaskets would leak or other trouble result. In case the studs were placed too near the valves, the valve seats would become distorted by the tension on them, with the result that it was difficult to keep the valves tight. By careful watching the water space stud location and the amount of metal around the studs so as to insure that the stresses contingent upon tightening the studs will be properly distributed, a successful detachable head design is secured. Furthermore, an advantage accrues from the close approach to the ideal or hemispherical form of combustion chamber. This means that the wall area, as compared with combustion chamber volume, is a minimum, which tends toward increased thermal efficiency by reducing jacket losses.

From a manufacturing standpoint, a well designed detachable head offers an attractive proposition. In the first place, it results in an open-ended cylinder which is far easier to handle than a closed type, besides being easier to cast. It is also possible to machine the combustion chambers all over and to secure greater accuracy in combustion chamber volume.

Fluxes for Melting Aluminum Scrap

THE fluxes commonly used in melting aluminum scrap, says the *Brass World*, are fluorspar, cryolite, and salt. An excellent way of utilizing such material when a part of the scrap is small and not clean is first to melt a bath of aluminum, using solid material, and to allow it to reach a temperature of approximately 850 deg. C., then add the sweepings, etc., in such quantity that the bath will absorb them without losing its liquidity. The bath is then reheated and more scrap charged, the process of charging and reheating being alternated until the crucible is as full of metal as desired. The metal will most likely be pasty, and a small piece of fused zinc chloride is added and the bath well stirred. The resulting action will free the mixed oxides, and the metal will assume its natural fluidity. The crucible should be immediately emptied of aluminum before any reaction can occur between the metallic aluminum and the heated oxide on the one hand and the oxygen and nitrogen of the atmosphere on the other, as such reaction will consume metallic aluminum and greatly reduce the percentage recovered.

—

IT is said to be the intention of the British Air Board to stimulate output of aircraft engines by reducing the number of standard types to not more than four. At the same time care will be taken that the march of improvement will not be unduly obstructed by overemphasis of the importance of output rate. The Royal Aircraft factory is to be devoted exclusively to experimental work, but such work is not to be confined to this one establishment, as it is considered all important that several totally independent centers of thought should be at work on the improvement of aircraft.

—

FROM the Engineering Experiment Station, University of Illinois, copies have been received of two bulletins issued by the Station and covering experimental work done by it. One is entitled "Tests of Oxy-acetylene Welded Joints in Steel Plates" and the other "The Collapse of Short, Thin Tubes."

The Most Economical Size of Tractor*

An Analysis of Costs of Power Plowing with Tractors of Different Sizes, Taking Account of Labor Cost, Cost of Fuel and Repairs, Depreciation and Interest on Investment

By E. Goldberger
Efficiency Engineer, Packard Motor Car Co., formerly Assistant Chief Engineer, Holt Mfg. Co.

A COUPLE of years ago a study of the cost of plowing with tractors would not have been of any practical value, since the conclusions, even though they might have been drawn in the most logical way, would have been based upon theoretical assumptions, hence the conclusions too would have been theoretical.

During the last few years the line of tractors has been extended, till now we have on the market tractors of practically any size between 10 to 130 hp. From their performance and prices and from the requirements on the farm and the manufacturing problems—all known factors—it is possible not only to draw correct conclusions regarding present conditions, but also to anticipate future developments, which, from a business standpoint, are more important.

Many students of this problem will undoubtedly say conditions on the farms are so different as to the quality of soil, size of farm, kind of crop and hundreds of other things that, considering everything that enters into the problem, a general and intelligent solution of it is precluded, while without taking everything into consideration the solution cannot be correct. That is as it appeared to me a couple of years ago, but I have changed my mind in the meantime.

One way of attacking the problem is by a "national referendum" *i.e.*, by asking every tractor owner the size of tractor and farm he has, perhaps also the size of tractor he thinks would suit him better, and draw the conclusion according to the law of averages. The Department of Agriculture has published in book form the results of such an investigation directed by A. P. Yerkes, and it is of interest to note that although following different methods, the results of the survey agree with the conclusions which follow the thought of this study.

In the following, I shall consider three sizes of tractor that would be built along exactly the same standards of quality, design and workmanship:

A—Capable of pulling two 14-in. plows, 6 in. deep, in average soil, at a speed of 2½ m.p.h. This would require about 9 hp. on the drawbar.

B—Same quality tractor, of double size, pulling four 14-in. plows, 6 in. deep in the same soil, 2½ m.p.h. speed. Drawbar of 18 hp.

C—Twice as strong as B, pulling eight 14-in. plows, 6 in. deep in the same soil. Drawbar 26 hp.

Price

Since there is to-day no doubt in the mind of anybody familiar with the tractor problems that really successful tractors are and have to be built according to the standards of quality adopted by the truck manufacturers and not those of the country blacksmiths, I shall estimate the prices as follows:

Tractor A, $600; tractor B, $1,500; tractor C, $3,600. The price for tractor A if the design, material and workmanship be first class, cannot be reached unless quantity-production methods are adopted. For 100 per cent increase in size, the price increases 150 per cent in the above estimates, since I make the preliminary assumption that with the size of the tractor increasing, the demand might decrease and the manufacturing methods to be adopted become more expensive.

I shall not consider the cost of plows and other equipment, since for a comparative study of the cost of plowing with different sizes of tractors it matters very little.

A two- and a four-bottom tractor and plow can easily be operated by one man, while for an eight-bottom tractor two men are necessary, not for lifting and lowering the bottoms, which can be done automatically, but for cleaning and unclogging the plows, which would mean stopping the machine often if it were expected to be done by the man steering the tractor.

The expense for operator would therefore come to 30 cents per hour for the two- and four-plow outfit and 60 cents for the eight-plow outfit.

Experience has shown that the fuel consumption of gaso-

line tractors per hp.-hour changes little or not at all with the size of motor, provided all are built according to the same standards and are run at the same percentage of load. In our case the cost for fuel (and oil, etc.) should be for tractor A, 25 cents per hour; tractor B, 50 cents per hour, and for tractor C, $1 per hour.

Depreciation

One often hears the statement that a tractor will last 5 or 6 years. Such a statement is fundamentally wrong. There are two reasons why a tractor, or any machine in general, depreciates; first, wear and tear of the machine, a factor which is altogether independent of its age, the only thing affecting it being the actual working hours; and, second, obsolescence, which on the contrary, depends upon the age of the machine and not upon the working hours. The last factor is more important than the first in automobiles or any products subject to change of style, but, with utility products, it has little importance, unless a new invention changes fundamentally the existing conditions. Yet, even among automobiles, the Ford car, model T, has not become obsolete after 10 years of use, and I know of American tractor manufacturers who have not improved their tractors materially since 1911-12 and are now selling more tractors of the same type in a month than they made all told up to 1915, while some of the machines they sold in 1912 are still going strong. Therefore, it is appropriate to base the allowance for depreciation upon the total actual working hours of a tractor, provided it be of progressive design, and not upon total life. This should apply satisfactorily to horses or any draft animals whose average life is nearly constant whether they work or not. It is a conservative estimate to say that tractors of modern design of any size have a useful life of about 4500 hours of plowing, which would give a tractor, plowing 10 hr. a day, a life of 5 years. Should the tractor plow only 45 days per year its life would figure out at 10 years, provided no other work is done. This estimate is safe since 90 per cent of its value has already been figured in the item for wear and tear, and part of the remaining 20 per cent can easily be recovered from the sale of its high-grade material as junk.

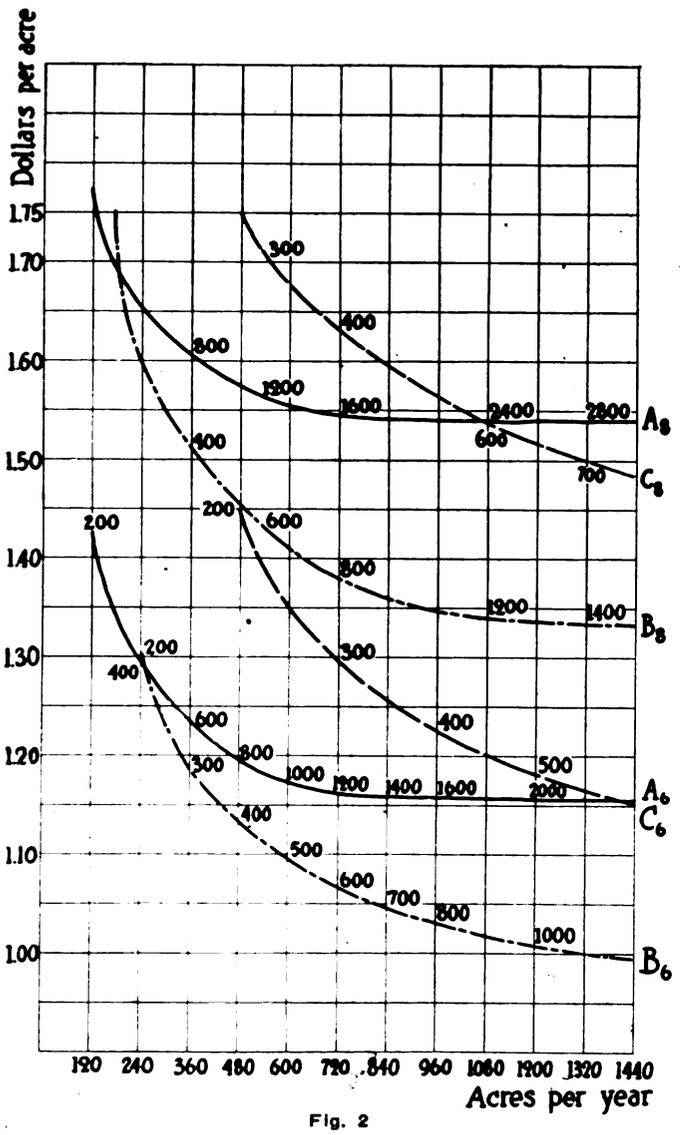

Fig. 2

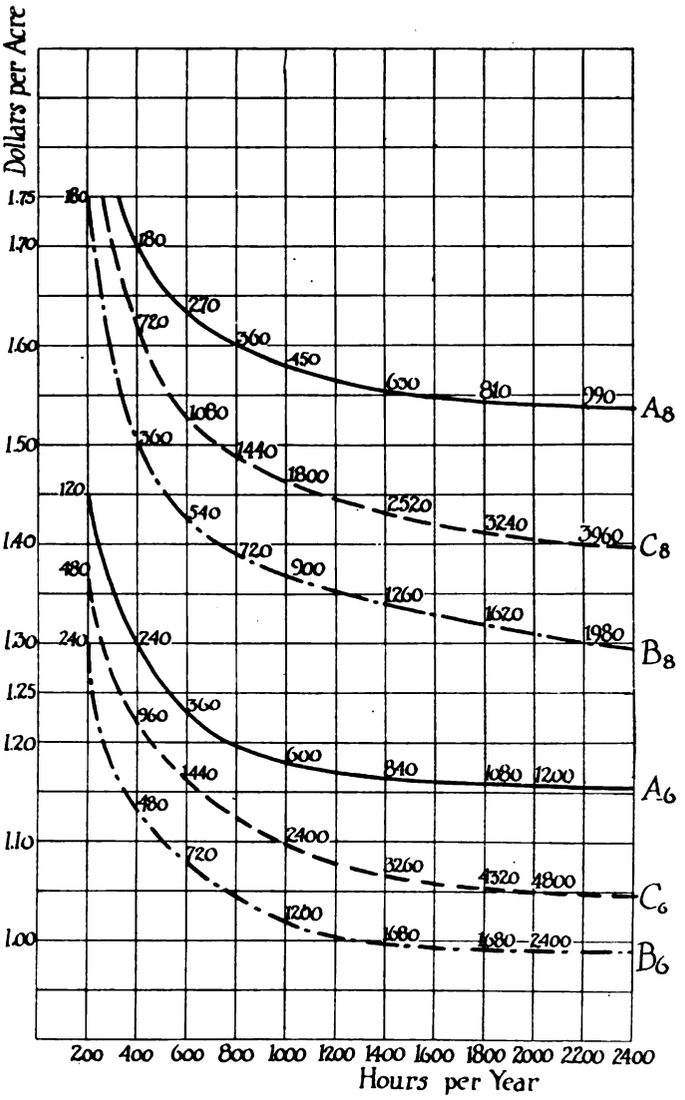

Fig. 3

The amount of depreciation per plowing-hour figures out to

$$\frac{600}{4500} = \$0.13 \text{ for tractor A.}$$

$$\frac{1500}{4500} = \$0.33 \text{ for tractor B.}$$

$$\frac{3600}{4500} = \$0.80 \text{ for tractor C.}$$

Repairs and Interest

These two factors are considered together and estimated at 6 per cent per year on the initial price of the tractor. Since the value of the tractor decreases constantly, the interest on it also decreases. Suppose the life of the tracor to be 6 years, then the interest during the first year will be 6 per cent on the price paid; the following year it will be 6 per cent on the actual value of the tractor, or 5 per cent on the initial price, and so on. The allowance for interest and repairs being 6 per cent per year on the initial price, it results that no repair allowance is made for the first year, 1 per cent of the initial value for the second year, 2 per cent for the third year and so on, an estimate which conforms to conditions encountered with tractors of modern design.

Suppose we calculate every one of these items for each of

Digitized by Google

the three sizes of tractors chosen, for different numbers of plowing hours per year. Graph 1 is based on these figures, the horizontal scale representing the number of plowing hours per year and the vertical scale, the cost of plowing per hour. Curves A, B and C correspond to the machines mentioned.

Graph 1 does not give directly the comparative costs of plowing with the different sizes of tractors, but is used for making graphs 2 and 3. Graph 3 gives the cost in dollars per acre, varying with the hours of plowing. Tractors A, B, and C are supposed to pull 2, 4 and 8 bottoms, 14 in. wide and 6 in. deep, at a speed of 2.5 m.p.h. It is assumed that the tractors will plow only 85 per cent of the time they are in the field, 15 per cent being allowed for turning the headlands, oiling, trouble, etc. The area actually plowed per hour then figures out to 0.6, 1.2 and 2.4 acres respectively. The small figures along the curves give the number of acres per year the respective tractor will plow.

With graph 2 as a basis, graph 3 has been drawn, and this gives the information we are after. We read the area to be plowed in a year on the horizontal axis, follow the vertical through this point, until it intersects with the curve representing the A, B, or C tractor, and then pass horizontally to the left where we read on the vertical axis the cost of plowing per acre. The figures along the curves represent the number of hours the tractor will have to work in order to perform the work expected. Recalling that A, B and C represent tractors plowing 8 in. deep, let us now consider the significance of graph 3.

If we have to plow less than 250 acres per year and not deeper than 6 in., the tractor with 9db-hp. plows the cheapest, while for anything above this amount of plowing the 4-plow tractor with about 18 db-hp. is cheapest in the end. Even for farms so large that one 4-plow tractor is too small, it pays better to have two 4-plow tractors than one 8-plow tractor. The advantage of having two smaller units instead of one large one, due to the flexibility and reduced chance of complete tie-ups, due to breakdown, etc., is not considered at all in the chart.

The chart shows much more than this. It shows how much cheaper the plowing comes if there be much of it, or, in other words, how expensive it is to be poor. There are, however, two ways enabling the small farmer to meet the competition of the big one, without having to buy his neighbor's land. They consist in plowing deeper and in plowing early and quick. To enable him to do this he will decide on a 4-plow tractor rather than on the smaller size. In fact, we find from the upper curves that represent the cost for plowing 8 in. deep that for over 180 acres of plowing per year the 4-plow tractor is the cheapest. While for 240 acres of plowing per year the 4-plow tractor figures only a little cheaper in dollars and cents, it has the advantage that it performs the work in about 30 days instead of 60, as is necessary with the smaller one.

Now, there are two ways of making a tractor intended to pull 4 bottoms, 6 in. deep, plow 8 in. deep. The first is to hitch to it 3 plow bottoms instead of 4; and the second to plow with 4 bottoms, but at lower speed, about 1.9 m.p.h., instead of 2.5 m.p.h. Every tractor should have the two speeds mentioned. The areas plowed per hour by the two methods and the costs are nearly the same. One great advantage of the first method is that we have a low-speed gear in reserve for hard spots on the land, or grades. On the other hand, with a 2-plow tractor, intended for 6 in. deep plowing, we have no other choice—if extra expense for specially narrow bottoms is to be avoided—than to run the plows 8 in. deep on low speed all the time.

Manufacturers have too long likened tractor manufacturing problems to truck problems. There are good reasons for building 4 or 5 sizes of trucks in the same plant. A 5-ton load sometimes cannot be handled by either one or two 3-ton trucks and it is not economical to run a 3-ton truck with a 1-ton load; but in plowing the load can be easily adapted to the full power of the tractor.

It is important to note that the above conclusion has been reached although the preliminary assumption was made that the 2-plow tractor would probably be the most popular type, and therefore the cheapest to manufacture. But since we have reached the conclusion that the 4-plow outfit is the most economical it is reasonable to conclude that, owing to its production in large quantities, its cost per horsepower will not be 25 per cent higher than that of the 2-plow outfit, as assumed at the start of this analysis, but perhaps even lower.

Scenes from the Flying Fields in France

THE photographs show views from the training headquarters of the American air forces in France. In the upper picture is seen a Nieuport monoplane, said to be one of the fastest scouting machines in existence, which has been loaned by the French Government to the American air service. In the lower view are shown the provisions for refilling the tanks of the flying machines.

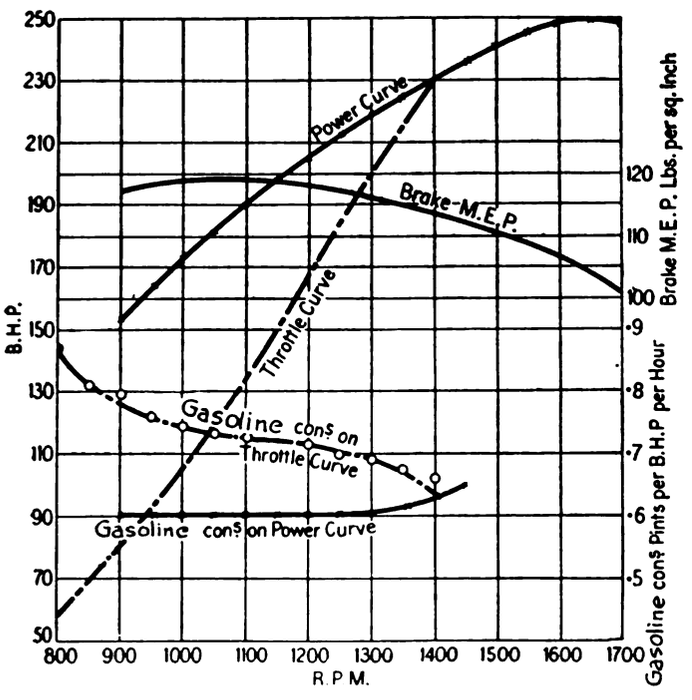
The Benz 230-Hp. Aircraft Engine

Part III

Weights of Component Parts—General Data and Dimensions — Analyses of Materials of Construction — Test Results of the Engine



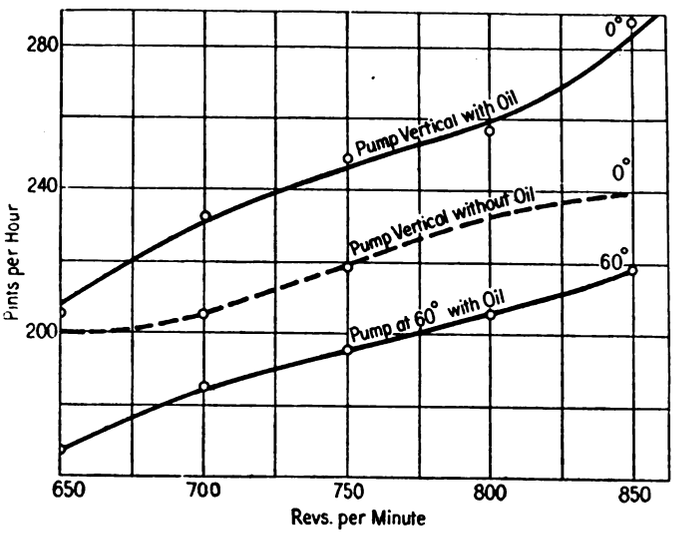
THE following data relating to the 230-hp. Benz engine were obtained from a test carried out at the Royal Aircraft Factory, and the power, throttle and consumption curves as shown resulted.

The engine, which was coupled to a Heenan and Froude water dynamometer, was run up to 1700 r.p.m., the peak of the power curve occurring at 1650 r.p.m., at which 250 hp. was developed. The maximum brake m.e.p. reached 119 lb. per sq. in. at 1100 r.p.m. The test was of one hour's duration.

R.P.M.	1400
B.H.P.	229
Gasoline consumption	150 pints
Oil consumption	4.5 pints
Water inlet temperature (average)	62° C.
Water outlet temperature (average)	71° C.
Oil temperature (maximum)	50° C. steady
Oil pressure (minimum)	28 lb. sq. in. steady

The following is a list of weights of various parts of the engine:

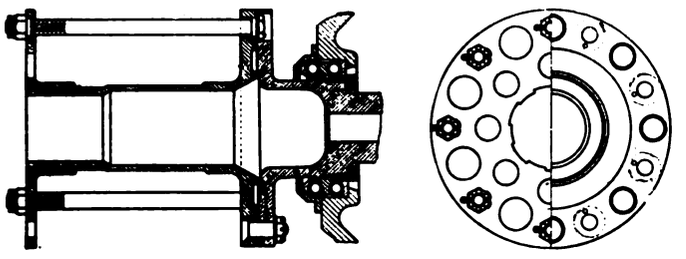
	Lb.
Cylinders, complete, including supports for rocker levers (six at 44.25 lb. each)	265.5
Pistons, complete, with rings and piston pins (six at 7.62 lb. each)	45.72
Connecting rods, complete (six at 7.13 lb. each)	42.78
Valves and springs, complete (twenty-four at 1.14 lb. each)	27.36
Tappets, push rods, and rocker levers (twelve sets at 3.2 lb. each)	38.4
Induction pipes, complete (two at 2.625 lb. each)	5.25
Carbureters, complete (two at 6.54 lb. each)	13.08
Crank chamber, top half	103.25
Crank chamber, bottom half (including cylinder studs and oil pump shaft)	110.25
Crankshaft, complete	109.25
Propeller boss, complete	19.32
Camshafts, complete, with bearing, less gear wheels (two at 8.25 lb. each)	16.5
Magnetos, complete (two at 10.75 lb. each)	21.5
Ignition wiring, complete (two at 2.12 lb. each)	4.24
Water pump, complete	8.75
Oil pump, complete	2.89
Fuel pump, complete	6.75
Exhaust manifold	15
Miscellaneous parts	7.53
Total weight of complete engine	863.32



Characteristic curves of engine

General Data and Summary

The following general data and summary are furnished by the naval and military authorities:



Number and arrangement of cylinders.	Six vertical
Bore	145 mm. (5.71 in.)
Stroke	190 mm. (7.48 in.)
Stroke/bore ratio	1.31-1
Stroke volume of one cylinder	3137.476 cu. cm. (191.386 cu. in.)
Total stroke volume of engine	18824.856 cu. cm. (1148.316 cu. in.)
Area of one piston	165.13 sq. cm. (25.59 sq. in.)

Results of tests of fuel pump

Total piston area of engine	990.78 sq. cm. (153.57 sq. in.)
Clearance volume of one cylinder	796 cu. cm. (48.66 cu. in.)
Compression ratio	4.91-1
Normal B.H.P. and speed	230 B.H.P. at 1400 r.p.m.
Piston speed	1744 ft. per min.
Brake mean effective pressure	113 lb. per sq. in. at 1400 r.p.m.; 119 lb. per sq. in. at 1100 r.p.m.
Cu. in. of stroke volume per B.H.P.	4.99
Sq. in. of piston area per B.H.P.	.667
H.P. per cu. ft of stroke volume	346.3 h.p.
H.P. per sq. ft. of piston area	215.9 h.p.
Direction of rotation of crank	R.H.T.
Direction of rotation of propeller	R.H.T.
Normal speed of propeller	Engine speed
Lubrication system	Forced to main bearings from reservoir in sump.
Brand of oil	50 per cent Vacuum Heavy and 50 per cent Sternof
Oil pressure	28 lb. normal, 50 lb. max.
Oil temperature	50° C., max.
Oil consumption per hour	4.5 pints
Oil consumption per B.H.P. hour	.02 pint
Specific gravity of oil	.9
Type of carbureter	Two Benz each feeding three cylinders (two-jet)
Mixture control	Automatic
Fuel consumption per hour	150 pints

Digitized by Google

Propeller hub construction

Fuel consumption per B.H.P. hour	.65 pint
Specific gravity of fuel	.720
Type of magneto	Two Bosch Z.H.6
Firing sequence of engine	Prop.: 1, 5, 3, 6, 2, 4
Numbering of cylinders	Prop.: 1, 2, 3, 4, 5, 6
Speed of magneto	Two-thirds engine speed
Direction of rotation of magneto, facing driving end of armature	Anti-clockwise
Magneto timing	30° E. 18 mm. on stroke
Inlet valve opens. Deg. on crank	10° E.
Inlet valve closes. Deg. on crank	55° L.
Maximum lift of inlet valve = h	11.8 mm. (.465 in.)
Diameter of inlet valve = d (smallest diameter)	Two of 52 mm.
Area of inlet valve ports = $\pi \times d \times h$	19.27 sq. cm. each
Mean gas velocity through inlet valve	124 ft. per sec.
Clearance of inlet tappet	.009 in.
Exhaust valve opens. Deg. on crank	60° E.
Exhaust valve closes. Deg. on crank	20° L.
Maximum lift of exhaust valve = h	11.25 mm. (.443 in.)
Diameter of exhaust valve ports = d (smallest diameter)	Two of 52 mm. diameter
Area of exhaust valve ports = $\pi \times d \times h$	18.37 sq. cm. each = 2.84 sq. in.
Clearance of exhaust tappet	.015 in.
Direction of rotation of revolution counter-drive, facing driving shaft on engine	Anti-clockwise
Speed of revolution counter-drive	½ E.S.
Weight of engine, complete with propeller hub, less water, fuel, and oil, and exhaust manifold	848.32 lb.
Weight per B.H.P., ditto	3.68 lb.
Weight of exhaust manifold	15 lb.
Weight of oil carried in engine	18 lb.
Jacket capacity of one cylinder	1873 c.c.
Weight of water carried in engine	30.9 lb.
Weight of radiators, less water	136 lb.
Weight of fuel per hour	135 lb.
Weight of oil per hour	5.06 lb.
Total weight of fuel and oil per hour	140.06 lb.
Gross weight of engine in running order, less fuel and oil. Cooling system at .65 lb. per B.H.P.	996 lb.
Weight per B.H.P., ditto	4.33 lb.
Gross weight of engine in running order, with fuel and oil for six hours. Tankage reckoned at 10 per cent weight of fuel and oil	1920.89 lb.
Weight per B.H.P. with fuel and oil for six hours	8.35 lb.

Analysis shows the chemical composition of the various parts to be as appended below. The analysis of gear wheel and camshaft were made on drillings taken from the cores, as these were case-hardened parts:

ANALYSIS OF MATERIAL

	Carbon %	Silicon %	Sulphur %	Phosphorus %	Manganese %	Nickel %	Chromium %

Rimco Rubber Insulated Pliers

ELECTRICIANS working on high tension distributing circuits always make use of pliers with insulated handles. This same tool is also useful in ignition work. The Rubber Insulated Metals Corp. of Plainfield, N. J., has developed a

Pliers with rubber-covered handles

new type of insulated handle plier in which the rubber covering, instead of being hard, is semi-soft. The result is that the insulation will not crack or break when the tool is dropped on a hard surface. In order to obviate breakage of the rubber covering, in some instances rubber tubes have been slipped over metal handles, but in the tool here illustrated the rubber compound is united to the metal by what is known as the Elchemco process, which is said to effect a permanent bond. These pliers, before being shipped, are subjected to a test under 10,000-volt electrical pressure.

Owing to the rubber covering of the handles the pliers are more pleasant to work with in cold weather than pliers with bare metal handles.

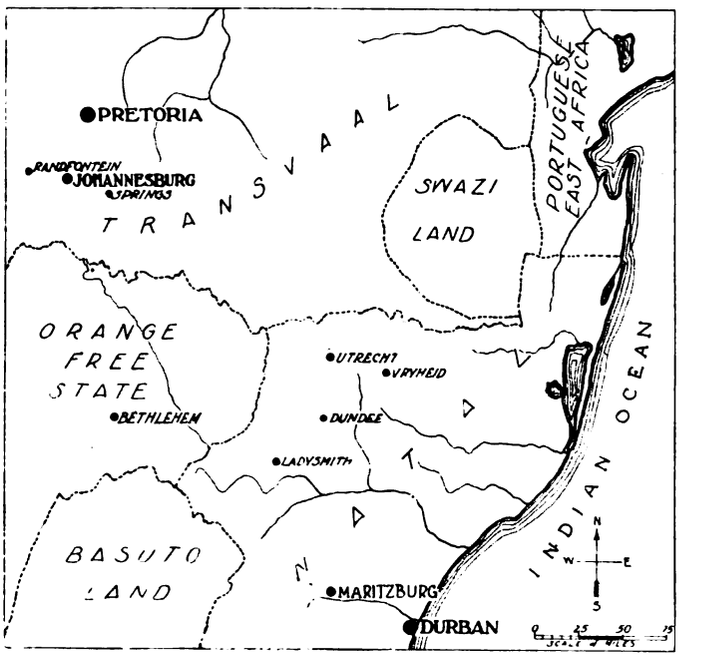
Automobile Conditions in South Africa



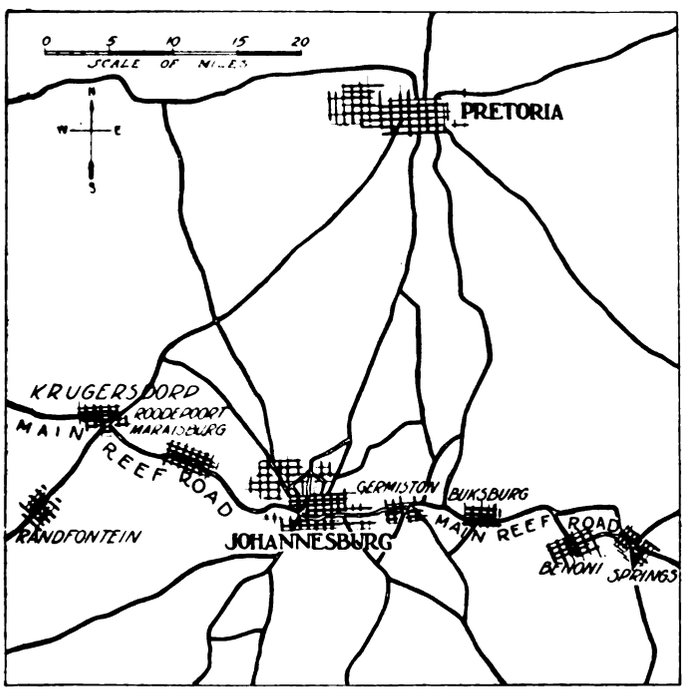
Transvaal's Mining Industry Furnishes the Chief Market in That Province—High Cost of Fuel a Hindrance to Sales — Natal a Prosperous Agricultural Country and Farmers Buying Cars

JOHANNESBURG, SOUTH AFRICA, Nov. 7.—The sale of automobiles in Johannesburg and this district is almost entirely dependent on the mining industry. The principal classes of buyers are business and professional men. This is largely due to there being little manufacturing of any description carried on in the Transvaal, which in turn is due to the absence of any source of production of raw material and also to the high cost of labor.

Conditions here are about as they have been under war conditions, excepting that during the past few months there has been an acute shortage of gasoline, and the price to-day is $4.08 per Imperial gallon. It is hoped that these conditions will soon improve, as there are several large consignments of gasoline due here. There are three suppliers of gasoline for this territory, namely, the Vacuum Oil Co. of South Africa, which is an offshoot of the Standard Oil Co.; the Texas Oil Co., and the British-American Oil Co.

Johannesburg has no definite selling season for automobiles, the sales being generally distributed more or less freely the year round, and while the sale of cars is to business and professional men, these are so largely dependent on the mining industry that sales generally respond to mining conditions.

The farming community purchases generally from August to December, this being the time they are paid for their crops, and it is during these months that the dealers endeavor to stimulate sales and introduce new models. C. Whitehead, general manager of the Johannesburg Motor Mart, reports that the used-car problem is one of the greatest troubles in that section, and that



Map of Natal and parts of adjoining provinces

one of the principal difficulties in connection with it is the ridiculous values given by dealers handling comparatively unknown makes of cars in order to introduce them. In the original sales of these cars the dealers will give any discount asked for.

The sale of automobiles in the Transvaal and in the vicinity of Johannesburg is not stimulated by good roads and touring through the country for pleasure as known in America and Europe scarcely exists. The road mostly used around Johannesburg is known as the Main Reef Road, which couples up the principal mines of Witwatersrand and is 60 miles in length. It extends as far as Springs to the east and Randfontein on the west. The surface is good and is generally well maintained. The gradients are not exceptionally heavy, so that an average four-cylinder American car, such as Studebaker or Buick, is able to make the round trip on high gear. Officials of the mining companies and merchants transacting business with the various mines are great users of this road. Perhaps the greatest inconvenience in motoring in the mining district is the high winds which prevail here, and which carry the dust from the mine sand dumps so that the road is frequently bathed in this dust.

The most popular road for motorists is that between

Digitized by Google

A view in West Street, Durban

Attractive scenery along the Umkomaas River, Natal

Johannesburg and Pretoria, 37 miles. This road is well maintained and has no heavy grades.

The longest touring trip that can be considered a popular one is from Johannesburg to Durban, which is the popular health resort for Johannesburg people. It is a 400-mile trip, and the road is good as country roads in the Transvaal go, but recently it has been badly washed away by the heavy rains. The worst feature of the road is the number of gates dividing off the various farms. There are sixty of these in the first hundred miles out of Johannesburg, and opening and closing these cut down the pleasure of the trip.

There are any number of other roads radiating from Johannesburg to outlying towns, but these do not compare with those mentioned so far as popularity is concerned. In the outside districts of the Transvaal the success or failure of crops affects the sale of automobiles very materially. Fruit farming is a small industry, but during the past few years rapid strides have been made in the growing of citrus fruits which will eventually be reflected in the increased purchasing power of the Transvaal.

DURBAN, NATAL, SOUTH AFRICA, Nov. 8—Durban is the summer resort for all citizens in Johannesburg and many other parts of the Transvaal. Durban is 400 miles by automobile from Johannesburg. It is the business center of the Province of Natal. Before the coming together of the several South African provinces into the Union of South Africa, Maritzburg was the capital of Natal, but Durban now holds the business center. Durban is one of South Africa's principal ports for the export of wool and corn, and a big bid has been made for these industries opening up in British South Africa. The value of Durban as an automobile center has increased. Ten years ago Durban was the chief port for Natal shipping, but little else. At that time it started developing and has continued to gain so that now it is counted as one of the five or six real business centers of South Africa.

Town gardens, Durban

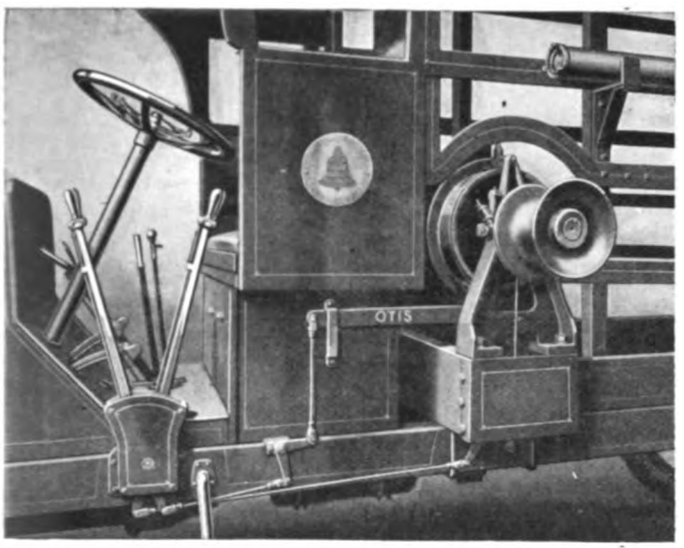
The Durban of to-day differs from the Durban of 10 years ago about the same as the 1918 automobile model differs from the 1908 model. The city is really one of mushroom growth, and is no longer merely a calling place for vessels but the most popular summer resort in South Africa. The city is exceptionally well laid out, is particularly clean at all times, and merits the name of Dainty Durban, which has been generally bestowed upon it.

As a resort city it is one of the most attractive centers for the motorist, and to-day there are between 5000 and 6000 automobiles in the city. There are but few cars in the district adjoining Durban.

The Province of Natal differs very considerably from other provinces in the Union inasmuch as one finds that a comparatively small area such as is not or cannot be turned to good account in agriculture. Most of the sugar plantations are in Natal, and this province, generally spoken of as the Garden of South Africa, is the most thickly populated province. In Natal one meets the British farmer more often than in any other province of South Africa. Already the farmer is a good buyer of motor cars. The car best suited for these farmers is one reasonably light, must have a good clearance, must be substantially built, and should sell at a reasonable price.

The conditions at Maritzburg are almost diametrically opposite to those of Durban. You find very few cars in Maritzburg, but a great many in the district adjoining it.

Impurities in Malleable Castings



FROM the point of view of analyses, malleable castings contain more silicon and sulphur but less manganese than steel, and while in steel it is considered advisable to keep the phosphorus under 0.06 per cent, the phosphorus of malleable castings can safely be a maximum of 0.25 per cent. In malleable castings the carbon can be considerably reduced by annealing, but the silicon, sulphur, phosphorus and manganese remain practically constant. Under these conditions, says E. Adamson, in a paper read before the Staffordshire Iron and Steel Institute, only certain particular classes of pig iron are suitable for malleable castings, while for steel—broadly speaking—any pig iron can be used, according to process.

Otis Power Winch for Motor Trucks

Serviceable for Hoisting Loads, Erecting Poles, Drawing Cable Through Conduits and for Various Other Uses

FOR use in handling the loads of heavy trucks the Otis Elevator Co., New York, has developed a power winch which can be fitted to the truck. It consists of a winding drum which rotates freely on a drum shaft, a worm and gear reduction inclosed in a cast-iron gear case, a clutch-operating device and a brake. This power winch has proven of particular service to electric light and power companies

Otis winch on truck, showing the operating levers

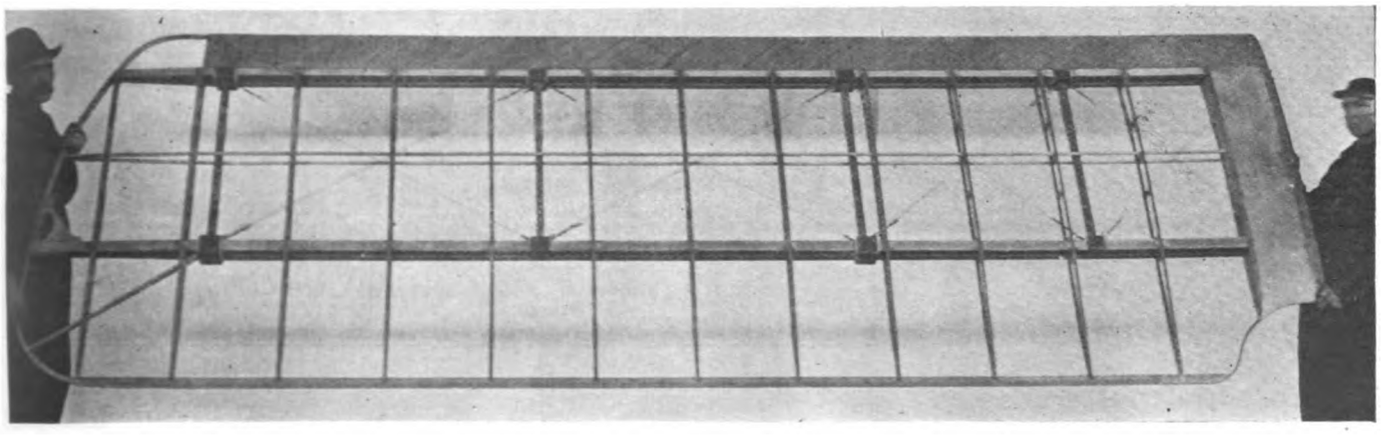
for hauling reels, pulling electric light wire through conduits, etc. Telephone companies use the winch for raising poles, and moving concerns use it for hoisting pianos and other heavy articles. The winch is also a very handy piece of apparatus on the trucks of contractors.

The worm gear is made of bronze and the worm is cut from a solid forging. To the outer end of the worm shaft is fitted a ball thrust bearing, designed to take up the end thrust in both directions. Worm and gear are inclosed in a cast-iron case which is provided with hand holes, sight holes and clean-out pockets, so that the worm and gear surfaces may be readily inspected without removing the entire upper case. The outer drum shaft bearing of the gear case is equipped with marine thrust grooves, which are utilized to keep the worm gear and worm in proper alignment.

The winding drum, which is 8 in. in diameter, has a face of 12 in. and flanges 18 in. in diameter, is capable of carrying about 650 ft. of ½-in. steel rope. The drum is fitted with brass bushings and rotates freely on the drum shaft in either direction. For lubrication the oil chamber in the drum is occasionally filled with heavy machine oil.

Secured to the outer ends of the drum is the brake wheel and flange of electric steel. The brake is of the double-acting external type and is lined with multibestos. It is of sufficient power to safely hold the greatest load that can be handled by the winch. The clutch mechanism consists of a semi-steel three-point jaw clutch which is drawn into engagement with corresponding jaws integral with the drum by means of a conveniently located lever.

Nigger Head for Hoisting or Hauling



In addition to the winding drum, a nigger head is furnished as standard equipment on either end of the drum shaft. If desired, the company furnishes nigger heads on both ends of the drum shaft at a slight additional cost. The nigger heads provide a convenient means of hoisting or hauling with manila ropes when it is not desired to use the drum with steel ropes.

For operating the Otis winch, power from the truck engine is used, which is transmitted to the winch by means of a sprocket and chain or by a universal joint connection between the worm shaft of the winch and the power take-off shaft of the transmission or main drive shaft. The winch is designed to be mounted directly behind the driver's seat and is so arranged that connections can readily be made from the clutch operating device and brake lever to the hand levers located convenient to the driver's seat. Thus the truck operator has direct control over the operation of the winch without leaving his seat.

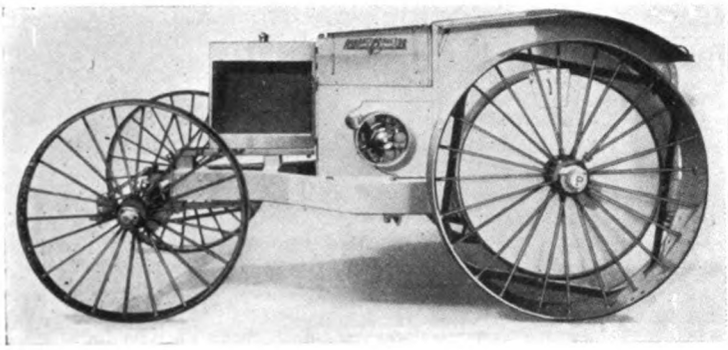
Airplane Wing Construction



THE accompanying photograph shows a wing designed by the engineering force of the Lawson Aircraft Corp., Green Bay, Wis., for the new MT-2 Lawson machine, which is to be used for advanced training and reconnaissance work over the trenches. It is constructed entirely of wood, except for the metal fittings which connect the internal compression struts to the spars. The wing tip is bent from one piece of second growth white ash, and the internal wing fittings are pressed from one piece of steel, with projecting prongs to take the cross struts, thus making these members into sockets.

Dope Poisoning

(*Continued from page* 495)

worked in a narrow aisle with wings stacked close on either side, drying or in course of doping, and the sun beat on the glass roof and walls.

The nervous symptoms were sometimes fairly severe, resulting in loss of consciousness, with temporary respiratory failure. Two men were doping wings in a room that had no artificial ventilation, and one of them was taken with dizziness and faintness and fell to the floor. The other, stooping to help him, upset the pail of dope, spilling some of it on the clothes of the prostrate man. Both had to be carried out into the open air, but the second man revived fairly quickly; the first was unconscious for a short time and had an alarming respiratory failure, so that artificial respiration had to be resorted to and his dope-soaked clothing removed before he revived. However, by the time the doctor arrived he was breathing again, and neither man experienced any lasting result, though both felt weak for several days.

Nausea and headache are likely to follow one of these attacks of dizziness and faintness, but symptoms of abdominal disturbance of any seriousness were apparently not present.

Constipation was complained of only occasionally. Two men spoke of an increased craving for food at the same time that they were losing weight. Men who use tetrachlorethane dope for many weeks or months are said by fellow workmen to have a dull, dopey look in the eyes.

The men using acetone-amyl acetate-benzol-methylalcohol dopes did not complain nearly so often of dizziness, drowsiness, or attacks of faintness as did the tetrachlorethane men.

Some of the men using amyl-acetate dopes complained of headache during the first hours of work, of cold hands and feet, of itching eyelids, watery eyes, feeling of dryness in the throat, and that vague sensation of drowsiness, slight nausea, and weariness, which they describe under the term dopey.

There seems to be a general impression among the men who use tetrachlorethane dopes that they are less harmful than the dopes containing amyl acetate. The disagreeable odor of the latter and its irritating effect on the eyelids and on the throat are experienced at once, while tetrachlorethane, with its less overpowering odor, has no immediate effect, and seems to the workmen comparatively harmless. This opinion is shared by some physicians also, but it is quite wrong. Amyl acetate, though disagreeable, is not at all a dangerous poison, while tetrachlorethane is a slow, insidious poison to the cells of the liver and kidneys. Nevertheless, it is not at all unusual to hear a foreman say that he tried at first to use an amyl acetate dope, but had to give it up and take one with tetrachlorethane as a solvent, because his men could not stand the banana oil.

It must be remembered that the effect of these volatile solvents on workers in American airplane factories has not really been tried out. They have been exposed to fumes only at intervals and for short periods. Fifty-three dopers were asked as to the number of weeks or months they had been employed and all but five had worked less than a year. Seventeen had been doping for less than one month, 12 from one to three months, and 11 from three to six months, leaving only 13 who had worked over six months.

This is one reason why there has been no serious poisoning from volatile dope solvents in this country up to the present time. Another reason is found in the fact that much of the doping has been done in the open air, or under a shed with open sides, and so the fumes from the solvents were rarely heavy. Naturally since our entrance into the war these conditions have changed, and we have no reason to think that we shall escape the experience of the British and Germans with toxic jaundice if we continue to use tetrachlorethane dopes and do not adopt vigorous methods for the protection of dopers from fumes, for from now on there will be many men at work doping throughout their full shift, and they will be in rooms filled with dope-covered fabric, nor are the other solvents free from dangers. Indeed their poisons may prove to be greater than we now think.

British Instruction to Avoid Dope Poisoning

(*Continued from page* 495)

out, improvement in health has resulted. And when such an arrangement is adopted occasional necessary overtime might, it is suggested, be undertaken by those on the out turn rather than by those who have already worked a full day in doping.

In addition to the alternation referred to, in one factory the women engaged in doping are made to spend half an hour morning and afternoon in the open air, so that no spell of work in contact with the fumes lasts longer than two hours.

(c)—*Periodic medical examination.*—A fortnightly medical examination has served a useful purpose, both in reassuring the workers and also in enabling those showing premonitory symptoms to be suspended or transferred to other work. The objective signs, however, which the surgeon has to guide him are few, and he can be materially assisted by information from the foreman or matron as to the state of health of the workers in the intervals between his examinations. After each visit the surgeon should state in writing the names of those (if any) whom he considers should be—

(a)—Suspended as definitely suffering from dope poisoning necessitating absence from work until they are quite well, or

(b)—Transferred temporarily to other work as a precautionary measure on account of equivocal signs.

8—Medical supervision on these lines has been adopted on their own initiative or on suggestion from the factory department in several aeroplane works, and the same course should be pursued in all where doping is continuous. It is important that it should be carried out by a medical practitioner who is familiar with the nature of the work and the symptoms to which it may give rise, preferably by the certifying surgeon, as he is in touch with the department and is thus kept informed of the latest observations on the subject. A health register and instructions as to the conduct of the examination will be sent by the medical inspector to the medical man whom you appoint for the purpose as soon as notice of his name is received here.

9—A worker suffering from effects of dope should be excluded from all contact with it until he is quite well, a medical certificate to that effect being obtained. Instances are known in which premature resumption led to recurrence of symptoms in an aggravated form.

10—*Instruction to workers.*—Certain apparently small points have been noticed which have a bearing on liability to attack. Some instruction to new workers as to how they can best avoid inhalation of fumes without interfering with work is called for, especially bearing in mind the youthfulness of some of them.

(a)—Doping should be commenced at the end of the wing nearest to the exhaust fans and should proceed backward from that point.

(b)—In some factories the wings, as soon as the doped surface is "tacky," are carried to a drying room or closed chamber (separately ventilated), thus diminishing largely risk from inhalation of fumes. Where no such arrangement exists, the wings should be placed to dry in a position between the workers and the exhaust draft, but not so as to obstruct the fans.

(c)—After doping, the safest position for the worker is that nearest to the fresh air inlets, but frequently men and women are seen standing close to the exhaust, and therefore breathing the air which is most highly charged with the noxious vapor; the reason being that either the flat top of the outlet duct has been found a convenient place to keep dope pots, brushes, etc., or the light is better there than at the far side. Shortsightedness, unless corrected by glasses, should debar from taping if not from doping.

(d)—Work should not be commenced on an empty stomach, and where tetrachlorethane is an ingredient of the dope a worker "must not be allowed to take a meal or to remain during the times allowed to him for meals in any room in which such substance is used." (Factory Act, 1901, S. 75.)

Hence the need for provision of a properly equipped meal room on lines suggested by the health of munition workers' committee is self-evident.

11—Even if, as is hoped, discovery of an efficient substitute enables use of tetrachlorethane to be eliminated from the dope, exhaust ventilation will still be necessary to prevent the effects (fortunately much less noxious) from such solvents and diluents as benzene, acetone, and methylated spirit, which must necessarily continue to be used.

Cars at a Premium

TRANSPORTATION difficulties and the utilization of plant space for war work have resulted in the reduced automobile production which was predicted some time ago. The pendulum has now swung so far over to the other side that it is a matter for careful consideration whether or not the output of the factories this year is going to meet the demand of the country.

When the Ford Motor Co., for instance, curtails its output by 50 per cent it means that 1500 low-priced cars less are turned out every day. This leaves a demand which must be met by other concerns, and even if only two-thirds of this business were to be distributed among other manufacturers it would mean 1000 possible sales of low-priced cars per day. However, with production reduced all over the country from 30 to 40 per cent below what it normally would have been, it is difficult to see how the demand is going to be met.

Present indications are that automobiles are going to be at a premium by July 1. This is true not only of new cars but of used cars as well. Shipments to eastern points have been discontinued by several of the largest producing concerns simply because of freight embargoes. The result of this is that New York dealers are paying express rates for quick deliveries. It is even impossible to secure express equipment as promptly as desired, with the result that, unless cars are driven from the manufacturing points to the eastern market, they cannot be delivered.

The next two months are the most difficult period of the year for drive-aways in the Middle West, where the roads are of the so-called gravel construction. These roads become so soft in the early spring that they are impassable, and manufacturing districts are practically isolated in some instances as far as road traffic is concerned.

With this situation in mind, manufacturers in a position to produce cars at the present time should by all means turn out the maximum possible number to take advantage of the coming market. The material situation is no longer a hindrance to any serious extent, and with the roads cleared for drive-aways there is no doubt that those who are prepared will reap a reward for their foresight in the months of May, June, July and August, as well as during the fall season.

Volumetric Efficiency

WHILE the term volumetric efficiency—which has come to be very much used in internal combustion engine literature, especially since kerosene and distillate have been widely adopted as fuel and preheating of the mixture has become necessary—has a fairly definite meaning, we do not remember ever having seen an exact definition. Efficiency in engineering terminology is generally defined as the proportion or the percentage of results actually obtained to the best results obtainable under ideal conditions.

Now, the most air that can be drawn into a cylinder by the method usually employed is that corresponding to the piston displacement volume at atmospheric pressure and temperature, and it would seem at first sight that this would be the logical basis for determining the volumetric efficiency. However, as the air is drawn into the cylinder, gasoline is mixed with it and vaporized, and this gasoline vapor necessarily occupies some space, so in actual operation it is quite impossible to draw in an amount of air equal to the piston displacement volume at atmospheric pressure and temperature. True, the relative volume of the fuel vapor is very small. With a weight ratio of 16 to 1 between the air and the fuel and a vapor density of the fuel of a little over 3, the volume occupied by the fuel in the gaseous state is only about 2 per cent of the total. Nevertheless, it is desirable that volumetric efficiency should have an absolutely definite meaning and it might be well for the Research Division of the S. A. E. Standards Committee to say whether it should be based on a piston displacement volume of air at atmospheric pressure and temperature or on an amount of air smaller than this to make allowance for the fuel vapor in the air.

The Liberty Engine

NOW that it has been conclusively demonstrated, and we hope to the satisfaction of all those who opposed the standardization work in this engine, that the Liberty aviation engine is a success far beyond the expectations of the most sanguine, that the War Department and the Aircraft Production Board will not fail to impress the country through a good publicity campaign of what has really been accomplished.

The development of the Liberty engine stands as one of the greatest victories of the war and as one of the great if not the greatest contribution America has made. Ten times more has been accomplished with this engine than is generally known throughout the country, due to the desire to keep the information from those who might misuse it. It would be better to get much of this information to those in our own land who do not know it and would be better war workers if they did, than to work so hard to keep in the dark what has unquestionably been known in Germany for months.

A great good can be accomplished at home by a fuller knowledge of the performance of this engine. As yet not a few of the baseless rumors of troubles with the engine have not been sufficiently stamped out. The enemy within our ranks has been very active and has been too quick to turn a situation into a veritable criticism or knock.

A recent example was that of a news item mentioning that the first Liberty engine had been shipped to a certain aviation field with instructions not to use it for flying but for instruction only, the kickback being the inference that it was not reliable enough for flying.

This was not the case, the aviation field in question asking for one for instruction purposes only. The engine shipped was one of the earliest models and which did not incorporate all of the refinements of the jobs that are now going through production and are being shipped to France and being flown so generally in this country.

Some remarkable cross-country flights have been made and the nation should get this convincing evidence of the prowess of the engine and the plane.

The Kerosene Knock

THE exact reason for the kerosene knock, which has been such a problem to overcome in the burning of kerosene in tractor engines, remains a much mooted question among many tractor engineers. Reducing the compression, adding a percentage of water to the explosive mixture, improved water-jacketing of the cylinder heads and cylinder walls, the valve seats and the spark plugs, have all been tried, and while they bring results they do not strike at the fundamental solution of the problem.

Various explanations of the knock have been made but not sufficient research work has been done in different laboratories to give as complete an analysis of the subject as it warrants. The person furnishing a correct and comprehensive solution of the mystery will perform a peculiarly valuable service that should reduce the too general abuse of kerosene in that it is not being efficiently burned to-day as is gasoline. It is relatively easy to operate a vehicle on kerosene if no regard is given to the consumption per horsepower hour and flexibility, but where economy and flexibility are taken into consideration the problem becomes very much greater.

One research engineer, who has been working actively on this task for several years and who is yet far from the end of his labors, ascribed the kerosene knock to secondary explosions or detonations, some of which take place quite some time after the original explosion and often after the piston is well past the top center. Some of these secondary explosions are very violent, producing high pressures for very short periods. Numerous experiments seem to establish a marked similarity of such explosions with different grades of kerosene, whereas in other fuels such detonations are entirely lacking. These explosions and the resulting knock seem the best evidence that kerosene is not being efficiently handled. The very nature of kerosene makes the problem much more difficult than with other fuels which are more uniform in their constituency.

Tractor Ratings

ONE benefit to be gained from industries getting together and co-operating as compared with keeping apart and needlessly competing is that one may profit by the merits as well as the faults of the other. In this respect there is opportunity for more good coming to each industry by the automobile and the truck and the tractor getting into closer contact. Each has suffered or is suffering from similar abuses.

First the automobile was overrated in horsepower and speed and damage was done. Some firms seriously injured themselves by such tactics. Then came the motor truck and the merchandising talent ran rampant in claiming 100 per cent overload, high speeds and lack of attention. Many a good truck prospect was killed by the extravagant claims of the merchandiser. Lastly, we have the farm tractor being overrated by not a few concerns, only to find the maker reaping his own wild oats by the antagonism bred within the farmer and also the doubt that arises in the farmer's mind. Already tractor overrating is exhibiting a boomerang influence and much greater effect will follow if the pernicious policy is continued.

It is unfortunate that some tractor makers practically refuse to co-operate on some standard method of rating. Each firm thus refusing is only fogging the issue with the farmer, and while such makers may picture some individual advantage it has happened in the past that those gross offenders have always had to bear their proportion of the punishment.

It will prove a great advantage to the entire tractor industry not to befog the issue but to get together and make tractor sales easier for all. Co-operation will accomplish much more than misleading competition.

Latest News of the

Agreement With War Industries Board

Favorable Arrangements for 1918 Production—Suitable Coal Agreement

NEW YORK CITY, March 7—An agreement has been reached between the National Automobile Chamber of Commerce, through its Fuel Committee and the War Industries Board, with regard to passenger car production, which is a very favorable one as relating to the automobile industry, and has every indication that the War Industries Board is giving the most careful consideration to all industries.

The agreement is good evidence of the fact that official Washington recognizes how essential it is to maintain all industries whether so-called direct war industries, that is, those manufacturing guns, shells, clothing and everything needed in the war zone, and also what has been designated as non-war industries, namely, those in which the products are not so entirely utilized in the war zone.

According to the agreement the automobile manufacturers are asked to reduce their 1918 output approximately 30 per cent as compared with what their plans for 1918 production were on July 1, 1917. Supposing at that time a firm committed itself to parts and materials for 100,000 automobiles, such a firm, under the new agreement, would produce 70,000 machines by July 31, 1918.

Such an agreement is very favorable to the automobile industry in that the majority of cases it will not mean any different program of production than what the different factories have been pursuing for many months. In other words, the majority of factories have been manufacturing at a lower pace than 70 per cent of their commitments for last July, and as such the present agreement does not have any effect. There are other companies which may have been manufacturing but 50 per cent of their commitments, and such will, under the agreement, be permitted to increase from now until next July in proportion as they have dropped behind the 70 per cent mark from last July up to the present time.

The agreement should have a very stabilizing effect on the industry in that there is now a definite understanding with the government, and such agreement means a recognition on the part of the government of the essential work of the automobile industry in war times. It was very questionable if such a favorable agreement could have been accomplished last November when the chrome steel crisis arose, and it is very questionable if anything so favorable could have been arrived at in January when the coal crisis was on. The industry certainly can congratulate the War Industries Board on the broad view it takes of industry in general and the necessity of properly looking into the national functions of an industry, such as the automobile industry, before determining upon any policy of curtailment with regard to it. It is almost a certainty that if a curtailment had been arrived at in November or January, it would have been much more severe than the present one.

The present curtailment can scarcely be looked upon in the sense of the word, as there will only be two or three firms at the outside that may have to reduce present production.

Undoubtedly the right of appeal by any manufacturer to the War Industries Board is covered in the agreement, as there is nothing to indicate that the War Industries Board has not the fullest appreciation of the national and world necessity of the automobile as a conserver of man power in these war days.

The present agreement, besides being with the War Industries Board, which covers the question of materials for automobiles, and also takes consideration of transportation, etc., further is an agreement with the Fuel Administration and insures the manufacturer coal. This is a very considerable factor in the case.

—

Liberty Engine Production

WASHINGTON, March 5—The Liberty airplane motors will soon be turned out at the rate of 300 per day from 5 specially designated automobile and airplane factories. The Ford Motor Co. will produce 100 a day, Packard Motor Co., Marmon Co., Lincoln Motors Co. and the General Motors Corp. 50 a day. The present program calls for 22,000 planes to cost about $2,0000,000,000. The greatest production is expected to be attained early this summer. At this time manufacturing energies are concentrated to the high power battle planes of the 12-cylinder type, which are developing 1 hp. to every 2 lbs. weight, 450 hp. to approximately 900 lbs. weight.

—

$450,000,000 More for Aircraft

WASHINGTON, March 6—The War Department yesterday asked Congress for an additional appropriation of $450,000,000 for aircraft. Of this amount, $200,000,000 is needed to make up a deficiency in the $640,000,000 aviation fund provided last year, and the remainder will be used for new aircraft supplies and equipment.

N.A.C.C. Withdraws from Automobile Committee

Hugh Chalmers, Its Representative, Resigns—Lee Also Has Withdrawn

NEW YORK CITY, March 6—The Automobile Industries Committee, so far as the National Automobile Chamber of Commerce, Inc., is concerned, has ceased to be a representative of the chamber, and Hugh Chalmers, the N. A. C. C. representative on the committee, has resigned. For some months Mr. Chalmers is going to give his services to the N. A. C. C. in connection with the Washington work, as he is very familiar with Government matters, due to his poisition on the Automobile Industries Committee since its inception last November.

The N. A. C. C. for several months has been maintaining its own Washington office under the direct management of Alfred Reeves, its general manager, and this office will, it is understood, continue to be the point of contact between the Chamber and the Government departments.

The Automobile Industries Committee formed last November consisted of A. W. Copland, representing the Motor & Accessory Manufacturers, Inc.; Hugh Chalmers, representing the N. A. C. C., and J. R. Lee, representing the Ford company. Mr. Lee has withdrawn from the committee, so that there remains but Chairman Copland representing the accessory industry. It is understood that a meeting of the Motor & Accessory Manufacturers will be held soon at which its attitude with regard to the committee will be taken up.

Since its inception the Automobile Industries Committee has accomplished much good. It was appointed at the time of the chrome nickel crisis when shipments of this metal to the automobile industry were being stopped. At that time the Government's attitude towards the industry was that of a non-essential. The committee served as an excellent point of contact not only between the Council of National Defense, but also between Government departments. The attitude of the Government towards the industry has changed from that of considering it a non-essential up to that of considering the passenger car a public utility as it was considered during the coalless days in January. The committee threw itself into the breach at the critical period in November and warded off any precipitate

Automotive Industries

Plan Strict Policy for Industry

Some Curtailment of Non-War Manufactures — Coal Production Hampered by Transportation

WASHINGTON, March 6—The attitude of the Government toward industry during this year is awaited with interest by all manufacturers. Up to this time we have had many conflicting opinions and conflicting decisions.

Starting the war with hazy ideas for completely abolishing some so-called non-essential industries and seriously curtailing others, most of the officials here have now revised their opinions to a more logical basis.

We can gather some idea of the attitude of the Government toward industry by the President's outline of the increased functions of the War Industries Board and conveyed by him to Bernard M. Baruch this week in a letter requesting Mr. Baruch to accept the chairmanship of the War Industries Board. In addition, in an unofficial letter to Waddill Catchings of the United States Chamber of Commerce, George N. Peek, Industrial Representative of the War Industries Board, has made clear his personal views and those of some of his associates in the Council of National Defense. These are not strictly official views, but might be regarded as quasi-official.

The views of Mr. Peek and President Wilson are particularly important, because Mr. Peek represents the Government in its dealings with the automotive industries. Having just concluded a series of conferences with the fuel committee the President's views show the attitude we may expect from the War Industries Board, Fuel Administration and other Government agencies toward the automotive industries as regards allowances of fuel, steel labor and so forth, for we may be assured that all Government departments will reflect the presidential viewpoint.

"The first consideration of the nation and of all its industries," stated Mr. Peek, "must be to contribute the utmost toward winning the war, and to that end business must when necessary be diverted from its established channels into new channels. Or if absolutely necessary, the flow must, during the war, be entirely stopped in order to provide adequate labor and materials for war needs.

"It does not, however, follow that there will be less business than usual, but rather more unusual business."

With regard to non-essentials, Mr. Peek said that "if the so-called non-essential industries are cut off many of them would be ruined and others permanently crippled.

"War industries and railroads must have at least 100,000 tons more coal per day than they had in 1917 or the flow of war necessities will be dangerously interrupted. This increase must be met by curtailment of the so-called non-essential production and by economy at every furnace door, both household and industrial.

"The demands for 1918 to carry out the program for production of necessities for the war, in addition to the normal business, would greatly exceed any possible production and distribution of fuel, so there is but one remedy which is to limit the production of non-war industries sufficiently to provide for:

"(1) War needs direct and indirect.

"(2) Necessities for public welfare and domestic consumption.

"In accomplishing the desired end it should be our effort to divert the energies of non-war industries as far as possible to the production of essentials for war so that each industrial center may use existing facilities with its labor living at home, happy and contented.

"In the re-adjustment process it is inevitable that the normal business of some industries must be interfered with in order that production of war and public necessities be kept at the maximum. It may be that some plants because of lack of power, shortage of labor, raw materials or transportation may have to suspend entirely. These sacrifices must be endured in the interest of our first object, which is to win the war."

The statement also points out that on account of transportation conditions the United States probably will mine little if any more coal in 1918 than in 1917.

In his letter to Mr. Baruch, President Wilson outlines the vastly increased powers of the War Industries Board as follows:

(1) The creation of new facilities and disclosing, if necessary, the opening up of new or additional sources of supply.

(2) The conversion of existing facilities, where necessary, to new uses.

(3) The studious conservation of resources and facilities by scientific, commercial and industrial economics.

(4) Advice to the several purchasing agencies of the government with regard to the prices to be paid.

(5) The determination, wherever necessary, of priorities of production and of delivery and of the proportions of any given article to be made immediately accessible to the several purchasing agencies when the

W.T.B. May Change Export Plans

Regulations Between Maker and Distributor on War Tax Will Probably Be Altered

WASHINGTON, D. C., March 5.—The War Trade Board has been asked to modify its present plan of export regarding automobile parts. Under the existing scheme separate blanks must be used for every different kind of metal exported. This naturally would necessitate unreasonable labor for parts exporters. It is expected the War Trade Board will view this matter sanely and modify its regulations.

The Internal Revenue Department has also had attention called to unreasonable regulations. At the present time when an automobile maker ships a chassis to a dealer he pays 3 per cent tax on it, and the tax ends there. However, when an automobile maker like Cadillac ships a chassis to its agency in New York, although entirely separate from the parent company, the tax is demanded not only on the chassis but also on the body which the agency places on the chassis. The dealer is not asked to pay this tax. The agency is asked to pay it, and this creates unfair competition, as it forces the Cadillac agency, for example, in New York City to pay more than the Cadillac dealer in another nearby city. It is anticipated the Internal Revenue Department will rectify this present difficulty.

Return Load Gains

The matter of return loads on trucks used for rural express purposes is becoming very important, and it is receiving much consideration. The Fuel Administration and the United States Chamber of Commerce have both testified this past week in publicity to the growing importance of the use of motor trucks for transportation and freight and of the use of the return loads plan.

—

Pennsylvania Buys Tractors

WASHINGTON, March 7—The State Safety and Defense Commission of Pennsylvania yesterday appropriated $50,000 to purchase 25 farm tractors to be rented to farmers by the State Department of Agriculture at as low rates as possible. Lieutenant-Governor McClain is chairman of a committee to make the purchases. There will be more tractors purchased after further appropriations are made in the near future.

Trucks End Railroad Congestion

Freight Situation in Hartford Relieved by Co-operation of Mayor and Truck Owners

WASHINGTON, March 4—The Fuel Administration has notified all of its various state divisions of a plan by which Mayor Frank A. Hagerty, Hartford, Conn., took advantage of the recent fuel shut-down order to use motor trucks for improving the freight and fuel situation.

When the fuel order was issued Mayor Hagerty got in touch with the heads of several large industrial plants and proposed that they use as many of their men and trucks for the handling of freight as possible during the idle days. A general invitation was issued to the manufacturers and merchants of Hartford for a meeting the following morning, together with a request that all manufacturers having vehicles suitable for moving freight should volunteer their use, together with men to operate them.

Large Manufacturers Respond

The large manufacturers and merchants responded almost to a man, and at the meeting an executive committee was formed to manage the work. A central office was obtained in one of the banks, telephones installed and comprehensive plans for the work immediately laid out.

Actual work began the following morning. The railroad officials had reported that the congested condition of the railroads had been brought about largely by the fact that consignees had been waiting to have their cars placed on their own private sidings, and that freight was coming in too quickly to permit this. It was therefore decided by the committee that cars would be handled as quickly as possible, and placed on public as well as private sidings. Under the circumstances consignees were not to insist that the cars be placed on private sidings, but to take them wherever they were placed by the railroad.

Handle Own Goods First

The committee also decided that each concern furnishing trucks should devote its attention first to handling its own cars, and, after these were emptied, permit the truck to move other freights irrespective of the consignee. This meant that some freight would be trucked without cost to particular consignees, but the work done was so important that this question was subsidiary.

The railroad made a special effort to place full carloads of freight where they could be reached by trucks. As a result of 2 days' work the 300 freight cars which had been congesting the local tracks were unloaded.

The committee was ready to renew the work on the following Monday, and on each Monday since, but the campaign of the first 2 days was so successful that this was not necessary. The committee is still organized and closely in touch with the local freight situation, so that it may step in at any moment to relieve congestion.

—

Little Relief from Lifting of Embargoes

DETROIT, March 1—The lifting of practically all Michigan and Ohio embargoes has relieved the tight freight situation but slightly. Manufacturers as well as railroads hold that this congestion was caused by the recent most unusual weather conditions, the worst the railroads ever had to fight, and that as long as a car shortage exists there will be no relief for shippers. The government is using so many cars in the transportation of grain, munitions and other necessities of war that only a small percentage of railroad equipment is available for individual shipping requirements. Most of the cars released by the lifting of embargoes went into government use. The Ford Motor Co. reports, however, that this new condition has given it an opportunity to divert to the East and South some of the traffic that was formerly, of necessity, going West, thus making it possible to equalize the distribution of automobiles.

—

Canada Removes Import Duty on Tractors

WASHINGTON, March 4—The Canadian Government has issued an order providing for the free admission of farm tractors until Feb. 7, 1919. The order reads as follows:

"Remission and refund of duty is hereby authorized in respect of traction engines costing not more than $1,400 in the country of production, designed to be moved by steam or other motive power for farm purposes, and parts thereof for repairs; and traction attachments designed and imported to be combined with automobiles in Canada for use as traction engines for farm purposes and parts thereof for repairs."

The duties thereby remitted amount to 27½ per cent ad valorem in the case of imports in the United States, it being assumed that the exemption applies to both the customs release and the war surtax.

—

Gear Manufacturers to Convene

NEW YORK, March 4—Gear Standardization will be the principal subject of discussion at the second annual convention of the American Gear Manufacturers' Assn. to be held at the Green Brier Hotel, White Sulphur Springs, W. Va., on April 18, 19 and 20. The convention will begin with meetings of committees on Thursday morning, April 18. The first session will open at 1:30 with addresses by President F. W. Sinram and a representative of the United States Chamber of Commerce, of which the association has just become a member. The banquet of the association will be held Friday evening.

Plan Rural Express Service

Highway Transport Committee to Establish Routes from Farms to Cities

WASHINGTON, March 4—Considering the shortage of foodstuffs, the greatest problem of the near future, the Highway Transport Committee, headed by Roy Chapin, has worked out a plan for rural express services from farms to cities wherever practical. The committee has made a special study of the conditions in Maryland and the area around Washington, and is arranging for rural express to provide transportation of food for the new 100,000 inhabitants of the Capital.

National Survey Carried On

A national survey has been carried on in co-operation with the Department of Agriculture and the Food Administration. Questionnaires have been sent to farmers and to operators of rural express systems in Maryland and near by and some have resulted in important replies. A blueprint hanging in the office of Roy Chapin shows the complete chart of the service in Maryland, displaying the motor truck routes from Washington to Germantown, Latonville, Redland and Ashton, an aggregate of 93 miles. Seven trucks are used, making a total daily mileage of 286 miles. Out of Baltimore there are 14 such routes, aggregating 1192 miles daily. The good roads of Maryland are one of the factors that stimulated the service there. Maryland has 1500 miles of good roads, of which 300 miles are used for rural express.

The questionnaires sent out resulted in urgent requests by farmers for better roads. Many said they would go out of business if they did not have better roads to help them get their produce to market. The replies also showed that the trucks not only haul the goods to market but help bring other merchandise back to the farmers from the city merchants. As an example of the work done, one man operating rural service brings 400 gallons of milk and cream daily to Washington. Recently he also hauled 827 bushels of wheat to Rockville, Md. He hauled 200 barrels of corn from the field to Washington in 7 days, and his hauls include eggs, poultry, fruit, potatoes and calves, and on his return trip he takes coal and other merchandise back from the city to the farmer.

One farmer near Baltimore reported that in addition to his regular route service the operator in his district also handled for him 100 live hogs, 200 live sheep and 800 bushels of wheat, and brought back to the farm 190 tons of fertilizer, 80 tons of lime, 65 tons of building sand and 70 tons of coal.

One reply showing the importance of the rural express system was from a farmer who said that "without the truck it would take a man and a pair of horses

Digitized by Google

2 days to make the trip to Washington and back, which is now made in 3 hours with the truck."

Another reply was to the effect that "I favor the rural express system because labor is scarce and the people in this neighborhood would have to go out of the dairy business without the rural express service, as the railroad station is 5 miles away over a dirt road and the train is due there at 7 a.m."

Chapin, discussing the situation, reported: "Mr. Hoover refers to corn and potatoes rotting because they cannot be moved. Tours through Maryland show exactly that condition because farmers cannot get their produce to railroad stations for shipment."

The Maryland rural express systems are regulated by the public service commission. The State Highway Commissioner of Maryland and the State Highway Commissioner of Virginia are preparing maps and routes showing how Washington can be served as Baltimore is.

—

Motor Parcels Post Route in Ohio

COLUMBUS, OHIO, March 2—The first Ohio motor parcels post route has been established by the post office department between Columbus and Zanesville, via Reynoldsburg, Etna, Hebron, Brownsville and Hopewell. This is a distance of about 60 miles. A 2-ton truck, capable of maintaining a speed of 25 miles an hour is being used, and additional trucks will be installed as the volume of business increases.

—

Shipping Maxwells to Lyons Fair

DETROIT, March 4—The Maxwell Motor Sales Corp. received half of the total shipping space allotted for the use of automobiles being shipped to the Third Annual Fair at Lyons, France. In the shipment were 2 truck chassis, 2 touring chassis, 1 town car chassis, 1 sedan, 1 roadster, 1 all-weather top, 5 touring cars with right hand drive and a Chalmers touring car. The freight charges will be as great as the total cost of the cars in this country. The cars will be admitted free of duty unless they remain in France.

—

Interurban Shipments Not Popular

DETROIT, March 4—The few automobile manufacturers who are sending their cars over the Interurban lines are doing so only where it is absolutely necessary. Great difficulty is experienced in the loading of them due to the fact that the electric cars are of the side door type which makes it difficult for the automobiles to enter.

The Buick company does not ship more than 6 cars a week via the electric route. Reo averages 15 carloads a week, and has been using this mode of shipping for 30 days. This form of transportation permits only short hauls; when the terminal is reached the car must either be transferred to another line or proceed on its own power.

G. M. Earnings Are $26,285,951

Equals 34.2 Per Cent on Common—Increase in Profits Since Reorganization

DETROIT, March 6—The report of the General Motors Corp. which succeeded the General Motors Co. on Aug. 1, 1917, shows that the General Motors properties earned undivided profits of $26,285,951 during 1917, after charging off $6,901,889 for war taxes and extraordinary expenditures. This is equal to 34.2 per cent on the $76,873,300 common stock outstanding on Dec. 31.

The undivided profits in the 5 months from Aug. 1 to Dec. 31, amounted to $13,792,983 as against $12,492,968 in the first 7 months of the year. The former covers the operations of the General Motors Corp. and the latter those of the General Motors Co.

The balance sheet as of Dec. 31, shows current assets of $80,275,577, against current liabilities of but $15,524,044, giving a net working capital of $64,751,533. Cash on hand at the end of the year totaled $18,865,645.

Surplus on the common stock amounts to $26,285.951 as against $23,731,952 at the date of reorganization.

Comparison of results for the 1917 calendar year with those of the fiscal years ended July 31, 1917, 1916 and 1915 follows:

	Dec., 1917	July, 1917	July, 1916	July, 1915
Net profits of dep ...	$34,634,854	$29,132,542	$29,146,107	$14.926,322
War taxes & ext. exp...	6,901,889	4,053,315	.....	.....
Balance ..	$27,732,965	$25,079,226	$29,146,107	$14,926,322
G. Mo. prop..	27 389,737	24,780,916	28,789,560	14,457,803
Pfd. divs. ..	1,103,785	1.048,964	1,048,964	1,048.964
Sur. for com..	*26,285,952	$23,731,952	$27,740,596	$13,408.839

*Equal to 34.2% on $76,873,300 common stock outstanding.

The balance sheet of the General Motors Corp. as of Dec. 31, 1917, compares as follows with that of the General Motors Co. as of July 31, 1917, 1916 and 1915:

ASSETS

	Dec., 1917	July, 1916	July, 1915

Westinghouse Earnings About 19 Per Cent

PITTSBURGH, March 2—The Westinghouse Electric & Mfg. Co., in its current fiscal year, which ends March 31, 1918, will show aggregate sales of about $90,000,000 or about the same as the 1917 amount. Final surplus of the stock will be less than that of last year, due to war taxes and other factors. Surplus for dividends, after deduction of taxes, will probably amount to between $13,000,000 and $14,000,000, as compared with $18,079,889 last year. This is equivalent to 19 per cent on the total $74,812,650 capital stock outstanding against 24.17 per cent a year ago.

Unfilled orders on the books amount to $130,000,000, exclusive of the machine gun contract which will be filled at the plants of the New England Westinghouse Co. About 60 per cent. of this work is for the Government.

—

4616 Dodge Chassis in Army

DETROIT, March 2—Dodge Brothers report that they have 4616 chassis in government service, distributed among the Signal Corps and the Ordnance and Quartermaster Departments. Those in the Signal Corps are constructed with special truck bodies for carrying telephone and telegraph apparatus and laying lines of communication systems. The Quartermaster Department has 4 Dodge chassis fitted with a 2-ton Smith Universal Form-A-Truck attachment, and can be used with either creeper-type or 2-wheel rear drive. So far only four of these trucks have been constructed, and it is expected that these will be driven overland to Detroit shortly.

—

Peerless Cars Shipped by Trucks

CLEVELAND, March 4—The Peerless Motor Car Co. sent a shipment of passenger cars from the factory to Baltimore, last week, loaded on Peerless trucks. The cost was approximately the same as freight rates, and the time consumed in delivery was less than that required for express shipment. The cars were crated, mounted on the truck body, and arrived at their destination in perfect condition. Other shipments will be handled in the same manner, and it is planned to start 20 cars immediately for New York and Philadelphia.

—

Signal Corps Needs 10,000 Machinists

WASHINGTON, March 4—The Signal Corps of the War Department has issued a call for 10,000 machinists, mechanics, chauffeurs and other skilled workers. Men registered in the draft may be inducted into this service by applying to the local draft board. Men not registered may enlist at any recruiting station.

—

Ford Assembling Branches on Part Time

MILWAUKEE, March 5—Operation of the assembling plant of the Ford Motor Co. here was greatly reduced on March 1 because of the difficulty in keeping the factory supplied with materials and parts from the main works in Detroit. It is stated that 19 of the 38 branch plants have been placed on a temporary part-time schedule.

Headlamp Tests for Glare

Illuminating Engineers and S. A. E. Obtain Data on Maximum Necessary Light

NEW YORK, March 6—In order to obtain accurate data which might be the basis for reasonable uniform legislation covering automobile headlamps, the Lighting Division of the Standards Committee of the Society of Automotive Engineers and the Committee on Automobile Headlights of the Illuminating Engineering Society held a series of tests last night. These tests had as their object to obtain reliable data covering the following questions:

1—What amount of illumination is necessary to reveal a person, vehicle or substantial object at distances 150 and 250 ft. ahead of the driver's seat?

2—What is the maximum amount of light which may be allowed to reach the driver's eye from an oncoming car without producing intolerable and unsafe conditions of glare?

For the tests, a special apparatus was designed by the Society of Automotive Engineers consisting of two pairs of regulation headlamps having commercial bulbs, reflectors and plain front glasses. These were connected in parallel in a series circuit consisting of the lamps, an adjustable resistance and an ammeter.

How Tests Were Conducted

The test, for which between 50 and 60 observers volunteered, consisted of adjusting one pair of headlamps, by means of the rheostat, until the observer was just able to pick up the object, which was a man walking across the road at 150 ft. The test was repeated for 250 ft.

The lamps representing an oncoming car, 100 ft. distant, were then turned on, and with the lamps corresponding to those on the observer's car as he had last adjusted them to pick up the object at 250 ft., the observer varied the intensity of the lamps on the oncoming car until such brilliancy was obtained as in his opinion was compatible with safe driving. Readings were taken, giving the current draw, as the observer indicated he had picked up the various objects. These will be translated into foot candles at the objects and the averages obtained will serve as the basis of such recommendations as may be made.

Tests Made Jointly

The tests were made jointly by the two engineering bodies, the committee from the Illuminating Engineering Society comprising Dr. C. H. Sharp, chairman; E. C. Crittenden, P. W. Cobb, E. J. Edwards, C. A. P. Halporson, Jr., W. F. Little and W. A. McKay. The Lighting Division of the S. A. E. consists of M. E. McKechnie, chairman, Paul F. Bauder and Wm. T. Jones.

The tests were made on an unlighted stretch of Pelham Parkway, New York City.

Prohibit Private Flying Except Under License

WASHINGTON, March 5—To protect army camps and naval bases from possible attack by enemy airplane, President Wilson to-day issued an order prohibiting private flying of balloons and airplanes except by license of the Joint Army and Navy Board on Aeronautics. Any aircraft disregarding this proclamation, which does not apply to aircraft operated by the United States Army or Navy, will be considered hostile and fired upon.

—

Baruch Starts Conversion

WASHINGTON, March 7.—Bernard M. Baruch, chairman of the reorganized War Industries Board, has started to convert existing facilities where necessary to new uses as suggested by the President. He will co-operate with Dr. Garfield, Fuel Administrator, and has outlined the industries of the country as regards their importance as follows:

1—Manufacturers of food and similar necessities and the machinery necessary for their industry.
2—War materials and the fuel required.
3—Peace and peace time production.
4—Luxuries.

Mr. Baruch has not yet definitely decided upon a list of the so-called luxuries. Dr. Garfield's control over fuel will withhold from the unnecessary industries the supply of coal, thus automatically compelling war production.

—

Another Airplane Mail Route

WASHINGTON, March 7—The Post Office Department has under consideration establishment of an airplane mail route between Washington and Atlanta, Ga., connecting with the several military camps on that route along the lines of the airplane route to be established between New York and Washington.

—

Tire Manufacturers in War Conference

WASHINGTON, March 5—Tire manufacturers were called to Washington to attend a conference to-day with the Motor Transport Section of the Quartermaster Corps. It was decided to use the 40 by 6 dual tires on the standardized trucks in preference to the 40 by 10 single tires. This decision was not reached because of any known inferiority of the single tire but rather because of the definitely known qualities of the 40 by 6 dual tire, it being the policy of the Motor Transport Section not to deal with experiment for the present at least.

—

Army Motor Equipment Cost $54,000,000

WASHINGTON, March 2—The motor vehicle equipment for the 33 divisional camps of the United States army cost $54,000,000 according to figures given out here last week. A large part of this sum is paid for trucks. Each division uses 10 light trucks and 343 3-ton trucks. The cost of building repair shops and heating garages during the cold season amounted to $8,700,000.

Call Salesmanship Congress

Third Annual Session to Be Held in Detroit April 24—To Discuss War Problems

DETROIT, March 5—The World's Salesmanship Congress, third annual session, has been called in Detroit, April 24, 25, 26 and 27. The meeting has been called in advance of the usual dates in order to discuss the war questions at present troubling the nation's business men. The part of salesmanship in winning the war will be a prominent feature of the program. The leading speaker will be Herbert N. Casson of London, England, who is especially delegated by England to address the congress. Other speakers have not as yet been announced, but it is assured that the biggest possible men will be secured to discuss the vital points at issue. The following is a list of topics:

"To Win the War, Can the Nation do Without the Individual Business Man?"
"To Win the War, Must Business Earn to Maintain the Nation's Credit?"
"Must the War Be Waged Entirely on Present Savings, Not Earnings?"
"What Businesses are Non-Essential?"
"Is 'Non-Essential Industry' a Recent and Verbal Invention?"
"What Shall We Do with Business, to Win the War?"

Plan Strict Policy For Industry

(*Continued from page* 515)

supply of that article is insufficient, either temporarily or permanently.

(6) The making of purchases for the allies.

The chief function of the War Industries Board in the past was to make purchases for the Allies. Hence, these new functions display a considerable broadening of power to include practically complete control of all industries including conservation of existing facilities and resources, creation of new facilities, conversion of existing industries to war work, supervision of purchases not only by the Allies, but also by our various war and navy departments and control of priorities of transportation, of production and of proportions of any articles or materials.

Baruch, at the suggestion of the President, will act "as the general eye of all supply departments in the field of industries." It is expected that the new powers given the board will eliminate competition for supplies between U. S. departments and the Allies, thus centralizing purchasing power.

—

N.A.C.C. Out of Committee

(*Continued from page* 514)

action by way of curtailment that might have been taken at that time.

Since the appointment of the committee 472 different jobs in the way of manufacture of war orders have been placed with the manufacturers of automobiles, trucks and accessories and the committee devoted much of its time to the work of bringing Government departments and the automobile industry together. This work approximates $300,000,000 in Government contracts, this figure not including Ford contracts, which are said to range between $75,000,000 and $100,000,000.

The Automobile Industries Committee did good service for the navy in placing $750,000 worth of contracts for small parts, which otherwise would have been difficult to secure.

—

Changes in King Personnel

DETROIT, March 6—Changes in the personnel of the King Motor Car Co. gave practically a new staff of executives and also a change in the sales policy of the company. Following the resignation of H. C. Bradfield, the office of advertising manager has been abandoned, and hereafter the advertising will be handled by W. B. Nesbitt, New York. Salesmanship advertising details will be handled by Robert Walsh, who is assistant to Wallace Hood.

W. B. Nesbitt has been elected vice-president and will act as personal representative of Artemus Ward, Sr., who is connected financially with the company, and who, it is stated, recently pledged $500,000 additional capital to the company. Part of this has already been paid in.

H. A. Church has resigned as secretary, and H. D. McCullough, formerly of the Aluminum Castings Co., will succeed him.

—

Re-elect Daniel Willard

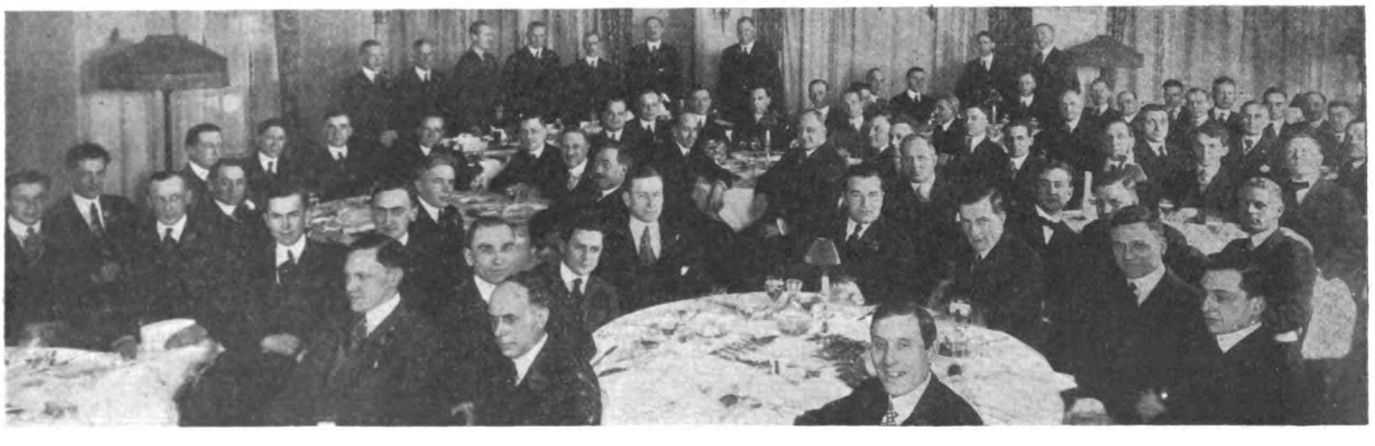
WASHINGTON, D. C., March 6—Daniel Willard was re-elected chairman of the advisory commission of the Council of National Defense at the annual meeting of the advisory commission yesterday. W. S. Gifford and Grosvenor B. Clarkson continue as director and secretary respectively of the commission as well as director and secretary of the Council of National Defense.

—

Wright-Martin to Make Planes, Too

NEW BRUNSWICK, N. J., March 6—The Wright-Martin Aircraft Corp., which heretofore has confined its activities largely to the production of engines, and at present is producing an order of 3000 Hispano-Suiza engines at the rate of 10 a day, is to take up the production of complete airplanes. It is understood the company is negotiating for 25 machines to be built at its Pacific Coast plant. Five hundred of the 150 hp. engines have been delivered and preparations are being made to get into production on the larger engines. The company has a contract for 3000 Hispano-Suiza engines of 300 hp. The company is to-day moving its executive offices from 60 Broadway, New York, to the New Brunswick plant.

—



Government Commandeers Platinum

WASHINGTON, March 4—The Government has issued orders through the Council of National Defense for the commandeering, for war purposes, of all crude and unworked platinum in the hands of importers, jobbers and wholesalers. The control will be exercised through the chemical division of the War Industries Board. It is not the intention of the Government to take over and handle directly the present stocks of platinum, but to regulate its shipments by certain conditions. The Secretary of War will fix a price for crude, refined and alloyed platinum, following which notice will be given producers and dealers and blanks issued governing delivery and distribution. The following list indicates in general the order of preference which will be followed in releasing platinum for shipment: No. 1, military needs of the United States Government; No. 2, military needs of Allied governments; No. 3, essential commercial purposes.

—

Standard Parts Holds Sales Convention

CLEVELAND, March 4—The first annual sales convention of the Standard Parts Co. was held in the Hollenden Hotel here Feb. 25, 26 and 27, and was attended by the entire sales organization of the company and many of its executives. The meetings were addressed by President Christian Girl. Director of Sales D. C. Swander was in charge of the gathering. Following the meeting on Monday there was a banquet, and on Wednesday three of the plants of the company were inspected.

First annual convention of sales representatives of the Standard Parts Co., held in Cleveland, Feb. 25 to 27

Chamber of Commerce Urges Return Loads

Bulletin Sent to All Local Boards Affiliated with It Calling Attention to Plan and Advocating Its Adoption

WASHINGTON, March 2—The Chamber of Commerce of the United States is issuing a bulletin to all of the boards of commerce affiliated with it in the country calling attention to the return load plan of motor truck transportation. The bulletin reads as follows:

"The motor truck is a part of the transportation equipment in every community. Its use more nearly to capacity will help solve local problems.

"More complete use means loads both ways. A motor truck usually carries a good load to its destination, whether the destination is in the same community or in another city. Too often, however, the truck makes the return trip with no load. Every time this occurs there is waste of at least half the capacity of a truck to do work in transportation.

"Owners of trucks do not wish half the earning power of their vehicles to be lost. Manufacturers and merchants with goods piled up and awaiting shipment do not like to see empty trucks pass their doors. Both need a local clearing-house for information about the trucks that are available and the shipments that are ready, i.e., to bring together loads and empty trucks.

"Such a clearing-house the local commercial organization can easily provide. It will not ordinarily entail any special expense. It will promote co-operation in the community. It will render a very real service for which business men will be thoroughly grateful.

"Return-Load Bureau is a convenient name for a clearing-house. The bureau should ascertain the established lines of trucks that run regularly on fixed routes and the part of their capacity that is not being utilized. It should then obtain information from all owners of trucks used for private hauling, getting statements about the capacity of each truck, how far its capacity is used, between what points the capacity is unused, if the unused capacity can be made available for other persons at a reasonable price, etc. Besides gathering this information, the bureau can make known to everyone that whenever a truck is to make a trip without a load the bureau will respond to a telephone inquiry by endeavoring to give the name of a person who wants to send a load over the route in question. Efforts can be made also to have drivers who bring loads by truck from other points telephone to the bureau in order to get return loads.

"At the same time the bureau can enlist the co-operation of business men who may have shipments to make.

"In order that any driver or other person from out of town may quickly ascertain if there is a return load for him, each bureau should be specially listed in the telephone directory.

"With incidental questions the bureau will not usually need to deal. For example, it can leave the compensation that is to be paid to negotiation between the parties.

"In England return-load bureaus have proved of great assistance. They have been most developed in the United States by commercial organizations in Connecticut. Experience has demonstrated that the assistance they can render is very real and important, and that they can be organized advantageously in many communities where they have not as yet been tried."

—

Edmunds & Jones Earns $417,034

DETROIT, March 2—The Edmunds & Jones Corp. earned net profits of $417,034 during 1917, before deduction of war taxes. After the dividends were paid, a surplus of $168,791 remained for the year. The output of lamps from the Detroit plant aggregated 2,798,842 as against 1,897,043 in 1916. The output of the Canadian plant was 338,293. Orders on file in the Detroit plant amount to $800,000. The combined income account of the Edmunds & Jones Corp. and subsidiaries follows:

	1917	1916	Changes
Gross sales profit.	$516,303	$637,278	*$120,975
Other income	112,354	110,545	†1,809
Total income..	$628,657	$747,822	*$119.165
Selling exp., etc..	211,623	185,896	†25,727
Net profit	$417,034	$561,926	*$144,892
War taxes.....	79,908	.....	†79,908
Balance	$337,126	$561.926	*$224,800
Pfd. dividends ...	48,335	51,625	*3,290
Com. dividends..	120,000	120,000	.....
Surplus for year.	$168,791	$390,301	*$221,510

Commandeer Spruce for Airplanes

WASHINGTON, March 3—The War Department has given the Aircraft Production Board the authority to commandeer spruce in the northwest wherever it may be found in order to hasten the government aircraft program.

—

Scripps Shipping 1918 Cars

DETROIT, March 1—The Scripps-Booth Corp. has made the first shipment of 1918 cars to Pittsburgh and other eastern points. The shipment consisted of 4 carloads, containing 20 cars. Production for 1918 is expected to reach a total of 12,000.

—

Airplane Program Ahead of Schedule

WASHINGTON, March 2—Thirty representatives of airplane and engine manufacturers called to Washington to report progress on the air program told Secretary of War Baker they were abreast of the program and that some of them were ahead of it. With Secretary Baker they went over the program on training, advance training and combat planes. They were addressed at the meeting by the Secretary; Howard E. Coffin, chairman of the aircraft board; Maj. Gen. Squiers and Col. Deeds, of the aviation section of the Signal Corps. Secretary Daniels and Admiral Benson also congratulated them on their splendid progress.

—

Western Carburetor to Increase Output

ALMA, MICH., March 3—The present output of the Western Carburetor Co. is 30 carburetors a day, but this will be increased to 200, as soon as the working force is completed. At the stockholders' meeting held last week, the following officers were elected: President, Albert Frevert; vice-president, George J. Sandel; secretary, Harley Williams, and treasurer, Charles O. Ward. The directors appointed are Albert Frevert, Harley Williams, George Sandel, C. M. Johnson, Chas. O. Ward, P. M. Smith and J. N. Jay.

—

U. S. Truck Adding to Plant

CINCINNATI, March 4—The United States Motor Truck Co. is building a three-story brick and steel structure as a plant addition. It will be one-half block square and serve as a testing department, paint shop and final assembling shop. Later an addition one and one-half blocks square and three-stories high will be built.

—

Airplane Mail Service April 15

WASHINGTON, March 2—Airplane mail service between Washington and New York is to start April 15. Eight machines will be used and a daily schedule of one trip daily each way maintained. Machines probably will land at Van Cortlandt Park in New York. The time for the flight is estimated at 3 hours. A stop will be made in Philadelphia. Each plane it is estimated will carry 300 lb. of first-class mail.

—

General Electric Subsidiary Buys Abbott Plant

CLEVELAND, March 3—The National Electric Lamp Works of the General Electric Co. has purchased the plant and land of the defunct Abbott corporation on East 152nd Street, and the Nickel Plate tracks for a consideration of about $200,000.

The deal includes a one-story building, 110 x 681 ft., and 5½ acres of land. It is stated that the Abbott plant will be used for a machinery building.

—

Spruce Shortage in Germany

WASHINGTON, March 4—Some German airplanes captured and brought to this country reveal that Germany is running short of spruce and is making its wing beams of thin pieces, some of them less than 1 in. in thickness, put together with glue and nails.

—

To Decrease Airplane Accidents

WASHINGTON, March 3—To eliminate the many accidents at flying fields, the aircraft production board has evolved a system whereby pupils will fly in different directions from the camps to points 10 miles distant, and thus avoid collision.

Freight Embargoes Modified

Permits Now Obtainable for Motor Car Shipments Part of the Way to New York

DETROIT, March 2—The embargo placed upon the handling of motor cars by the railroads early in January has been so far modified that permits may now be obtained through the Freight Traffic Commission for a limited number of carloads when freight cars are available. The dealers are taking advantage of this privilege and shipping their cars at least part of the way when possible. Permits are frequently granted as far as Newark, N. J., or Poughkeepsie, N. Y., when they cannot be had for the whole distance.

Factories within driving distance of New York, and so placed that they can use the Lincoln Highway or good state roads, are maintaining a regular drive-away service, usually sending cars or trucks in groups of five or six only on account of the limited hotel accommodations. No regular schedule has been possible yet owing to uncertain weather and the far from perfect condition of even the best roads. In some cases no shipments have arrived since December. Four Crow-Elkhart cars were recently driven through from Elkhart, Ind., to New York, via Pittsburgh, in 5 days. Some have not been so fortunate. It is said that the road from Detroit is crowded, and that many stalled cars and wrecks are passed on the way.

Often as many as 15 or 20 Packard cars and trucks are driven through daily. Wherever possible cars are carried on the trucks. When not enough trucks are included in the day's drive cars are driven also. Little or no attempt is made to use the railroads to the eastern seaboard.

Studebaker is now driving all cars east. The last rail shipment left the factory Jan. 1 and has just arrived. Cars are also driven from New York to purchasers in other cities.

Buicks are driven in groups of five, with a captain for each group, at the rate of 20 cars a day. When possible, some are shipped to Buffalo by boat and by rail from there. The New York branch has a storehouse at Port Huron for its own use and to relieve factory congestion. The Reo company has men constantly on the lookout for possible rail shipments, but expects to drive cars overland as soon as the roads improve.

The road from Detroit to Pittsburgh is none too good. The section between Toledo and Norwalk is the worst, being badly rutted and muddy. From Pittsburgh the Lincoln Highway is followed most of the way, but even that is cut up and very hilly part of the way. Between Princeton and Rahway, N. J., it is not being used at present, a detour being made via Perth Amboy.

The route from Detroit via Cleveland and Buffalo is longer, but east of Buffalo the road is good and the large towns along the entire distance are always available in case of trouble. Roads in the Mohawk Valley, however, are apt to be flooded in the spring. Such a condition is reported now.

Michigan Stamping Earns $505,959

DETROIT, March 3—The Michigan Stamping Co. earned $505,959 in 1917. The total sale for the year is $3,419,419. This yielded a percentage of 14.8 per cent profit. As compared with a year ago this is a gain of about 80 per cent when the sales were $1,858,489 with a profit of 13 per cent. The items charged off for depreciation include $42,129 for accounts, $42,306 on the company's old plant, and $32,500 on the new plant. For machinery, fixtures and dies a total of $101,861 is charged.

The balance sheet follows:

Current Assets—		
Cash	$26,584	
Accounts receivable	365,668	
Liberty Bonds	9,350

Ohio Assn. Meeting Postponed

CLEVELAND, March 2—The annual meeting of the Ohio State Automobile Assn., which was to be held at Lima during the last week in March, has been postponed until the week of May 3. This action was taken by a referendum vote of the members, in order to permit delegates to make the trip by motor car.

Germany Building New Airplane

WASHINGTON, March 4—Germany is building a new airplane modelled on the Caproni with three separate engines and to carry one thousand pounds of dynamite. It is anticipated that this airplane will be used for bombing purposes over England.

France to Add 10% Car Tax

Horses Reduced 31% in 3 Years — Trucks and Tractors Tax Exempt

By W. F. Bradley

PARIS, Feb. 11—Under the necessity of raising war revenue the French Government is about to apply a tax of 10 per cent of the purchase price of all articles of luxury. Under this heading are included automobiles of more than 12 horsepower or of purchase price of more than $1,200.

Trucks, farm tractors and touring cars necessary for the use of professional men are excluded.

Used cars have to pay the tax if the price exceeds the limit of $1,200.

Motorcycles are elegible for the tax if their purchase price exceeds $300.

French manufacturers are finding fault with the new fiscal arrangement on account of the low horsepower limit. They maintain that this should be raised from 12 to 16. Their most important stand, however, is made against the principle of classifying an automobile as an article of luxury. They maintain that the vast majority of automobiles are used for utility purposes, and while there may be an element of pleasure in the use of an automobile that is only an incidental in the great movement.

It is pointed out that owing to the war the number of animals is being reduced at an alarming rate. Between 1913 and 1916 the number of horses dropped 31 per cent; donkeys and mules, 14 per cent; oxen dropped 30 per cent, and cows 20 per cent. The official figures showing the number of cattle in France on these two dates are as follows:

	1913	1916
Horses (more than 3 years old)	2,550,000	1,682,000
Donkeys and mules	544,000	470,000
Oxen	1,843,000	1,260,000
Cows	7,794,000	6,200,000

In order to meet these losses gasoline tractors and automobiles will have to be used on the land in a measure altogether unknown prior to the war. While it is not proposed to tax this agricultural machinery, it is impossible to put a tax on any one branch of the automobile industry without affecting the whole.

The matter is also being looked upon from a national standpoint, for France possesses, in the hands of private owners, 160,000 automobiles of a capital value of $320,000,000. These 160,000 are made up of 115,000 privately owned touring cars paying direct taxation, 15,000 taxicabs and others paying indirect taxation, and 30,000 commercial vehicles not subject to taxation. Motorcycles are not included in these figures.

Until the outbreak of the war France occupied the position of leading automobile export nation of the world, and her manufacturers are anxious that there shall be no system of taxation which

Digitized by Google

shall handicap her in the keen competition which will take place when the war is over. In 1913 the French automobile export business stood at $45,600,000; America came second with $33,000,000; England third with $28,000,000; Germany fourth with $21,600,000, and Italy fifth with $7,200,000.

—

Aluminum Price Fixed at 32 Cents

WASHINGTON, March 4—The price of aluminum has been fixed by presidential proclamation at 32 cents per pound; last month the metal reached its lowest price during the past year, when it touched 36.4 cents, the average for the year being 51.59 cents and the high figure 60.77 cents. The fixing of the price has been made after investigation by the Federal Trade Board as to cost of production, and is the result of an agreement made with the producers. The price is subject to revision June 1. The new price is to cover lots of 50 tons and over of ingots of 98 to 99 per cent grade. The usual stipulations that producers shall maintain production, not reduce wages, sell to the Allies and the public at the same figure and prevent the metal from falling into the hands of speculators are made.

Most of the aluminum produced in the United States comes from Georgia, Alabama, Arkansas and Tennessee, these four states producing 425,359 tons of bauxite, from which the metal is extracted. A limited amount of cryolite ore comes from Greenland and Iceland. Following are production figures:

1916		1917	
Tons	Value	Tons	Value
68,000	$33,900,000	*80,000	$45,882,000

*Approximate.

MacMullen Chevrolet Sales Manager

FLINT, MICH., March 4—John S. Collins has resigned as sales manager of the Chevrolet Motor Co. He will be succeeded by B. J. MacMullen, who was sales manager of the Chevrolet Motor Co. of Texas, with headquarters at Fort Worth.

20 Per Cent Drop in Exports

January Amount $2,097,633 Less Than December—More Trucks Shipped

Mos.	Cars	Value	Trucks	Value	Parts
Jan.	4,325	$3,841,871	1,156	$3,328,870	$2,665,278
			1917		
Dec.	6,442	5,375,706	825	1,585,481	4,952,465
Jan.	4,733	3,860,224	1,340	3,515,210	2,194,312

WASHINGTON, March 6—Exports of automobiles, commercial vehicles and parts, not including engines and tires, from the United States, amounted to $9,816,019 in January. This is $2,097,633 or 18 per cent less than the December amount, the record month of the year; but $447,273 or 5 per cent more than the January, 1917, amount.

There was a great reduction in the number and value of passenger cars shipped, practically every foreign country purchasing less than half of its December amount. France received only 19, as compared with 285 in December. Canada's allotment was 692, compared with 1852 in December. New Zealand alone increased its orders, the January number being 221 and the December number only 71.

The cars sent to the United Kingdom are much higher priced than those sent to Canada, the average cost being $3,500 for the former, and $800 for the latter.

There was an increase in the number of trucks exported. The December figure was 825, and in January 1156 were shipped. This gain is due to a shipment of 622 trucks to France. Truck shipments to other countries remained practically the same.

The value of parts, exclusive of engines and tires, exported decreased from $4,952,465 in December to $2,665,278 in January.

—

Reo Completes First Holt Tractor

LANSING, MICH., March 4—The Reo Motor Car Co. has completed the first of the Holt caterpillar tractors for a government order recently received. The order calls for 3000, and the sample tractors just completed have been passed by Lieutenant H. C. Shafer of the Ordnance department, who is in charge of inspection in Lansing.

The Reo company will assemble tractors for the government during the next 60 days on a large production scale. The first 3000 of these to be turned out by the Reo company are but a forerunner of larger contracts to follow. It is planned to motorize the entire ordnance department, and this will keep the motor car factories working on a chain of contracts.

—

B Truck Parts Delivered

WASHINGTON, March 7—Up to this time complete sets of parts for the Class B truck to the number of 210 have been delivered to the fourteen factories engaged in their assembly. It is expected that 1000 complete sets of these parts will be delivered by April 1, following which there will be a steady production with the schedule completed sometime in July.

—

Fisher Body Earns $999,826 in 3 Months

DETROIT, March 4—The Fisher Body Corp. reports earnings and income from all sources of $999,826 for the quarter ending Jan. 31, 1918. After $42,611 is deducted for interest on the floating debt, but before income and excess profits taxes are deducted, a surplus of $957,015 remains.

The consolidated income account for the 9 months from May 1 to Jan. 31, 1918, shows total earnings and income from all sources of $2,809,645. Interest on the floating debt reduces this to $2,697,925.

—

Maxwell Establishes Central Warehouses

DETROIT, March 6—The Maxwell Motor Sales Corp. has established warehouses in Buffalo, Indianapolis, Cincinnati and Chicago, and expects to establish one in Pittsburgh, where the company plans to drive 200 cars each month.

These warehouses will serve as central stations for certain sections of the country and freight deliveries will be made from them.

The Maxwell drive-away system has been organized on an extensive plan. Last week between 600 and 700 vehicles, mostly loaded trucks, left the factory for Ohio, Illinois, Indiana and a number of eastern points, particularly the southern section of Pennsylvania.

—

Woods Lieut. Colonel in Signal Corps

WASHINGTON, March 5—Arthur Woods, former Police Commissioner of New York City, has been appointed Lieutenant Colonel in the Air Section of the Signal Corps.

—

Ordnance Base to Have Repairshop

WASHINGTON, March 6—The ordnance base costing $25,000,000 which is being erected in France will include a motor vehicle repair plant capable of overhauling 1200 vehicles a month. Four hundred and fifty officers and 16,000 men will be required for the entire base.

—

650 Townsend Tractors in 1918

JANESVILLE, WIS., March 5—The Townsend Mfg. Co., maker of oil tractors and engines, will increase its output to 650 or 700 tractors for 1918. Several plant additions are being erected to increase facilities for production.

Gain in New York Exports

72 Per Cent of Total Shipments of United States Sent Through This Port

NEW YORK, March 6—Exports of automobiles, trucks and parts from this port during January amounted to $7,021,661, or 72 per cent of the total exports from the United States.

The shipments to Canada were made by railroad, not one car being shipped there from the port of New York. Few cars are sent to the Far East from New York, none being shipped to the Philippine Islands, Dutch East Indies or British India, although all received a goodly number from the United States during January.

Australia's cars, on the other hand, came mainly from New York, 851 of the total 931 being sent via this port. Shipments to South America vary. Ninety per cent of the cars sent to Chile went through New York, but half of Argentina's cars were either sent overland or shipped from another port.

There was a slight gain in New York exports over the December amount.

—

Fourteenth Packard Train Starts

DETROIT, March 1—The Packard Motor Car Co. yesterday started eastward its fourteenth army truck train since Dec. 14. This is made up of 30 trucks, some of them loaded with Packard and Dodge parts. In a short time army truck trains will carry capacity loads of steel ranges for the army cooks.

Last week a driveaway of 36 Packard twin sixes and trucks left the factory. Seventeen of the trucks had mounted on them either another truck or a passenger car. The train is expected to complete its run of 780 miles in 12 days. The route will be the same as that traversed by the army trains as far as Gettysburg, where the train will switch to a more northerly course to New York.

—

Cars, Trucks and Tractors at Indianapolis Show

INDIANAPOLIS, March 4—The seventeenth annual show of the Indianapolis Automobile Trade Assn., which closed yesterday, was the most successful exhibit in the history of the organization, and included displays of cars, trucks, tractors and accessories. Dealers say that more prospective buyers attended than in former years. The show was held in the industrial plant of the Diamond Chain & Mfg. Co., and 48,000 sq. ft. were devoted to exhibits.

There were 258 displays, including 38 makes of passenger cars, 20 of trucks and 11 of tractors. The latter appealed chiefly to the numerous rural visitors who attended the show. It is predicted that the demand for tractors will be so heavy that dealers will be unable to supply it.

—

100,000 Men in Flying Section

WASHINGTON, March 5—One hundred thousand aviators and mechanics now form the flying section of the Signal Corps. More than 5000 fliers have been graduated from the ground schools in this country and 5000 are now taking the course. More than 10,000 additional students are awaiting an opportunity to enter the schools.

—

Elgin Assets $1,035,906

CHICAGO, March 2—The balance sheet of the Elgin Motor Car Co. for the fiscal year ending Dec. 31, 1917, shows assets of $1,035,906. The full quota of cars will be built by the company in 1918.

—

Carlton, Bosch Chicago Manager

SPRINGFIELD, March 1—Lee C. Carlton, for the last 17 months manager of the San Francisco branch of the Bosch Magneto Co., is now manager of the Chicago branch, succeeding W. Norman, who has been appointed factory manager at Springfield, Mass.

—

Report Liberty Plane Flies Over Capital

WASHINGTON, March 5—Although it is impossible to secure confirmation from the Aircraft Board or the Signal Corps, there are fairly substantial reports that a Curtiss airplane which flew

over Washington yesterday was fitted with a new Liberty engine. It is expected that several airplanes equipped with Liberty engines will be stationed at the hangar, near the Washington Navy Yard, and that flights over the city will be frequent.

Newspaper reports that four Liberty airplane engines are being tested in the basement of the Union Depot here are incorrect. The rumors are due to tests of the Liberty motor trucks made in the basement of the Union Depot. It is reported, however, that the Liberty airplane engine has been given thorough tests in an especially constructed room at the Bureau of Standards.

—

Photograph Government Employees

DETROIT, March 4—In accordance with the request of the Government, the heads of all industrial establishments with their employees must be photographed and listed for identification. The work has just been completed at the Ford factory, where every one from Henry Ford down was photographed by the official photographer. Five photographs, it is understood, are to be made of each man. Each man is to be known by a number and when photographed he must carry his number on his chest. Two of the photographs are to be retained by the employer, one by the Government, one by the police and the other serves as an identification card for the man.

—

Parachutes for Dropping Mail

WASHINGTON, March 2—The Post Office Department is considering a scheme for dropping mail from airplanes by parachute in connection with the proposed airplane mail service between New York and Washington.

—

U. S. to Have 4 Aviation Departments

WASHINGTON, March 5—The United States has been divided into 4 aviation departments. The eastern department will have headquarters at Governor's Island; the southeastern department headquarters will be at Atlanta; those of the southern department will be at San Antonio, and of the western and central department at Chicago. An aviation officer with rank of brigadier-general will be placed in charge.

—

Cannot Control Price of Patented Articles

WASHINGTON, March 5—The prices of patented articles cannot be controlled by the patentee according to a decision just rendered by the Supreme Court. This interpretation of the patent laws was made by the court in answering questions certified by the lower courts in injunction proceedings restraining the Boston Store, Chicago, from selling records in violation of a contract made with the American Gramophone Co. for less than list prices. The opinion affects retail dealers bound by similar contracts in which the resale price is fixed by the manufacturer.

Earns 49 Per Cent on Common

Kelly-Springfield Shows Profits of $4,323,955 in 1917—30 Per Cent More Than 1916

CLEVELAND, March 6—The Kelly-Springfield Tire Co. earned gross profits of $4,323,955 in 1917, an increase of 30 per cent over 1916. After deduction of preferred dividends but before deduction of war taxes, this amounts to $12.40 a share on the common stock ($25 par). After deducting dividends, interest and reserve for sinking fund and profit sharing, a surplus of $1,453,585 remains. This is 50 per cent more than the surplus of $957,571 on Dec. 31, 1916.

Assets totaled $15,395,835 and current liabilities amounted only to $1,273,701, leaving a net working capital of $14,122,134.

Following is the income account for 1917, as compared with that of 1916:

	1917	1916
Gross profit	$4,323,955	$3,464,459
Operating expenses	1,720,335	1,404,388
Net operating income	$2,603,620	$2,060,071
Other income	45,293	57,243
Net income for year	*$2,648,913	$2,117,314
Preferred dividends	213,078	215,932
Common dividends	785,152	735,316
Interest	.....	10,800
Sinking fund	75,164	85,964
Profit sharing	121,934	111,731
Surplus	$1,453,585	$957,571

*After $213,078 preferred dividends, the balance of net income was equal to $12.40 a share on $4,907,200 common stock ($25 par).

The balance sheet as of Dec. 31, 1917, compares as follows:

ASSETS	1917	1916
Cash	$772,448	$983,512
Notes receivable	195,917	52,732
Accounts receivable	1,552,431	1,850,585
Bond sinking fund	.....	147,851
Inventories	3,760,162	2,218,142
Preferred stock sinking fund	.....	.....
Deferred charges	52,189	22,374
Liberty bonds	272,353	.....
Plant, goodwill, etc.	8,781,776	7,887,357
Treasury stock	.....	.....
Stock purchased	*8,560	.....
Total	$15,395,835	$13,162,552
LIABILITIES		
Preferred stock	$3,509,300	$3,593,300
Second preferred stock	.....	.....
Common stock	4,907,200	4,907,200
Notes payable	600,000	.....
Accounts payable	235,752	187,911
Debt bond sinking fund	.....	270,000
Reserve for taxes, payroll, etc.	78,961	98,328
Preferred dividend payable	52,639	53,899
Interest payable	.....	10,800
Loan pay—Liberty bonds	231,185	.....
Stock and bond redemption fund	75,164	233,815
Miscellaneous liabilities	.....	350,559
Surplus	5,705,633	3,456,740
Total	$15,395,835	$13,162,552

*Represents difference between $484,960 common stock purchased for resale to employees and $476,400 special loan which will be self-liquidating by employees' instalment payments under stock profit-sharing plan.

—

Michigan Copper Earns $60 a Share

DETROIT, March 2—Net earnings of the Michigan Copper & Brass Co. for the year ending Dec. 31, 1917, were $596,819.41, amounting to $60.20 a share. The company has declared a 3 per cent dividend, payable April 1 to stockholders of record March 15.

The following directors were elected at the recent stockholders meeting: David M. Ireland, James T. Whitehead, Hal H. Smith, Alonzo P. Ewing, Bernard G. Koether and W. B. Wallace, all of Detroit; C. S. Mott and Walter P. Chrysler, Flint; Alfred P. Sloan, Jr., New York. The officers were re-elected by the directors.

—

Higrade Motors Ready for Production

HARBOR SPRINGS, MICH., March 4—The Higrade Motors Co. is ready to start production. A preliminary schedule of 25 cars has been arranged and materials are now at hand for these. The materials for another 100 cars are practically all in and indications are that a producton of from 20 to 25 of the light trucks will soon be made weekly. According to present indications this production will start about March 1.

—

Maxwell Changes Coast Distributer

LOS ANGELES, March 3—The Southwest Motors has been appointed southern California Maxwell distributer. The move has occasioned considerable surprise among dealers. Up to the present time Maxwell has been handled by the Lord Motor Car Co., which has had the line for the last 5 years. The Southwest Motors was organized less than a year ago and is occupying part of the building erected for Harold L. Arnold.

—

Federal Reduces Shipping Space

DETROIT, March 4—The Federal Motor Truck Co. has succeeded in knocking down its Class B army truck to such a degree that when it is boxed for overseas shipment it will occupy only half the space it formerly used, thus saving 50 per cent shipping space. This box is of the smallest proportions any manufacturer was able to attain in knocking down a truck of this capacity, and it is believed the Government will accept this as a standard.

—

Warner Trailers for Ammunition Trains

BELOIT, Wis., March 2—The Warner Mfg. Co. has for the past three months been working on a government contract for heavy-duty Warner trailers, to be used in ammunition trains. They are a standard type Warner 4-wheel model, and follow regular specifications except that U. S. Standard pintle-eye is used in place of the Warner ball and socket hitch.

—

Aerial Repair Base in Cleveland

CLEVELAND, March 4—The Government will establish an aerial station here, not as a training station, but as a supply and repair base for government airplanes, which are making test flights. Alva Bradley, chairman of the airplane committee of the Cleveland Chamber of Commerce, is arranging for a site and the erection of hangars and machine shops. He has appointed sub-committees to assist him.

Summer Business in Argentina Good

Uncertainty of Export Conditions and Movement of Crops Holds Back Sales Slightly

BUENOS AIRES, ARGENTINA, Jan. 30—Business during the summer which is just closing has been very satisfactory, although the number of cars sold by some dealers has not been as great as was expected. The wheat crop is good, but there is much uncertainty surrounding its movement on account of the Argentine attitude towards the Allies. This, together with the uncertainty about export conditions, is holding up what would otherwise be a good selling period throughout the country. It is very possible that the import tax on automobiles will be increased 25 per cent. This will apply to tires, parts and accessories, and will make sales more difficult.

The great loss of horses due to the war is bound to stimulate the sale of motor trucks, but such developments are coming slowly in this country. Road conditions are not favorable for truck use.

The continuous railroad strikes, in which practically all of the railroads of Argentina were concerned, entirely stopped shipments, and automobile sales were very much affected for several months. They are beginning to recover from this setback.

Practically all of the business here is with American cars, although there still are some European machines of such makes as Fiat, Mercedes, etc., which have not been sold, some of them since before the start of the war, and the Fiats since the time Italy entered the war. Nobody cares to buy these cars because they fear they cannot get spare parts for them.

There is a general feeling that the question of the 56-in. tread in Argentina has not yet been solved, due to the feeling that the farmers in the country want the wide treads, but are obliged to buy 56-in. treads. There is a strong feeling that as soon as the war is over some European factories will furnish models with the 62-in. tread.

A few Buenos Aires dealers have been manufacturing bodies for high-priced American cars, the Cadillac being an example. Fehling Bros. have been building bodies in their own shops, due to the high shipping expenses and also shortage of ocean tonnage.

—

Compute Cost of Drive-Aways

WASHINGTON, March 2—Statistics of the cost of drive-aways from Michigan to the Capital have been compiled by dealers here. An Oakland car drive-away from Pontiac requiring 5 days, and covering 600 miles, cost $70. A Hupmobile drive-away from Detroit averaged $85 a car and required 6 days, the increased time and expense being due to weather conditions. Several Federal trucks made the trip from Detroit in 12 days, at a cost of $130 per truck.

—

Drive-Aways for 75 Per Cent of Paige Production

DETROIT, March 4—The Paige-Detroit Motor Car Co. is reorganizing its drive-away system so that 75 per cent of its production can be sent overland. The company is driving away only 20 per cent.

Great Reduction in London Traffic

Only 25 Per Cent of What It Was 3 Years Ago—Motor Industry Quiet

LONDON, ENGLAND, Feb. 6—London traffic to the motorist who has not been here for several years does not exceed 25 per cent of what it was 3 years ago. Despite the fuel difficulties there are many more motor vehicles on the streets than horse vehicles, and only a comparatively small number of vehicles driven by the gas bags.

Here the automobile industry is extremely quiet and there seems to be very little in the way of after the war schemes, although it is certain that there will be some high protective measures in force for several years after peace is signed. Just at the present all of these after the war measures as relating to the automobile industry seem to be entirely shelved, and the whole country is engrossed in the one thought of winning the war. The manufacturers appear to be relying entirely on either the continued prohibition of imports of motor vehicles or a very high tariff.

There is very great interest in the American aviation program, and the Liberty engine is looked forward to being one of the important factors in the war.

—

Regal to Make Shells for Government

DETROIT, March 2—The Regal Motor Car Co. has received a government contract for the manufacture of 300,000 3-in. shells. These will be made at the Jamestown, N. Y., plant.

Industrial Review of the Week

A Summary of Major Developments in Other Fields

Divergent Interests Among Iron Producers

NEW YORK, March 6—The New York conference of iron and steel manufacturers on March 1, attended by about 75 representatives of the industry, brought out plainly the divergent interests of large and small producers, as affected by Government prices. While the Steel Corporation and some of the larger independent companies would probably accept without complaint a continuance of present prices, smaller producers in several lines, notably plates, show advances in cost on which they contend strongly for higher Government prices after March 31.

The increased costs of some large companies were as much as $6 a ton between Dec. 31 and Jan. 31, and when account is taken of to-day's restricted scale of operations the increase since the first announcement of Government prices late in September is put in some cases as high as $10 a ton.

For the Washington conference with the War Industries Board, which will probably be in the third week of March, various manufacturers are preparing individual statements showing the reduced profits of recent operations and the prospect of a very considerable falling off in 1918 from the results of 1917.

Consumers of iron and steel have thus far taken no steps to have their varied interests represented at Washington. There has been some agitation on behalf of Northern users of Southern pig irons for a reduction in such irons so that they may be had at delivered prices comparing with those of Northern irons.

What is increasingly commented on in the trade is the small volume of buying for uses having no connection with the war. Some forms of finished steel may become quite plentiful.—*Iron Age.*

—

Roads Bad For Drive-Aways

NEW YORK CITY, March 6—It will be nearly a month before all of the main highway between Buffalo and Albany, which is the route over which war trucks are being driven from the Pierce-Arrow factory to seaport, will be free of snow and in ideal condition, according to R. H. Johnston, New York manager of the White Co., who made an investigation trip over the route from New York City to Albany and thence west as far as Little Falls. Due to snow on the road between Albany and Little Falls, 80 miles, it took longer to make this distance than the 150 miles up the east side of the Hudson from New York City to Albany.

Through the Mohawk Valley which stretches westward from Albany the snow is still 6 to 12 inches deep and there are frequent drifts with snow 4 to 6 feet deep. The men driving war trucks through have literally cut channels through these drifts, and if it had not been for their work it would still be impossible to get through with a touring car. The road is filled with deep ruts which constantly weave from side to side of the highway.

Long before Mr. Johnston reached Little Falls, however, he had decided that the driving of cars and trucks over this route for delivery to customers is quite out of the question at this time. Cars and trucks can be brought through but the inevitable damage to the finish of passenger cars and the wear on tires of trucks would be more than the customer would reasonably expect. Possibly, one week from now, or two weeks from now, conditions will be much improved, but the present conditions, as we see them, make advisable some postponement of "drive-aways."

A New Service

¶ Herewith AUTOMOTIVE INDUSTRIES *supplies for the benefit of its readers a general summary of important developments in other fields of business. This is rendered possible by the editorial co-operation of leading industrial publications which are recognized authorities.*

By compressing the general industrial situation into this form we hope to give our readers a clear and comprehensive idea of up-to-the-minute developments which they could otherwise secure only with considerable expenditure of time and effort.

Harding Director of Wagner Axle

ANDERSON, IND., March 6—H. P. Harding, formerly president and general manager of the Wagner Axle Company, manufacturers of the Liberty Worm Drive Axle, Anderson, has resigned, and G. D. Yaeger has been elected by the board of directors of the company to the office of general manager, in addition to secretary and treasurer, and has now taken up the added duties of general manager.

—

Changes in Whitman & Barnes Sales Department

AKRON, OHIO, March 6—A. B. Hall, vice-president of the Whitman & Barnes Mfg. Co., will have charge of the company's sales. R. S. Carter, district representative in Pittsburgh, has been promoted to sales manager, and will have direction of the Twist Drill and Reamer sales. H. E. Fisher, formerly with the Pittsburgh Model Engine Co., will succeed Carter as mechanical engineer, with charge of sales in the Pittsburgh district. Paul E. Thomas is sales manager in charge of the department of wrenches and spring cotters.

Country Laying Plans for Next Season's Coal

A sure sign that fuel troubles are almost over for the present is evidenced by the fact that the country as a whole is now laying plans for next season's requirements instead of worrying about immediate needs. Even the situation in New England shows signs of improvement, better weather having enabled the movement of more coal from the southern tidewater ports via all-rail and Long Island Sound. Beyond Portland, however, the ports are still closed by ice. The shortage of vessels also continues to be a deterrent.

Though transportation conditions in general show marked signs of betterment, much of the freight congestion having been cleared away, there are still well-founded complaints of a shortage of empty cars at the mines.

Receipts of anthracite at tidewater are more plentiful; but the demands for this, as well as for any grade of coal, are still strong. Bituminous coal is extremely short. The output in January was the lowest for any month since September, 1914, owing to inadequate car supply and railroad congestions. "Give us more cars, and we'll flood the country with soft coal," say the bitumimous operators.

Prices for the most part are based on contracts entered into before the Federal price regulations went into effect, and there is little, if any, spot coal offered. No new contracts are reported, the trade evidently waiting for the announcement of the new price schedule promised by the Fuel Administration before April 1.

The anticipated elimination of the jobbers' commission has caused much criticism, as it is considered that this branch of the trade performs an important function.

Great care is still necessary in distribution and consumption, as no great reserve stocks of coal exist. Bunkers and bins were scraped bare during the past three months, and coal will neither be cheap nor plentiful this year.—*Coal Age.*

Truck Show in Brooklyn

BROOKLYN, N. Y., March 5—The first and only Greater New York show at which trucks were exclusively shown this season opened to-day in the Twenty-third Regiment Armory. Despite war conditions this is a larger show than last year, which was a record breaker. There are 102 chassis on view, representing 32 makers. There are also five styles of Ford adapters and two booths devoted to bodies.

The great majority of the exhibitors are truck dealers in the Metropolitan territory, and most of these are from New York City. Some Brooklyn dealers are represented and there are a few direct factory exhibits.

Men of the Industry

Changes in Personnel and Position

Bowman General Manager of Acason Motor Truck Co.

DETROIT, March 2—J. F. Bowman has been elected vice-president and general manager of the Acason Motor Truck Co. He was formerly vice-president and sales director of the company, prior to which time he was sales manager for the Federal Motor Truck Co. H. A. Conlon has been promoted from assistant sales manager of the Acason company to sales manager. He was formerly assistant sales manager of the Federal company.

—

P. D. Sampsell has been placed in charge of sales of United States trucks in Indiana, Ohio and West Virginia. His headquarters will be in the Severn Hotel, Indianapolis.

J. C. Schmitz and **Robert H. Scott** have been appointed district representatives of the Dart Motor Truck Co., Waterloo, Iowa. Schmitz will handle sales in Oklahoma and Texas, and Scott those in New York and Pennsylvania.

Millard N. Newton, who has been connected with the advertising department of the White Co., Cleveland, for 5 years, has been appointed advertising manager.

J. Welch has been appointed western sales manager of the Freuhauf Trailer Co., with headquarters in Kansas City. He was formerly associated with the Abbott Corp. and the Inter-State Motor Co.

E. Wooler has abandoned the small car proposition on which he was working, and has returned to the Chandler Motor Car Co., Cleveland.

F. H. Burdette, formerly Pacific Coast manager of the Four Wheel Drive Co., Clintonville, Wis., has joined the sales organization of the Hercules Motor Truck Co., Milwaukee. He will have charge of sales in the Pacific Coast district.

W. K. Frederick has been appointed sales manager of the Gryphon Tire & Rubber Corp., New York.

L. M. Field, salesmanager of the Frank O. Renstrom Co., San Francisco, has been elected vice-president of the company.

J. B. Howell of the sales department of the Bound Brook Oil-less Bearing Co., Bound Brook, N. J., has entered active service in the United States army, and is now training at Camp Dix.

Earl Cooper, who has practically given up racing for the coming year on account of the decision of the American Automobile Assn. to sanction no races during the war, will devote the greater part of his time to an agency for Firestone tires in Sacramento, Cal.

Rodney K. Haines has been appointed sales manager of the Saxon Motor Co. of New York, Saxon distributor.

John Kennedy has been appointed director of social education of the Reo Motor Car Co., Lansing.

Lieutenant Gerald Fitzgerald has been promoted to the rank of major, and is reported to be somewhere in France. He was formerly manager of the Minneapolis branch of the Remy Electric Co. and later sold Marmon and Stewart trucks.

Beckwith Havens, who until recently was foreign representative of the Denby Motor Truck Co., Detroit, is now a lieutenant in the naval aviation service.

William H. Reese has resigned the secretaryship of the Convention and Good Roads Bureau of the Milwaukee Assn. of Commerce. He will become advertising manager of the Sterling Motor Truck Co., Milwaukee.

R. W. Mickam, formerly advertising manager of the Liberty Motor Car Co., and more recently head of the advertising department of the Ford Motor Co. of Canada, has joined the Carl M. Green Co., advertising agency, Chicago.

Walter P. Coghlan, Secretary of the Klaxon Co., Newark, who at the outbreak of the war joined the United States Navy, has been honorably discharged from the service owing to an injury to his back and has resumed his duties as secretary and sales manager of the company.

—

H. Walter Staner Dead

LONDON, Feb. 27—H. Walter Staner, for many years editor of *The Autocar,* died on Sunday last from a complication of diseases which set in after a partial recovery from an attack of pneumonia. He also had editorial charge of the other automobile publications of the firm.

—

Harry R. Radford Dies

DETROIT, March 2—Harry R. Radford, well-known in automobile and club circles, is dead. He was secretary and sales manager for the Motor Car Co., organized in 1904, which company name was later styled Carter Car Co. At the time this corporation was taken over by the General Motors Co. in 1907, he became vice-president and general manager, remaining with that company until 1915. Two years ago he became associated with the Radford Block Co., Oakland distributer.

—

Changes in Velie Organization

MOLINE, ILL., March 3—The Velie Motors Corp. has made several changes in its organization. Charles R. Gardner, formerly manager of the Velie branch at Omaha, has been appointed assistant sales manager, and will be located at the Velie factory. L. H. Hazard, associated with the company for many years, has been appointed superintendent of production to succeed C. B. Rose, who was commissioned a major in the United States army. G. E. Martin will fill Hazard's place as chief engineer. F. D. Soper has been appointed purchasing agent and C. E. Mason traffic manager.

New Companies Formed

Latest additions to ranks of Automotive Industries

Organize Hebb Motors to Make Patriot Trucks

OMAHA, NEB., March 4—The Hebb Motors Co. has been organized in Lincoln to manufacture Patriot trucks of 1½ and 2-ton capacity. A factory is being built in Havelock, a suburb of Lincoln, which will be two stories high and 400 x 200 ft. As soon as the factory building is completed work will begin on a power plant, foundry and office building. It is expected that the company will be in production by fall.

—

Dealers For Concord

CONCORD, N. H., March 4—The Abbott-Downing Truck & Body Corp. has been organized to absorb the Abbott & Downing Co., manufacturer of Concord trucks, and increase the output of Concord trucks and bodies. E. E. Vreeland, who has been associated with the Fulton Motor Truck Co. for the last 2 years, has been elected president and general manager. Until the present Concord trucks were sold exclusively at retail from the factory and Boston branch, but the new company will appoint agencies.

—

Trucks Coming from St. Louis

ST. LOUIS, March 4—The Traffic Motor Truck Corp. has been organized here with $500,000 capital, and is rapidly getting into production a 2-ton truck to sell for $1,095. The company is headed by H. P. Mammen, formerly with the Westcott Motor Car Co. T. C. Brandle is vice-president and Guy Wilson, secretary and treasurer. Officials of the company say that numerous distributers' contracts have been made.

—

Four Aviation Departments

WASHINGTON, D. C., March 5.—The proposal to divide the United States into four aviation departments was declared by the War Department to-day to have no connection with the many recent fatal accidents. The change is based entirely on administrative considerations. The recent accidents will bring no new important changes other than the enlargement of flying fields already announced. It is held that a certain number of deaths must be expected. The training schedule now in force requires each student to fly nine hours with an instructor before he is allowed alone. This compares with the four-hour schedule maintained under the regulations of the allies. American flying machines to-day have had one accident to every 2400 flight hours as against one to 1400 in the flying schools of the allies.

Day-Elders Company Making New 5-Ton Truck

NEWARK, N. J., March 2—The Day-Elders Motors Corp. has brought out a new 5-ton worm-driven truck, with a chassis capacity, including the body, of 14,000 lb. The wheelbase will be either 150 or 170 in., and the truck is assembled from standard parts, including a Buda 4½ by 6-in. L-head engine, a four-speed Brown-Lipe gearbox, a Savage Arms pressed steel frame 9 in. deep and Sheldon front and rear axles. The springs are 3 in. wide in front, and 48 in. long, and rear springs are 4 in. wide and 60 in. long. The truck has Ross steering gear, and solid front tires, 36 by 5 and rear 40 by 6 dual tires. The engine is fed by gravity to a Zenith hot-air-jacket carbureter.

—

Olympian to Start 1918 Production

PONTIAC, Mich., March 2—The Olympian Motors Co. has orders for 500 of its new model cars, and expects to begin production on this model by March 25. The company shipped its last old model car a few days ago.

—

Hays Mfg. Co. Building Addition

IONIA, MICH., March 4—The Hays Mfg. Co., maker of automobile bodies, is building an addition to its plant. This is a two-story building, and will be used for finishing work.

—

Baltimore Plant for Kelly-Springfield

BALTIMORE, March 4—The Kelly-Springfield Tire Co. will erect a plant here which will cost $1,000,000. The main structure of the proposed works will be three stories high.

—

Winther Truck Building New Factory

WINTHROP HARBOR, ILL., March 4—The Winther Motor Truck Co. has started work on the erection of a new factory in Kenosha, Wis., to provide facilities for handling a government contract for military trucks. The new plant will be ready by May 15, and the company will move there from its present quarters in Winthrop Harbor.

—

Duplex Truck to Increase Production

LANSING, March 4—The Duplex Truck Co., according to H. M. Lee, president of the company, will increase its production to 300 trucks a month for the remainder of the year.

—

Hawkeye Truck Buys Factory Site

SIOUX CITY, IOWA, March 2—The Hawkeye Truck Co. has purchased a 5-acre tract here for a new factory, and construction work will begin as soon as plans can be drawn. The building will be 75 by 300 ft., and will have the saw-tooth roof style.

—

Jackson Munitions Ready to Start Production

JACKSON, Mich., March 2—The Jackson Munitions Corp., which has practically closed contracts for the old Mutual Motors Co. plant, is planning to start active operations in manufacturing shells by April 1. Two-thirds of the factory will be devoted to this work and between 800 and 1,000 men will be employed.

Production of shells will start within a week at the plant of the Jackson Automobile Co. Other plants that will engage in the manufacture of shells are the Jackson Cushion Spring Works, the Sparks-Withington Co., and the Mott Wheel Works. A committee of real estate men is making a canvass of the housing situation here so that homes may be obtained for the hundreds of men who will be brought to this city. Employment will be given to all available local workmen first.

—

McNaull Shipments by Truck

TOLEDO, Ohio, March 2—Because of the difficulty in getting sufficient freight cars to make shipments to the east, the McNaull Tire Co. has started two motor trucks, loaded with tires, to New York and Paterson, N. J. If the experience is a success it is planned to put other trucks into service to make long haul deliveries.

—

20 F. W. D. Trucks Daily

CLINTONVILLE, WIS., March 2—The Four Wheel Drive Auto Co. is now manufacturing between 20 and 25 complete 3-ton trucks a day. The government has erected barracks near the factory where 200 officers and men of the ordnance department make their headquarters when receiving instructions in the operation and care of the F. W. D. trucks in the established school of the plant. The course lasts 4 weeks for privates and 3 weeks for officers.

—

Martin Aircraft Plans Building

CLEVELAND, March 3—Plans for the Glenn L. Martin Aircraft producing building were filed with the city building department. It is reported that a site will be selected shortly and that the building will be rushed to completion.

—

Goodyear Marketing Cord Patch

AKRON, Ohio, March 1—The Goodyear Tire & Rubber Co. is placing on the market a cord patch for repairing inside breaks and injuries in cord tires. The patch is built of several layers of cords, the same construction being used as in cord tires. Edges are tapered to prevent tube chafing and the patch is inserted in the same way as an ordinary blowout patch, the surface in contact with the shoe being skim-coated with a layer of uncured gum.

Current News of Factories

Notes of New Plants—Old Ones Enlarged

Buda Engines Made by Other Companies for U. S.

HARVEY, ILL., March 2—The Buda Co. has licensed the United States government to contract with outside manufacturers for the production of Buda "HU" 4-cylinder 4¼ x 5½ in. engines. This engine has been adopted as a standard for certain government vehicles for the duration of the war, and the output of the Buda company is not sufficient for government requirements. Outside companies manufacturing these engines will be permitted to sell them only to the United States, and not to private organizations.

—

Gillette Rubber Increases Output

EAU CLAIRE, WIS., March 4—The Gillette Rubber Co. is increasing its output from 500 tires to 1500 tires a day. Before the close of summer it is hoped to bring the capacity up to 2000 tires a day.

—

Kissel Erecting Additions

HARTFORD, WIS., March 5—The Kissel Motor Car Co. has awarded contracts for the erection of two factory additions to provide extra facilities for handling the government contract for military trucks.

—

DIVIDENDS DECLARED

INDIANAPOLIS, March 2—The Stutz Motor Car Co. has declared a quarterly dividend of $1.25 a share on common stock, payable April 1, to stockholders of record March 15.

—

DETROIT, March 2—The Packard Motor Car Co. has declared the regular quarterly dividend of 1¾ per cent on preferred stock, payable March 15 to stock of record February 28.

—

BUFFALO, March 2—The Pierce-Arrow Motor Car Co. has declared the regular quarterly dividend of 2 per cent on preferred stock, payable April 1 to stockholders of record March 15.

—

CHICAGO, March 2—The Union Carbide Sales Co. has declared a regular quarterly dividend of 2 per cent, payable April 1 to stock of record March 12.

—

AKRON, Ohio, March 2—The Firestone Tire & Rubber Co. has declared the regular quarterly dividend of $1.25 a share, payable March 20 to stock of record March 10.

—

NEW YORK, March 4—The Linde Air Products Co. has declared a regular quarterly dividend of 2 per cent on common stock and 1½ per cent on preferred stock, payable March 30 to stockholders of record March 20.

—

CHICAGO, March 4—The Stromberg Motor Devices Co. has declared the regular quarterly dividend of 75 cents a share on common stock, payable April 1 to stock of record March 15.
